EGYPT. The earliest Egyptians buried their dead in earthen jars like the Babylonians, but at a very early date religion decreed the preservation of the body by embalming and the construction of a tomb of considerable size. Of the four elements composing man, the body, the double or *ka*, the soul or *bi*, and the spiritual flame or *khu*, each had to be provided for in the burial arrangements. On the preservation of the body depended the continued existence of the other three elements. The 'double' lived always with the mummy, and consumed the offerings periodically brought to its reception chamber. The soul and the spirit returned after a long period from the other world to renew contact with their former envelope. Portraits of the deceased were placed in the tomb so that they could still be recognized by them, even if the mummy were injured or destroyed. The clearer conception of the after-life in its material aspect held by the Egyptians made them develop fully what is found only in germ in Babylonia. Immediately after death,

the priest came with his assistants to take entire charge of the body and funeral. He closed the eyes of the deceased; handed his body over to the embalmers; saw to the preparation of the mausoleum with its paintings and images—if the deceased were well-to-do; engaged the mourners to parade the streets at stated intervals with loud lamentations, and directed the exhibition of family grief and the preparations for the procession. Meanwhile the embalming had been proceeding. First the viscera and heart were removed, stuffed with unguents, and placed in four jars; the brain, also, was set aside to dry, and the body placed to soak for seventy days in liquid litron or natron.

PHENICIA. The Phœnicians imagined the soul to be a restless and pitiable double, abiding either near the body of the deceased or in a gloomy under-world. The body was not fully embalmed, but was anointed and enveloped in linen bandages impregnated with substances to retard decomposition. Bodies were placed in natural grottoes or artificial chambers, or else laid in the bare earth; though they were commonly inclosed in coffins or sarcophagi, sometimes of anthropoid shape, in imitation of Egypt. Around the dead were objects of daily use and ornaments. The cippus or stele to mark the tomb developed often into a monument or chapel, especially in Hellenistic times. The early Hebrew custom is shown by Abraham's purchase of the cave of Macpela, and their occasional use of embalming in the case of the kings is proved by II. Chron. xvi. 14.

PERSIA. Among the Persians, especially the stricter following of the Magi, the ritual forbade the consigning of the body to earth, water, or fire, as these elements would thereby be polluted. The less strict Persians coated the body with a thick layer of wax and then buried it. The stricter devotees exposed it in the open to birds and beasts of prey, and the more thoroughly it was consumed by them the better the omen. The bones were then placed in an urn or a rock-cut tomb above the ground level. The soul, after dwelling near the body three days, departed on the morning of the fourth for the place of judgment. If the soul had been sinful it was accompanied over tainted plains by an evil wind and preceded by a hideous female, emblem of its evil deeds; and after being condemned in the eternal judgment hall was cast over a bridge into the abyss. The righteous soul, preceded by a beautiful maiden typifying its good deeds, passed safely, at the end of its luminous journey, into paradise.

GREECE. In the Ægean civilization the prehistoric stage is represented by some graves near Troy (Hissarlik), where the bodies were buried in simple trenches or in terra-cotta jars with utensils in stone and bone. The Mycæan Age is best represented by the royal tombs found by Schliemann at Mycæne. These were rectangular trenches cut in the rock to a depth of 10 to 16 feet, and closed by stone slabs. They were almost chambers, and held more than one body. The bodies, which may have been slightly embalmed before burial, wore all their most beautiful jewelry and ornaments or arms, and even had gold face-masks. A sculptured stele marked the site at the ground level, and the entire group was surrounded by a stone inclosure. These tombs and the other two Mycæan types, those

cut into the face of the rock and the domical tombs, are one and all family tombs, and show the universal use of inhumation, as opposed to incineration. The presence of numerous bones of many kinds of animals shows the custom of offering sacrifices to the deceased through a long period. The lavish burial with the body of the choicest costumes, ornaments, utensils, furniture, arms, and religious objects shows that the deceased was supposed to continue in the tomb itself a life analogous to his earthly one. Vaphio, Mycenæ, Palamidi, Dimini, Orchomenos, Argos (Heræum), Sparta, Menidi, Epidaurus, and the islands, such as Rhodes and Melos, have furnished every variety of such forms of burial. In the Homeric Age these primitive customs were modified, mainly by the introduction of incineration as the prevailing fashion (*Iliad*, xxiii. 164, 178; xxiv. 47-78; *Odyssey*, x. 579; xi. 27), accompanied by human sacrifices, which may have also been known in the Mycenaean Age. The burning and burying of the body forces the soul to abandon the earth for Hades. Burial was universally obligatory; its neglect by relatives a crime. The ceremony preceding burial was: The closing of the eyes and lips; the rubbing, anointing, and robing of the body; the exposure on the funeral bed in the house for a number of days, after partial embalming, with much lamentation and chanting; the burning of the body on a pyre together with the favorite animals and objects, so that they could accompany the deceased to Hades; the extinguishing of the bier with wine, gathering of the bones and ashes into urns or vases, which were buried under a mound marked by a stele; finally, a funeral repast and games.

The same material view of the future life prevailed during the succeeding historic period, although extravagances of grief and of expense and great length of exposition of the body were discouraged by law. There were four regular stages: (1) Arranging for the funeral; (2) exposition; (3) transportation; (4) burial. In preparing the body a new class of ornaments was created—rings, necklaces, diadems, brooches, amulets—too light for use and made for the express purpose of burial. It was in Asia Minor and the region of the Bosphorus especially that great luxury was attained in this branch of art. In the exposition (*prothesis*) one white covering was placed over the bed, a second one around the body, and a third over all. Noisy demonstrations and the hiring of foreign singers were forbidden. The time for the transportation of the body was toward the close of night, to avoid polluting the rays of the sun; and during it no name of a god was pronounced. The funeral bed was often crowned by a canopy, and was either carried by bearers (who were always at first the parents, but later hired men), or on a chariot drawn by two horses or mules. The laws of Solon curtailed the magnificence of the procession. The common disposition of the remains during this period was inhumation in a trench, though cremation was sometimes practiced, and the ashes then commonly placed in a bronze urn. Large necropoli were now formed by the joining of family groups of tombs—always outside the city, except in Sparta. The site of the tomb was marked in several ways—by mounds, steles, edicula, or cippi. After the burial there were libations, with the breaking of vases and figuines and the burying of objects: the continu-

ous cult of the tomb, with anniversary libations and visits, was rigorously observed. However, the absence of games and festivals, except in the case of public funerals of the greatest men, made the ceremony less conspicuous than in prehistoric times.

ITALY. The Etruscans and other early Italian races practiced inhumation at first, as is shown by primitive coffins hewn out of tree-trunks, by the persistent use of the rite of *humatio*, and by unanimous antique literary tradition. Still, the earliest necropoli yet excavated show the universal practice of incineration in the Ninth and Eighth centuries, during the 'Villanova' period. The primitive cinerary Villanova or Cabin urns containing the ashes and a few rude vases and ornaments were lowered into small cylindrical well tombs. The Seventh Century brought a change: inhumation displaced cremation, and trench tombs with long stone sarcophagi and a richer sepulchral furniture replaced the urn and well tomb. Chamber-tombs soon became the fashion, and led to the use of highly carved and painted sarcophagi of terra-cotta and marble until the Roman conquest. The numerous frescoes and sculptures in these chambers and their varied furniture give the only information available regarding Etruscan burial customs. They show clearly various stages after death: the closing of the eyes; the arraying; the exposition of the body on a couch at the entrance of the house; the official act of mourning to the accompaniment of music; the funeral procession, often of a triumphal character, with musicians, quadriga, friends, and mourners; the deposit of the body on a stone bench in the tomb or on a funeral bed or in a sarcophagus; the funeral banquet, which was so favorite an observance with the Etruscans, accompanied by music, dancing, and games, including races, wrestling, plays and shows, and even gladiatorial contests.

ROME. The Romans carried burial ceremonial to a pitch of intricacy and splendor surpassing all nations except, perhaps, the Egyptians. While they at first practiced inhumation, the practice of cremation became supreme in the Second Century B.C., lasting until it was largely superseded again by inhumation under the Antonines (Second Century A.D.). The burial rites varied according as the funeral was public or private, plebeian, patrician, or military. In important cases all citizens were invited to take part by the public crier; but ordinarily only the parents and friends. In the interval between the death and the funeral the usual ceremonies take place: closing of the eyes by the children or other relatives; the calling aloud on the defunct; the washing, anointing, and robing of the body in white, and the placing of a crown on the head, and sometimes of a coin in the mouth. Partial or complete embalming was practiced. The body remained from three to seven days on a state couch in the vestibule of the house, surrounded with flowers and burning perfumes. The funeral procession took place at night by torchlight; but under the Empire daylight funerals became the rule except for children and the poor. The body was actually carried on its litter by pallbearers—the nearest relatives—but a figure of the deceased was often drawn in a chariot. Extravagant demonstrations of grief were produced by hired mourners, and there was a band of musicians, mainly trumpeters and flute-

players, to whom, on special occasions, singers, buffoons, and actors were added. The growing unwillingness of parents and friends to walk in the funeral procession—in imperial times—is shown by testamentary inducements to do so. The proper mourning costume was prescribed. The procession went directly to the tomb, in case of inhumation, or to the funeral pyre, in case of cremation. Arms, ornaments, favorite animals, and numerous presents were thrown into the burning pyre. The tombs where many persons were buried together by the rite of cremation were called *columbaria* (q.v.). In both rites the tombs were ordinarily on the person's private property. Elaborate ritual and memorial ceremonies followed burial.

THE EARLY CHRISTIANS. Christianity abolished cremation. The belief in the resurrection of the body made inhumation preferable. Embalming was not practiced, except occasionally, though spices and unguents were used to retard decay. Several of the Roman burial customs survived in certain regions until the Middle Ages, such as the placing of a small coin (*obolus*) in the mouth and the use of charms. The use of separate tombs was abandoned in favor of cemeteries. These were either subterranean—a class popularly called catacombs (q.v.)—or above ground (*sub dio*). The catacombs could be used only where the sub-soil contained strata of rather soft, friable rock, like tufa. They consisted of narrow galleries cut in the solid rock, in which the side walls were honeycombed with rows of narrow niches just long enough and deep enough to receive the body or bodies, the opening being then closed with a slab on which the name of the deceased was usually inscribed. The more distinguished persons were buried in chambers opening out of these passages in marble sarcophagi, often carved, or in table tombs under arched tops. With the close of the era of persecution in the Fourth Century, these subterranean cemeteries were discontinued, and as all the burial ceremonies were in the hands of the clergy, it became natural to attach the cemeteries, wherever possible, to the churches, especially to suburban churches. Often there were built parallel brick walls with rows of shelves for the bodies. There were no sepulchral chambers, but the bodies were laid in regular rows of trenches, sometimes merely excavated, sometimes constructed of brick or stone work, while at other times the trenches contained plain sarcophagi of different materials. This custom has continued with but one important variation, the introduction during the Middle Ages of the custom of burying within the church itself, and in the cloisters attached to it. This led to the use of magnificent sepulchral monuments, which became an important part of church ornament. Each monastery also buried its members in a cemetery attached to its church. Often the space under the pavement of churches was honeycombed with tombs, frequently marked by sepulchral slabs. Certain churches, such as Westminster Abbey and Saint Denis, became national funerary Halls of Fame. There were also, from an early date, special sepulchral chapels and oratories for saints, martyrs, and other personages.

The northern nations, such as the Goths, preserved after their conversion some of their old funeral customs, such as the burial of arms, jewelry, and other objects of value in great

numbers with the deceased. As a rule, however, the ancient custom of burying articles of value in the tomb gradually ceased during the poverty of the early Middle Ages, and was never revived. The ceremonial connected with Christian burial is a regular part of the liturgy of the different branches and denominations, and took definite form at an early date. (See *LITURGY*.) While at first the dead were buried at the cost of the Church, after the Fourth Century this was done only for the poor. The eyes and mouth were closed by the nearest relative, the body washed and anointed—a custom which became obsolete after the Tenth Century. The ointments used were for partial preservation of the body. The body was then closely swathed in white linen and bound. Very soon the custom was introduced, especially in the case of the clergy and the nobility, of burying in the richest vestments, and the finest examples of early stuffs have been found in tombs. After the exposure of the body in the house—usually in an upper or inner chamber—the bishop, with his clergy, visited the house, recited prayers, and sprinkled it with holy water; and the ceremony included a eulogium of the deceased, which was often pronounced in the church. Most of these early customs have survived.

For further information as to burial rites, see the paragraph on ceremonies, under the title *MAN*. See also *CEMETERY LAWS*; *CORPSE*.

BURIATS, *būr'e-its'* (in Russ. *buryats*, from their ancestor *Bargubator*, or, according to another legend, *Buryaday*). A Mongol people numbering some 250,000, inhabiting the region about Lake Baikal (particularly the Irkutsk country), in southern Siberia. In their less marked Mongolian physical characteristics, their tendency to become farmers, and the preservation by a considerable portion of the primitive Shamanism of the original stock, the Buriats differ from their kindred, the eastern and western Mongols. In some branches of industry (metal-work, etc.) they show much skill, and certain members have even acquired some scientific education. Before Russian contact the Buriats were subject more or less to Chinese influence and intermixture with other Siberian peoples. The best account of these people is that of Dr. N. Melnikoff in the *Internationales Archiv für Ethnographie* for 1899, where the good and bad

effects of Russian influence and the present condition of the Buriats are discussed at length. The Buriats are increasing in numbers, and assimilation with the Russian population of Siberia, not extinction, seems to be their destiny. See MONGOLS.

BURIDAN, bu'rê'dân', JEAN (c.1300-c.58). A French scholastic metaphysician of the nominalistic party. He was born at Béthune, in Artois, studied in Paris under Occam, and was rector of the university there in 1327. Little is known of his life. It is related, but also disputed, that Buridan was driven from France, fled to Austria, and there gave the impetus to the founding of the University of Vienna. He took no part in theological discussions. His name is popularly connected with the *pons asinorum* (in logic, not in geometry) and with the ass between two haystacks. The former was a name given to any abominably obtained syllogistic middle term, which acts as a bridge to connect major and minor terms. (See LOGIC.) Such a term was called 'an ass's bridge,' because, according to Aristotle, in a clear reasoner's thought this middle term is spontaneously suggested. The other ass, carefully placed between two equally alluring bundles of hay (called 'Buridan's ass'), established the doctrine of *Determinism* (q.v.). Neither the ass nor his bridge appears in Buridan's extant writings, and they are probably the inventions, the former of a hostile caricaturist, the latter of some friendly wit. His chief works are *Summa de Dialectica* (1487); *Compendium logicae* (1489); *In Aristotelis Metaphysica* (1518); and *Questiones in Decem Libros Ethicorum Aristotelis* (1489). Consult Prantl, *Geschichte der Logik*, Vol. IV. (Leipzig, 1855-70). See NOMINALISM.

BURIN. A port of entry, capital of a district of the same name, Newfoundland, on Placentia Bay, 190 miles south of Saint John's. Map: Newfoundland, E 5). It has a well-protected harbor, important fisheries, and carries on considerable trade with Saint Pierre. Population, 3000.

BURIN (Fr., probably from OHG. *bora*, Engl. *ore*, gimlet), or GRAVER. The principal instrument used in copper-engraving. It is made of tempered steel, and is of prismatic form, the raving end being ground off obliquely to a sharp point. The style of a master is frequently described by the expressions *soft burin*, *graphic burin*, *brilliant burin*, or whatever other character may belong to it. See ENGRAVING.

BURITI (bu'ri-tê') **PALM** (Portug., from native Brazilian). A beautiful palm which grows in great abundance in the swamps of some parts of the north of Brazil. It is *Mauritia unijera*, one of several species of the genus *Mauritia*, and is one of the loftiest of palms. Its leaves are fan-shaped, and form a large globular head at the top of the stem. It produces a great number of nuts about the size of a small hen's egg, covered with rhomboidal scales arranged in spiral manner. Between these scales and the lustrous substances of the nut there is an oily, reddish pulp, which is boiled with sugar and made into a sweetmeat. An emulsion is also prepared from it, which, when sweetened with sugar, is a very palatable beverage. The juice of the stem also makes a very agreeable drink. To obtain it, the tree is usually cut down, when

several holes about 6 inches square, 3 inches deep, and 6 feet apart, are cut in the trunk with a small axe; and these in a short time are filled with a reddish-colored liquid, having much the flavor of sweet wine. There are six or seven species of *Mauritia*, all of them American.

BURKE, EDMUND (1729-97). An English statesman and orator. He was born in Dublin, where his father had an extensive practice as an attorney. As a schoolboy he displayed those traits of character and the germs of those powers which ultimately gave him greatness. His preparatory training was gained at a school in Ballitore, County Kildare, kept by Abraham Shackleton, a member of the Society of Friends. To this man, whom he always held in affectionate esteem, he believed he owed the best part of his education. In 1743 Burke entered Trinity College, Dublin, where he seems mainly to have devoted himself to his favorite studies of poetry, oratory, history, and metaphysics. He made himself acquainted with Latin writers, particularly with Cicero, whom he accepted as a model 'in eloquence, in policy, in ethics, and philosophy.' In February, 1748, he graduated B.A., and in 1751 took his degree as master of arts. In the interval (1750), being destined for the English bar, he proceeded to London, to keep his terms at the Middle Temple, where he had been entered in 1748. To legal studies, however, he never took kindly, and ultimately he abandoned the idea of becoming a barrister. During the years 1750-56 he would appear to have occupied himself mainly in traveling through England and on the Continent, enjoying the society of literary men.

When yet at the university Burke had achieved a local reputation for literary talent and eloquence. Among the compositions of his undergraduate life the most noticeable perhaps is his translation of the conclusion of the Second Georgic of Vergil, which shows poetic talent of no mean order. His first important publication, however, was the celebrated *Vindication of Natural Society*, written in imitation and ridicule of the style and reasoning of Lord Bolingbroke, in which, with well-concealed irony, he endeavored to confute his lordship's views of society by a *reductio ad absurdum*. This work, published anonymously in 1756, attracted considerable attention. Soon after, in the same year, appeared his well-known essay, *The Philosophical Inquiry Into the Origin of Our Ideas on the Sublime and Beautiful*—a work which gained the praise of Johnson and Lessing.

The essay on the Sublime and Beautiful, although of little real value, attained a rapid popularity, and its author soon found himself courted by all the eminent men of his time. Garrick was already one of his friends; among them he soon could count Reynolds, Soame Jenyns, Lord Lyttelton, Goldsmith, Hume, and Dr. Johnson. Notwithstanding this popularity, his progress continued slow; for three years he had to occupy himself with periodical writing, devoting his leisure principally to political subjects. What is considered a joint work of Burke and his cousin, William Bourke, appeared in 1757—*An Account of the European Settlements in America*—and shows how carefully at this date he had studied the condition of the Colonies. During the next year he began his writing for the *Annual Register*, the first volume of which appeared in 1759. In 1761 Mr. W. G. Hamilton ('Single-speech'

Hamilton), then Secretary for Ireland, having appointed him his private secretary, he returned to Dublin, where, during two years' service, he demonstrated his aptitude for political business, receiving in 1763, in reward for his services, a pension on the Irish establishment of £300, which, however, he did not long enjoy.

Returning to London in 1764, he became a member of the literary club which met at the Turk's Head in Gerard Street, and whose history is associated with almost every considerable name in the literature of the period. But literary society did not call off his attention from the chances of a political career. He became private secretary to the Marquis of Rockingham, on his becoming Premier (1765), and entered Parliament as a member for Wendover (1766). Here his eloquence at once gave him the reputation of being 'the first man in the Commons.' The Rockingham Administration, however, lived only a few months, and with it terminated this, his second political employment. He was successively member for Wendover, Bristol, and Malton; his Parliamentary life extended without intermission to 1794. Twice he held the post of paymaster of the forces, once under Rockingham, and again under Lord North, with the standing of a privy councillor. After a career in Parliament remarkable for the laboriousness, earnestness, and brilliancy with which every duty was discharged, and extending over nearly thirty years, he retired at last, receiving the thanks of the Commons for his numerous public services, and rewarded by the Government, on the express request of his sovereign, with pensions amounting in all to several thousand pounds. He administered the office of paymaster of the forces with scrupulous regard to public economy, and sacrificed all the perquisites of his office, exhibiting a severe integrity then unusual among public men. In his relations with the constituency of Bristol, which was alienated from him by his advocacy of the claims of the Roman Catholics and of the opening up of the trade of Ireland, he was the first to maintain the doctrine of the independence of Parliamentary representatives—that they are not machines to vote for measures approved by their constituencies simply for that reason, but men and thinkers chosen by them calmly to consider and legislate for the good of the Commonwealth. During his career he rendered more important service to the cause of humanity than any other man of his time in Europe: he prepared the way for the abolition of the slave-trade, a measure which was destined to ripen to success in the hands of Wilberforce; he advocated the cause of humanity in India against the voracious greed of stockholders, who regarded its millions simply as materials for plunder, and largely contributed to improve the government of that country. Toward America he advocated a policy of justice and conciliation, which had it been adopted would have averted the horrors of the War of Independence, and retained the Colonies in amity with the mother country. To the advocacy of every cause which he espoused he brought a capacity for patient research that was unlimited, and an eloquence that has seldom been equalled.

Burke produced a vast number of writings on many subjects. Among the more important are: *Observations on a Pamphlet on the Present State of the Nation* (1769), replying to a paper variously ascribed to Fox or Grenville; *On the Cause*

of the Present Discontents (1770); the celebrated speech in 1788 opening the trial of Warren Hastings (q.v.), and the equally famous speeches on *American Taxation* (1774) and on *Conciliation with America* (1775), which may perhaps be regarded as the most splendid monuments of his eloquence and statesmanship. On the other hand, with strange inconsistency, Burke resisted the movement for the reform of Parliamentary representation; and he failed utterly to grasp the true meaning of the French Revolution. In 1790 appeared his *Reflections on the Revolution in France*, which had a remarkable success. Eleven editions were issued within the first year, and by 1797 more than 30,000 copies had been sold. It was received with delight by George III., and by every enemy of the Revolution; yet, as a contribution to the literature of social history, the book is worthless. Burke was an ardent lover of order; and, deceived by the violence of the Jacobins, the man who had stood so bravely for the rights of the English colonists and the Hindus, was unable to perceive that the French people were struggling to free themselves from a class-despotism far more oppressive. In his *Rights of Man*, Thomas Paine made a trenchant reply to Burke's book; and it was also answered by Mackintosh in *Vindiciæ Gallicæ*.

Few men have been the subjects of higher panegyric than Burke, and, on the whole, few have better deserved praise. He was noble-minded, pure in his life, and a purist in politics. Intellectually, he was most richly endowed. Possessing imagination, rare powers of observation, and indefatigable industry, there was no subject which he could not master, and none which, having mastered, he could not expound with unparalleled richness of language. But with these virtues and powers were conjoined defects, which, without bating their greatness, largely neutralized their influence. He was, it may be said, too literary to be a philosopher, and too philosophic to be a politician. His career would seem to illustrate this position. His oratory astounded by its brilliancy rather than persuaded by its tone and argument; and in the long run the eloquence which failed to command the reason ceased to captivate the ear. The man who at first evoked the enthusiasm of the House by the brilliancy and power of his eloquence, did actually at last empty it by persistence in the monotonous splendors of his speeches. Passionate and in a great degree intractable, he was unsuited for party politics, and drifted from all his connections, breaking up slowly all party ties, and even the ties of friendship, till he reached at last almost a state of political isolation. At the same time, it must not be forgotten how great an influence he, half philosopher, half politician, exercised on the counsels of the State; many of his views on politics and public economy were anticipations of science, as many of his previsions of the course of events were prophecies. He died on July 7, 1797.

There is an excellent edition of Burke's Works in 12 volumes (Boston, 1871); reprinted in 6 volumes in the Bohn series (London, 1880). His *Letters*, in 4 volumes, were edited by Earl Fitzwilliam and Sir R. Bourke (London, 1844); and they are reprinted in the edition of the Works (London, 1852). Consult: A. J. George, editor, *Speeches on the American War*, and *Letter to the Sheriffs of Bristol* (Boston, 1891); James

Prior, *Life* (5th ed., London, 1854); Croly, *Memir of the Political Life of Burke* (Edinburgh, 1840); Macknight, *History of the Life and Time of Burke* (3 vols., London, 1858); Morley, "Burke," in the *Men of Letters Series* (New York, 1879), and *Historical Study* (New York, 1867); and Hunt, in *Dictionary of National Biography*, VII. (New York, 1891).

BURKE, JOHN (1787-1848). An Irish genealogist. He began literary work in London, but later made a study of genealogy, and in 1826 began the publication of the *Genealogical and Heraldic Dictionary of the Peerages of England, Ireland, and the United Kingdom* (9th ed., 1847), the first compilation of the sort to include both baronets and peers in alphabetical order. Chief among his other publications are: *A General and Heraldic Dictionary of the Peerages of England, Ireland, and Scotland—Extinct, Dormant, and in Reversion* (1831; 3d ed., 1846); and *A Genealogical and Heraldic History of the Commoners of Great Britain and Ireland* (4 vols., 1833-38), later editions of which appeared under the title, *A Dictionary of the Landed Gentry* (1855-57).

BURKE, Sir JOHN BERNARD (1814-92). An Irish genealogist, son of the preceding. He was born in London, was educated at Caen College (Normandy), studied law at the Middle Temple, was admitted to the bar in 1839, and in 1853 became Ulster king-at-arms. In 1855 he was appointed keeper of the State papers in Ireland. In this capacity, in 1866, he visited France for the purpose of studying the record system in use there. From 1847 until his death he edited the annual *Genealogical and Heraldic Dictionary of the Peerage and Baronetage of the United Kingdom*. At various times he was also editor of other works of a similar character. Among his original publications are *The Romance of the Aristocracy* (1855) and *The Book of Precedence* (1881).

BURKE, MAURICE FRANCIS (1845—). An American prelate, born in Ireland. He was educated at Saint Mary's University, Chicago, Ill., and the American College, Rome, Italy, and was ordained priest of the Roman Catholic Church in 1875. Pastor of Saint Mary's Church, Joliet, Ill., from 1878 to 1887, he was in the latter year consecrated Bishop of Cheyenne, Wyo. In 1893 he was transferred to the see of Saint Joseph, Mo. He is an accomplished linguist.

BURKE, ROBERT O'HARA (1820-61). An Irish explorer, born at Saint Cleram (County Galway). He was educated in Belgium, and afterwards enlisted in the Austrian Army, in which he rose to be captain. In 1848 he became a member of the Irish constabulary. In 1853 he emigrated to Australia, where he was appointed inspector of police in Victoria. He received in 1860 the command of an expedition sent out to cross the continent from south to north. With N. J. Wills he reached the tidal waters of the Flinders River, being thus one of the first white men to traverse Australia. On the return journey both he and Wills died of starvation near Cooper's Creek. Their bodies, recovered in 1862, were given a public burial early in 1863, and memorial statues were erected in Melbourne. Consult Howitt, *History of Discovery in Australia*, Vol. II. (London, 1865).

BURKE, THOMAS MARTIN ALOYSIUS (1840—). A Roman Catholic prelate. He was born

in Ireland, January 10, 1840; educated at the College of Saint Michael, Toronto, and at Saint Charles College, Maryland; graduated from Saint Mary's Seminary, Baltimore, was ordained to the Roman Catholic priesthood and assigned to duty at Albany, N. Y., 1864; became Vicar-General of the diocese in 1887; and was consecrated the fourth Bishop of Albany in 1894.

BURKE, THOMAS NICHOLAS (1830-83). A Roman Catholic orator known as 'Father Tom.' He was born in Galway, Ireland; studied theology in Rome and Perugia; joined the Order of Saint Dominic, and after remaining five years in Italy was sent by his superiors to England. He soon established a reputation as an orator; preached in Ireland, England, and Italy; and in 1872 visited the United States, where his course of lectures in answer to Froude gained much attention. His lectures were reprinted under the title of *English Misrule in Ireland* (1873). Consult: his *Life* by W. J. FitzPatrick (London, 1885) and *The Inner Life of Father Thomas Burke* (London, 1894).

BÜRKEL, bür'kel, HEINRICH (1802-69). A German painter, born at Pirmasens, Bavaria. He studied at the Munich Academy and in Italy, and painted chiefly genre pictures in a style which is truthful and sometimes humorous. His pictures include "Scenes in an Inn;" "Fêtes in the Alps;" and "Winter Scene in the Tyrol."

BURKING. A colloquial term in England for murder committed for the purpose of selling the victim's body for dissection. It came into use after the conviction, for an atrocious crime of this character, of William Burke, executed in Edinburgh, January 28, 1829.

BURKLEIN, böörk'lín, FRIEDRICH (1813-72). A German architect, born at Burk, in Franconia. He studied at the Munich Academy as a pupil of Gärtner—whom he assisted in the construction of the royal palace in Athens—and was active in the architectural development of Munich under King Maximilian II. He designed the Maximilianstrasse, and built the Maximilianeum. As *Generalbaudirektor*, he had charge of many public works. His style combined the Renaissance and the Romanesque types.

BURLEIGH, bër'li, LORD. See CECIL, WILLIAM.

BURLEIGH, LORD. A character in the parody on heroic tragedy which Sheridan introduces into *The Critic*. According to Mr. Puff, his creator, he can express volumes with his nod alone.

BURLESQUE. A dramatic or literary composition tending to excite laughter by an exaggerated travesty of some more serious work, or by a ludicrous contrast between the subject and the manner of treating it. A burlesque is distinct from a parody or satire, being of a broader, more pronounced type, and differs from a farce in being even more extravagant in its construction.

The burlesque in literature was first used as a distinct style by Berni, an Italian poet, who, early in the Fourteenth Century, published a volume of *Burlesque Rhymes*. The success of this book brought forth a host of imitators, among whom were Mauro and Caporali, and introduced the burlesque into France, where Sarrazin, and, later, Scarron, carried the new form to a high degree of excellence. *L'Enéide travestie* was the

beginning of a long line of travesties in which Scarron burlesqued Paris, Amsterdam, society, etc., and by which he established firmly his reputation as the greatest French writer of burlesque. In England burlesque developed early, along a somewhat irregular line. Chaucer, for instance, in his *Rime of Sir Thopas*, ridicules the long, dreary tales of the Middle Ages; Beaumont and Fletcher's *Knight of the Burning Pestle* is a travesty on ultra-chivalric romances; Butler's *Hudibras* contains burlesque motives; and still later *The Rejected Addresses* of the Brothers Smith brought the English form of burlesque to a high level. In Spain Cervantes, with his immortal *Don Quixote*, created a new type of burlesque, which was imitated in the next century by Le Sage in France with his diverting history of *Gil Blas*. During the later history of literature there have been innumerable travesties, parodies, and burlesques of contemporary poems and authors, but, with the possible exception of those by Thomas Hood, none of them are of importance.

The dramatic burlesque has varied greatly in its form. Aristophanes uses it in his comedies; Euripides and Plautus contain germs of it; the Italian dramatist Gozzi employs it most successfully in his tragi-comedies; and under Molière burlesque *per se* reaches its highest dramatic excellence. The most noted of English burlesques on the stage are those of Planché, brought out in London in the years following 1818; and a rich vein of travesty runs through many of the plays of W. S. Gilbert (q.v.). But in modern times burlesque has degenerated from comedy to farce, and from farce to a musical medley of travesty and vaudeville. Indeed, in France the 'vaudeville' corresponds to the English burlesque. Consult: Flögel, *Geschichte des Burlesken* (Leipzig, 1793); Morillot, *Scarron et le genre burlesque* (1888); *Burlesque Plays and Poems*, in Morley's *Universal Library*.

BURLINGAME, ANSON (1820-70). An American politician and diplomatist. He was born at New Berlin, N. Y., but removed with his father to Ohio in 1823 and to Michigan ten years later. He graduated at the University of Michigan in 1841, and at the Harvard Law School in 1846, and subsequently practiced law in Boston. In 1852 he became a member of the State Senate, and in the following year was sent to the State Constitutional Convention. He was an enthusiastic worker in the Free-Soil Party, especially in the Presidential campaign of 1848; and in 1854 joined the American Party, and became one of its representatives in the Thirty-fourth Congress. His denunciation of Brooks's assault upon Senator Sumner provoked a challenge from Brooks, which he at once accepted, naming rifles as the weapons. Brooks did not fight. Burlingame was a Congressman until 1861, and in that year was sent as Minister to Austria, where the feeling against him, because he had favored Hungarian independence, led to a positive refusal to receive him as a diplomatic representative. He was then sent to China, where he remained as Minister until 1867, when, having completely gained the confidence of the Chinese Government, he was appointed special Chinese envoy to the United States and various European Powers. In 1868 he negotiated with the United States Government the "Burlingame Treaty," notable as marking the first acceptance by China of the principles of international law, and as granting important re-

ciprocal privileges to the two Powers. Subsequently he negotiated important treaties with Denmark, Sweden, Holland, and Prussia, and in 1870 he died in Saint Petersburg while arranging the terms of a treaty with Russia.

BURLINGAME, EDWARD LIVERMORE (1848—). An American magazine editor, born in Boston, Mass. He was educated at Harvard and Heidelberg, and became editorially connected with the *New York Tribune* in 1871. From 1872 to 1876 he was a member of the staff for the revision of Dana and Ripley's *American Cyclopædia*, and in 1879 joined the editorial force of Charles Scribner's Sons. In 1886 he became editor-in-chief of *Scribner's Magazine*.

BURLINGTON. See BRIDDLINGTON.

BURLINGTON. A city, railroad centre, and county-seat of Des Moines County, Iowa, 266 miles west-southwest of Chicago, Ill., on the right bank of the Mississippi River, and on the Chicago, Burlington and Quincy and several other railroads (Map: Iowa, F 4). Burlington, sometimes called the 'Orchard City,' occupies a natural amphitheatre, formed by the limestone bluffs that slope back from the river, and on which many of the residences are built, and is regularly laid out. The river here is broad and deep, and is spanned by the railroad bridge of the Chicago, Burlington and Quincy Railroad. Burlington is connected by steamboat lines with important points on the Mississippi, and its river commerce is important. The industries are the manufacture of machinery, wagons, wheels, desks, furniture, lumber, agricultural implements, screens, mattresses, brooms, soap, flour, linseed oil, etc.; pork-packing and the quarrying of limestone found in the vicinity. The extensive machine and repair shops of the Chicago, Burlington and Quincy Railroad are located here. Among the prominent buildings are the opera house, Young Men's Christian Association building, court-house, city hall, and hospitals. The city has a public library of over 17,000 volumes, Burlington Institute College, beside high schools and grammar schools. Crapo Park of 100 acres, situated in the southern part of the city, has a fine location and scenery not excelled along the Mississippi. The city is governed by a mayor, elected for two years, and a city council, which has the power of appointment to most of the city's offices. Burlington was named from the city of Burlington, Vt., by its first settlers. A fur-trading post was established here as early as 1829; the first dwelling-houses were erected in 1833, a town was laid out in 1834 and incorporated in 1837, and the city chartered in 1838. It was the capital of Iowa from 1837 to 1840. Population, in 1890, 23,201.

BURLINGTON. A city and county-seat of Coffey County, Kan., 60 miles south of Topeka on the Neosho River, and on the Atchison, Topeka and Santa Fe, and the Missouri, Kansas and Texas railroads (Map: Kansas, G 3). It is the centre of an agricultural and stock-raising district, in the principal products of which it has considerable trade, is supplied with good water-power, and contains flour-mills. The city has a public library. Population, in 1890, 2,239; in 1900, 2,418.

BURLINGTON. A city and port of entry in Burlington County, N. J., on the Delaware

River, 18 miles above Philadelphia, and on the Pennsylvania Railroad (Map: New Jersey, O 3). Burlington has a public library, and is the seat of Burlington College, founded in 1846, and Saint Mary's Hall for girls (Protestant Episcopal). There are manufactures of shoes, stoves, iron pipe, carriages and harness, and canned goods. Burlington is governed under a charter of 1851 (revised 1868), which provides for a mayor, elected every three years, and a municipal council. The city owns and operates its water-works. Population, in 1890, 7264; in 1900, 7392.

Burlington was settled in 1677 by London and Yorkshire Friends, and before receiving its present name, was called first New Beverly, and then Bridlington. After 1686, until Trenton was made the capital of New Jersey, the Legislature met alternately at Perth Amboy and Burlington. A city charter, granted by Governor Cosby in 1733, was confirmed by the Legislature in 1744, and in 1784 a new charter was issued. The city was fired upon by the English and Hessians in 1776, and again in 1778, when much property was destroyed, though no lives were lost. Consult Woodward, *History of Burlington and Mercer Counties* (Philadelphia, 1883).

BURLINGTON. A city, port of entry, and county-seat of Chittenden County, Vt., 40 miles west by north of Montpelier, on the eastern shore of Lake Champlain, and on the Rutland and Central Vermont railroads (Map: Vermont, A 4). Burlington has a beautiful situation on high ground, and is laid out in broad, well-shaded streets. In the centre of the city is a large public square, near which are the handsome court-house, the city hall, the United States post-office and custom-house, and the Young Men's Christian Association building and the site of the new public library. The University of Vermont and State Agricultural College (q.v.), founded in 1791, is finely located on a hill; the Billings Library, designed by H. H. Richardson, is the most notable of its buildings. Among other features of the city are the Fletcher Free Library, the Howard Opera House, the Masonic Temple, the Roman Catholic cathedral, Saint Paul's Episcopal Church, the Mary Fletcher Hospital, Home for Destitute Children, Louisa Howard Mission, Providence Asylum, Saint Patrick's Academy, Saint Mary's Academy, Bishop Hopkins Hall, Edmunds High School, Vermont Episcopal Institute, Battery and College parks, the latter containing a statue of Lafayette, and two cemeteries—Lake View, situated near the lake, and Green Mount, overlooking the Winooski Valley, and containing the grave of Col. Ethan Allen, with a monument. An artificial breakwater forms a safe harbor, connected by steam and sailing vessels with leading ports on the lake. Burlington is one of the largest lumber markets in the country, the product being brought principally from Canada; and extensive quarries of marble, limestone, and other building-stone in the vicinity furnish material for another branch of its commerce. There are also important manufactures, to some extent promoted by the water-power furnished by the Winooski River, which include lumber, furniture, chairs, refrigerators, packing-boxes, brushes, patent medicines, cotton and woolen goods, paper, etc. Under a revised charter of

1896, the government is vested in a mayor, annually elected; a city council, of which the executive is a member; and administrative officials, the majority elected by the council. The water-works are owned and operated by the municipality. Population, in 1880, 11,365; in 1890, 14,590; in 1900, 18,640.

Burlington was chartered in 1763, but no settlement was made until about 1774, and it was not regularly organized as a town until 1797. In 1809 the *Vermont*, one of the first steam-boats to be built in the country, was launched here. Burlington was chartered as a city in 1865.

See Vol. I. of *Vermont Historical Gazetteer* (4 vols., Burlington, 1867-82), and a sketch in the *New England Magazine* (Vol. XI. second series).

BURLINGTON ARCADE, THE. A paved and roofed passage, raised a few steps above the street, running between Piccadilly and Burlington Gardens, London. On each side are small, open-fronted shops, where minor wares of all sorts can be purchased.

BURLINGTON HOUSE. An old mansion in Piccadilly, London, between Old Bond and Sackville streets, built for Richard, Lord Burlington, in 1695-1743. It was a meeting-place of Eighteenth-Century notables, and is still a literary and scientific centre. It was purchased by the British Government in 1854. On part of the old garden stands the new Burlington House, finished in 1872, the home of the Royal, Geological, and Antiquarian Societies, and other learned bodies.

BURLINGTON LIMESTONE. A limestone of Carboniferous age, and a valuable material for building, found in abundance near Burlington, Iowa, and elsewhere in the Mississippi Valley. It is divisible into two members, the upper one being nearly pure carbonate of lime, the lower one containing magnesia. This formation is peculiar for the abundance of fossils found in it, especially of crinoidea and corals.

BURLOS, *būr'lōs* (from the cape *Brullus*). A lagoon in the Nile delta, Egypt, beginning about 5 miles east of Rosetta. It extends eastward for about 38 miles, and is separated by a narrow strip of land from the Mediterranean, with which it communicates through a narrow channel (Map: Egypt, D 1).

BURMA (corrupted from *Mrumurā*, *Myomma*, *Barma*, *Bamu*, probably connected with the introduction of Brahmanism). The largest and easternmost province of British India. It is included within the parallels of 10° and 28° N., and the meridians 92° and 101° E., and extends from the southern border of Tibet far down into the Malay peninsula, with a total length of 1250 miles. The eastern boundary of Burma follows a meridian approximately throughout the whole extent from north to south. The east and west extent, however, varies extremely, the country beginning at the south as a strip of territory 30 or 40 miles wide, and broadening toward the west, at about latitude 16° or 17° N., to a width of 200 miles. Above latitude 20° it again broadens slightly toward both east and west, reaching its greatest width of about 550 miles in latitude 21° N. North of

latitude 24° the breadth rapidly decreases to about 125 miles on the northern border. Burma has an area, exclusive of dependent native States, of 168,550 square miles, and is divided for administrative purposes into Upper and Lower Burma. Lower Burma occupies the narrow strip of coast south of about latitude 22°, and Upper Burma occupies the remainder of the country extending inland as far south as latitude 18° 30'. Lower Burma comprises the former Kingdom of Arakan (q.v.) in the north and Tenasserim (q.v.) in the south (both acquired by the British at the close of the first Burmese War in 1826), and between these two the territory of the old Kingdom of Pegu (q.v.), acquired by the British at the close of the second Burmese War in 1852. Upper Burma corresponds to the Kingdom of Burma as it existed at the time of the British conquest in 1885. Burma is bounded on the north by Assam and Tibet; on the east by China, French Indo-China, and Siam; on the south by the Bay of Bengal; and on the west by the Bay of Bengal, Bengal, and Assam. It extends from the lower waters of the Bay of Bengal on the south to the eastern end of the Himalayan Mountains on the north. It is traversed by a series of mountain ranges lying nearly north and south, while in the intervening valleys flow the waters of the two great rivers, the Irrawaddy and the Salwin, with many large branches, and also several smaller rivers reaching the coast. Thus the surface consists of many mountain ranges alternating closely with valleys, most of which are narrow, the valley of the Irrawaddy being by far the broadest and most important economically.

The mountains on the northern boundary, separating Burma from Tibet, reach a height of 15,000 feet. The ranges which traverse the country in general diminish in height southward, ranging from 8000 to 10,000 feet in the north to 6000 to 8000 feet in the latitude of Mandalay, and to 4000 to 6000 feet between the parallels of 18° and 20°. The Irrawaddy and Salwin rivers rise in Tibet and are large streams at their entrance into Burma. The upper part of the valley of the Irrawaddy is narrow, as are the valleys of its upper tributaries. Indeed, above Bhamo, at the mouth of the Taping, the main river flows in a mountain gorge, and immediately below this point, in cutting through a mountain range, it flows in a narrow cañon. A few miles above Mandalay it enters a broad plain, through which it passes; a hundred miles below Mandalay it is joined by the Chindwin, its largest branch. Its delta is very extensive, being nearly 200 miles in length, with an area of 18,000 square miles. These delta lands are extremely fertile, are densely populated, and are highly cultivated. The mean discharge of the river at its mouth is estimated at 480,000 cubic feet per second, or about the same as that of the Ganges. It is subject to great floods in the rainy season, the flow at this time being often eighteen times as great as at low water. It is navigable for large river steamers as far as Mandalay, and for smaller craft some distance above Bhamo.

The Salwin is second only to the Irrawaddy in volume. This river throughout its course in Burma flows in a narrow valley, hemmed in by mountains, and affording little level land for cultivation. It is navigable for only a short distance, owing to frequent rapids. The Sittang heads

south of Mandalay, and flows in a broad valley between the Irrawaddy and the Salwin. There are hundreds of minor streams in this well-watered country, but as they partake of the nature of mountain torrents, or are fed by them, they are useless for navigation, at least during the dry season. After the rainy season has begun the larger rivers are crowded with the native boats, for the waterways are the highways of the country. Even before the rain sets in the great rivers begin to swell, owing to the melting of the Himalaya snows. Toward the beginning of July the rivers and their tributaries usually rise ten to twenty feet, submerging their banks and flooding the low lands. In many places, where in dry weather a cart-track is found, there is, during the wet season, a creek navigable by heavily laden boats. The whole aspect of the country and the mode of life are thus changed with the alternations from dry to wet seasons. The villages of the delta are accessible by water, and it is at this season that the heavy traffic of the country is carried on. At Mandalay, where the Irrawaddy is about 2 miles wide, the water rises 30 feet, and in the Salwin there is a rise of 50 feet. These high-water levels are maintained with some fluctuations till September.

CLIMATE. The climate of Burma ranges from that of the eastern Himalayas on the north to that of the tropical oceanic regions on the south, most of the country being in the torrid zone. The monsoons have a powerful effect upon the climate; in winter they blow from the north and northeast off the land, and produce the dry season, and in summer they blow from the south and southwest off the sea, causing a heavy rainfall on the coast, and, moving up the river valleys, they carry a heavy precipitation far inland. The rainfall on the coast ranges from 120 to 160 inches, and is much greater than this in some special localities. In the interior it is distributed irregularly, being affected by the local topography, but it is almost everywhere ample in amount, and in many places excessive, ranging from 40 to 160 inches. The temperature changes with the latitude and altitude and proximity to the sea, and with the direction of the monsoons. The coast temperatures are very constant, ranging from 80° to 90°. In the interior the contrast is greater, the temperature ranging from 50° or 60° in winter to 80° or 90° in summer, while at considerable altitudes, in the north, the country is subject to frosts in the cold season. The great fertility of the soil in Burma is further increased in the lowlands by the fertilizing overflows of the rivers.

FLORA. All the land not under cultivation is clothed with dense tropical forests, containing many fine dye and cabinet woods; and in the northern part of the country there is a great deal of teak, one of the most important exports. This wood has a peculiar odor, due to the presence of an oil which repels insects and protects it from decay. The oil-tree, yielding gallons of oil every season, is found at the headwaters of the Salwin. Ironwood, which grows in among the bamboo, is abundant and widely utilized. Below the upper forests are the sandstone and laterite, on which the forests are open and stunted. Other trees are the palm, cocoanut, betel, and palmyra. Breaking the ever-green monotony of the riverside is the nipa-palm, with immense fronds somewhat like the cocoanut. The

COPYRIGHT, 1902, BY DODD, MEAD & COMPANY.

THE MATTHEWS-NORTHROP WORKS, BUFFALO, N. Y.

bamboo is universal and exceedingly useful. Planted in front of the houses are cocoanut and betel palms, giant bamboo, tamarind, mango, and jack, useful for their fruit and shade. The screw pine, castor-oil plant, crotons, begonias, caladiums, balsams, are cultivated in many places. Other fruits are limes, citrons, jujube, guava, cashew, custard-apple, orange, mangosteen, and durian, the latter being highly prized. The plantain and banana are the leading fruits of Burma; pineapples and many garden vegetables also abound.

FAUNA. Elephants, rhinoceroses, tigers, leopards, four species of deer, buffaloes, oxen, and goats, bears, tapirs, boars, wildcats, monkeys, gibbons, and crocodiles furnish game for the hunter. The Asiatic elephant attains a larger size here than elsewhere.

Burma is, in fact, the land of elephants; they are not only still plentiful in the wild state, but are used to a large extent as draught-animals. The ox, horse, and buffalo also serve the purposes of labor, and especially among these the buffalo, which is a valuable draught-animal in the muddy regions. Peacocks (the national emblem), silver pheasants, and jungle-fowl of various sorts abound, as do also many other birds that are hunted for sport and food. Rats are almost a plague in the north provinces.

MINERAL RESOURCES. Burma is believed to be very rich in mineral resources, though little beyond a rough survey has been made, and most of the gold and silver used is imported from China, India, and Europe. Some of the rivers contain gold in the sand, which is washed out by the natives. Silver, copper, lead, iron, antimony, bismuth, and tin are also mined, but not, as yet, in large quantities. Nitrates, salt, limestone, and amber, serpentine, coal in abundance, and petroleum are found. The chief mineral wealth thus far developed has come from the mines of jade, amber, ruby, and sapphires, which are discovered in the sand and gravel of Upper Burma. Mining is still in its rudimentary stages, but in recent years modern machinery has been introduced, and the amount of metal obtained from the ore, and the size of the slabs of the more valuable kinds of stone, are much larger than formerly. The finest variety of white marble found near Mandalay is much used in the Buddhist sculptures, and in the decoration of temples.

AGRICULTURE AND OTHER INDUSTRIES. Like most Indian provinces, Burma is chiefly agricultural. The prevailing system of tenure is the *rāyatwārī*, i.e. the farmer leasing his land directly from the State, and being assessed a tax in proportion to the area cultivated. The main agricultural product is rice, grown almost exclusively in the lowlands. About one-tenth of the area of the province can be utilized for the cultivation of rice. The extension of rice-culture has been very rapid, and Burma is now looked upon as a chief source for the world's supply. Out of a total area of over 9,500,000 acres under cultivation in Upper and Lower Burma in 1899-1900, over 8,000,000 acres were in rice, and the remainder in grains, oil-seeds, cotton, tobacco, sugarcane, tea, and indigo. The methods of cultivation are primitive, and elephants are not infrequently used in farming. The native religion prohibits meat-eating, consequently there is no raising of cattle for beef. Burma has few large manufacturing establishments. The weav-

ing of silk in Lower Burma and of cotton in Upper Burma is almost universal. Pottery is also produced extensively in both parts of the country. A number of industries are carried on on a small scale, often as adjuncts to agriculture. There are many skillful workers in gold, iron, and wood, and the native products have high artistic value.

COMMERCE AND TRANSPORTATION. The commerce of Burma has developed along with agriculture, and as the largest product is rice, it is also the chief article of export, usually constituting about 80 per cent. of the total exports. The foreign trade is wholly controlled by foreigners, mostly English and Chinese, while the internal trade is in the hands of the natives. Usury prevails to a great extent, the rate of interest ranging from 1 to 6 per cent. per month. The sea trade of the province (excluding Government imports and exports) steadily increased from \$75,000,000 in 1891-92 to \$101,200,000 in 1899-1900. In 1899-1900 the excess of exports over imports was Rs.6,00,00,000 (\$19,440,000). Besides rice, the exports include teak, about 9 per cent.; catechu; raw hides, 2.4 per cent.; raw cotton; india-rubber, about 2 per cent. The imports embrace cotton, wool, and silk goods, raw silk, metals and metal products, and fish. The foreign trade is with Great Britain and its colonies, and to some extent with America. The inland trade, at the end of the century, was a little over Rs.3,00,00,000 (\$9,720,000), of which about 60 per cent. was with Western China, and the rest with the Shan States and Siam. Rangoon is the chief commercial centre of the province, and receives about 80 per cent. of the total trade. The merchant marine numbers over 6200 vessels, with a total tonnage of over 4,000,000.

Under British rule new systems of roads and bridges have been introduced, three navigable canals dug, the Irrawaddy embanked and furnished with a large fleet of steamers, the chief cities fortified in modern style, and hospitals, court-houses, and churches built in many places. The chief railways extend from Rangoon to Mandalay and Myitzyina, with a branch from Meiktila to Myingyan, and one from Rangoon to Thayetmyo. From Mandalay the road extends into the region of the jade and amber mines. Another road is projected from Mandalay to Kun-lon, which is the Mandalay-Salwin line. It is on this line, between Mandalay and Kun-lon, that the famous Gokteik viaduct has been built over the gorge through which flows Chunzoune Creek. Here, 500 feet above the water, rises a remarkable natural bridge of limestone, and upon the top of this freak of nature rests the 320 feet of steel trestle-work that forms the Gokteik viaduct—2260 feet long and about as high as the towers of the new Brooklyn bridge. All the material and skilled labor in connection with that structure came from the United States. In 1896 this Burma Railway Company, with a capital of \$10,000,000, had 1000 miles open to traffic, the Government guaranteeing interest at 2½ per cent., and a participation in the surplus profits. The roadbed passes through jungles not long since occupied by elephants and tigers.

GOVERNMENT. Burma, before it came under the rule of Great Britain, was a despotic monarchy, though the King, or 'Lord of the White Elephant,' was assisted by a high council of four Ministers of State, who gave or-

ders to the governors of provinces. The Hindu Code of Manu, translated into Burmese, served as a body of laws; decrees were often issued by the King; but custom played the most important part in the legal system. The insignia of royalty were the white elephant and white umbrella. There was no hereditary nobility, but rank was conferred by office, and its various degrees were indicated by the different shades of garment, furniture, or utensils, and especially by the color of umbrellas. The lower grades of office, however, were, and still are, hereditary. This is especially true of the headmen, who levy the taxes from the people. The extortion of officials frequently drove the villagers to assassination; the common term for 'the people' was 'the poor,' and the popular category of the five enemies were Fire, Water, Robbers, Rulers, and Ill-wishers. The governors and deputies who acted as judges heard cases in an open shed in a public place, but every cause was presented in the first instance at the official's house, to which none could come empty-handed. The village elders constituted the ultimate tribunal of government, and they were consulted by the officers on all matters affecting the people. Burma is now under the Viceroy of India, and is governed by a Lieutenant-Governor, assisted by a Legislative Council at Rangoon. In each of the eight divisions is a commissioner, who is the chief judicial and executive officer. Each division is again subdivided into districts, townships, and village communities, in which Burman magistrates preside. The headmen of the village still retain local police and revenue powers, and each village has its judicial commissioner and recorder. The police force is made up of natives and Indians, under the command of European officers. There are 37 districts, about 500 magistrates under salary, and 125 native honorary magistrates. The chief revenue sources are the tax on land, amounting to about 40 per cent. of the total; the poll-tax (4 rupees per head); customs; forests; opium and salt monopolies; and the income tax. In 1899-1900 the revenues and expenditures of Burma were Rs. 7,04,36,240 (\$24,650,000) and Rs. 4,57,33,116 (\$16,006,600), respectively.

The principal towns of Burma are Mandalay, Rangoon, and Maulmain.

POPULATION. In 1901 the inhabitants of Burma, mostly native, numbered 9,221,161, the increase being over 18 per cent. since 1891. The original Burman tribes are believed to have descended southward from Tibet. The tribe of Bama, or Burma, settled on the northern Irrawaddy, where they came into contact with the Peguan or Mun race, probably of Annamitic origin. The Burmans are Mongoloid, with a suggestion of the Aryan, with flat faces and broad skulls, black hair, rich brown skin, and brilliant black eyes. They are usually well-formed, medium-statured, thick-set, the men being fond of athletics. They wear a simple dress, consisting of *paso* and *tamcin*, the former for men, 10 yards long and a half-yard wide, which is hitched round the loins and disposed in various ways over the body, making a dress without buttons or strings, but with pockets and infinite capacities. The woman's garment, only 4½ feet long, is of cotton, silk or calico. The white cotton coat is common to both sexes. The old costume seems now to be giving way to a new tartan-like dress or garment,

about 9 or 10 feet long. On their heads they usually wear a knot of their own hair or brightly figured silk kerchiefs. They are very fond of personal decorations, and the native jewelers are expert at gold and silver work. The smoking of tobacco and the chewing of betel-nut are almost universal. The houses, usually set on piles, on account of river floods, are made of bamboo, laid on timber framework, and covered with the leaves of the palm, or by other suitable vegetable leaf and fibre. The Burmese are fairly industrious, but the women excel the men in variety of domestic employments. They are temperate and hearty, but not fond of continued labor. The number of festivals is very great, and they are enthusiastically kept and enjoyed by the people at large. Among the amusements may be mentioned boxing matches, pony, bullock, and boat races, cock-fighting, 'splitting the cocoanut,' chess, dominoes, and various sorts of juggling, snake-charming, etc. The Burman is excessively fond of pageants and frolics. In theatrical representations, as a rule, the hero and heroine are prince and princess, the countryman is a jester or clown, and the King's officers are courtiers or executioners. The King is consistently idealized, while his deputies are travestied. The ballet is very gay and animated, the dancers dressing in superb costumes. The entertainment often lasts several days or nights in succession, and it may consist of dialogues, music, interludes of dancing and posturing.

Other races besides the Burmans proper dwell within the limits of Burma; the Shans inhabit the eastern highlands, where they have semi-independent States, and the Kachins the northern. The Karens, in many respects an interesting people, are the most important hill race of the country, and best exemplify the mode of life of the aboriginal tribes, who have been kept out of the plain-lands by the more powerful Burmans. Those living in the mountains between Burma and Siam get their living by making forest clearings, on which they raise one crop, removing to another site every season. Those settled in the lowlands are more civilized, and speak and dress like Burmans. Noted for their hospitality, truthfulness, chastity, and spirit of equality, they are nevertheless given to drunkenness and to superstition. They are shorter and stouter than the Burmans, and of much fairer complexion. They employ elephants, and are good hunters, and do not marry until reaching mature life.

The language of the Burmese belongs to the same group as the speech of the Annamese, Siamese, and others speaking monosyllabic tongues. The alphabet seems to be a rounded form of Pali. The forms of speech tend to preserve relative ideas in the same categories as the terms expressing the ideas. The root remains unaltered; thus, instead of our 'herb,' 'shrub,' 'tree,' the Burman speaks of grain-plants, creeper-plants, timber-plants. Written Burmese literature goes back for over 800 years, and it is everywhere colored by Hindu influences.

RELIGION. The Burmese are the practical Buddhists of the world, their religion being of the Southern (Ceylonese) or purer variety, which most closely approximates the original form taught by Gautama. Even the Siamese are lax in comparison to the Burmese. Burma, isolated geographically between the mountains and the ocean, has remained, since the Fifth

Century, thoroughly imbued with Buddhism. It has been their great teacher and civilizer, stimulating the growth of a folk-lore and a national literature. It has prevented caste, and has covered the settled part of the country with temples, shrines, and monasteries, the latter being well organized. Theoretically, every boy in the country, while at the temple school, becomes a monk, though he is not bound by vows to remain. Tolerant and free from fanaticism, as well as from blood feuds, the Burmans show the blessings of the gentle teachings of the purer Buddhism. In sacred edifices the country is very rich; the tope, dagoba, or shrine is a solid mass of brickwork, shaped like a bell and crowned by an umbrella-like open ironwork. The temples contain many images of the Enlightened One, or Gautama, the Buddha of history; and the people never tire of plastering these images over with gold-leaf. The temples bristle on the sides and top with pointed projections which are usually gilded. The most famous temple in the country is in Pagan, a city founded A.D. 100. It flourished about A.D. 1000, and later fell into decay, its ruins covering nearly eight square miles. A tremendous expense was incurred in temple-building. At every shrine great bells are hung by metal clasps of rich design. At Mingum, near Mandalay, the bell, cast in 1790, weighs 88 tons. It is 17 feet in diameter, and the metal is 18 inches thick. The monastery buildings have roofs of several diminishing stages, elaborately adorned, but the special feature of Burman architecture is the pointed arch, used not only for doors and windows, but also in the vaulted coverings of passages. The ancient temples of Pagan consisted almost entirely of brick corridors, one within the other, with vaulted tent roofs, of masonry springing from the outer or lower wall to the inner or higher. Among the non-Buddhist tribes, spirit, nature, or demon worship prevails in more or less degrading form.

The early history of Burma is mythical and obscure. As is the case with many other peoples, the legendary accounts, preserved in old chronicles of the country, seem to point to an early immigration of the dominant race. It is supposed that the ancestors of the modern Burmese came from the Indian Highlands, on the northwest, at a period from 2000 to 2500 years ago; entered the valley of the Irrawaddy, the great river highway along which the whole history of Burma has been enacted; conquered the Mongoloid peoples then inhabiting the country, and gradually built up a new State. Tagoung, on the Upper Irrawaddy, the ruins of which still remain, is reputed to have been founded about B.C. 800. In the Eleventh Century A.D. Pagan, in Central Burmah, was the seat of power; its Kings consolidated the country, and conquered the land of Pegu on the south. The power of Pagan declined through the decadence of its rulers, and received a fatal blow from the assault of the Mongols, in the time of Kublai Khan. The Fourteenth Century saw the rise of the power of the rulers of Ava, the new centre of the kingdom, and the beginning of the long rivalry between Ava, the northern kingdom, and Pegu, in the south. The chronicles of the Kings of Ava claim for them descent from early Buddhist rulers in India, even going back to

Gautama himself. The power of Ava reached its zenith in the Fifteenth Century, when the history of the country becomes clearer through the accounts of Portuguese and other European traders, who entered the country and described its conditions. The supremacy passed temporarily from the Burmans to a line of kings from the Shan tribes on the Siamese border; but in 1580 the southern kingdom of Pegu became dominant over all Burma. The Peguan supremacy continued until 1752, but during the last century of this period there was a steady decline of the Burmese power. The French and English, meanwhile, secured a foothold in the Irrawaddy delta. In 1752 Alaungpura, or Alompra, the energetic warrior-chief of a village of Ava, headed a rising, overthrew the dominion of Pegu, and reorganized the Burmese Empire. He founded Rangoon (1755), the commercial centre of Burma. Troubles began in his reign with the English East India Company, which had established a factory in Burmese territory. Alompra died in 1760, during an invasion of Siam. The dynasty which he founded degenerated rapidly through intermarriage among its members. With one exception, Mindohn Min (1852-78), the successors of Alompra were bloodthirsty and tyrannical.

In 1795, in consequence of the violation of British territory by a Burmese force in pursuit of certain rebels, troubles arose, which were, however, quieted for a time. Difficulties over trading privileges followed, and frontier disputes occurred, culminating, in 1824, in a collision between armed forces of the East India Government and of Burma, on the Assam frontier. War was declared, and British forces at once invaded Burma. The common error of British campaigns, that of despising an unknown foe, led to failures at the beginning, but ultimately the Burmese were pressed so hard that a treaty was made at Yandabo, February 24, 1826, by which Burma renounced its claim on Assam and ceded to the British Government Arakan and the coast of Tenasserim, including Martaban, east of the Salwin River. Their defeat was a great blow to the national pride of the Burmese. King Tharawaddy, who obtained the throne in 1837 by the deposition of his brother, declared the treaty of Yandabo void, and treated English envoys with studied contempt until, in 1840, relations between the British and Burmese Governments ceased altogether. The extreme development in Tharawaddy and his son, Pagan Men, of the homicidal mania, which was the curse of the line of Alompra, led to a revolt which, in 1853, seated the brother of Pagan Men, Mindohn Min, on the throne. At the same time the intolerable treatment of English citizens had brought on the second war between Great Britain and Burma. In the spring of 1852 a British force captured Martaban and Rangoon, and the Peguans took the part of the British against the Burmese. In January, 1853, Pegu was proclaimed a part of the British Empire, which thus obtained control of the Burmese coast and of the mouths of Burma's three navigable rivers. Mindohn Min proved to be a wise and just ruler. Diplomatic relations were resumed in 1867 between Burma and Great Britain, and a commercial treaty was made. Two years before, a superstition had caused the abandonment of

the capital, Amaurapoora, for the new city Mandalay. Mindohn Min died in 1878, and the principal Queen, having no sons, married one of her daughters, Supayah Lat, to Theebaw, one of the youngest of the late King's sons. The other princes were seized and executed. Theebaw, arrogant, cruel, and weak, was a tool of his sanguinary Queen, who put all her rivals to death. The disorder resulting from the tyranny of their rule affected British trade, and led to new troubles with Great Britain; while an effort was made to establish a favorable connection with France. Trouble between the Burmese Government and the Bombay-Burma Company, which held a concession in the teak forests, presented an excuse for British intervention, which seemed necessary to prevent French influence from becoming paramount. The British invaded Burma, and on November 28, 1885, occupied Mandalay. The King and Queen were made captive and taken to Madras; all of Burma passed into British control, and in 1886 the annexation of Upper Burma to the dominions of the Queen-Empress Victoria was formally proclaimed. For several years there was much lawlessness, chiefly in the form of brigandage by the *dacoits*, or robbers, but by 1895 the country was practically pacified, and entered upon a new era under British rule. It is incorporated as a province of the Indian Empire under a Lieutenant-Governor. An agreement was concluded with France on January 15, 1896, making the Mekong River the boundary between the Shan States of Burma and French Indo-China. This boundary agreement gave France some territory east of the Upper Mekong, which formerly belonged to Burma. The development of railroads in Burma has now begun, and will open the resources of the country. The connection of Shanghai with India by way of the Upper Yangtse Valley and Upper Burma is claimed by some students of the Far Eastern situation to be essential to the maintenance of Great Britain's position in the East. See FAR EASTERN QUESTION.

Spearman, *The British-Burma Gazetteer*, compiled by authority (Rangoon, 1880); Schmitz, "Birma, die östlichste Provinz des indischen Kaiserreichs," in *Mitteilungen der geographischen Gesellschaft* (Vienna, 1898); Mason, *Burma: its People and Productions*, notes on the fauna, flora, and minerals, etc., rewritten and enlarged by Theobald (Hertford, 1882-83); Bird, *Wanderings in Burmah* (London, 1897); Ferrar, *Burmah* (London, 1898); Hart, *Picturesque Burma—Past and Present* (London, 1897); Yoe, *The Burman, his Life and Notions* (2d ed., London, 1896); Smeaton, *The Loyal Karen of Burma* (London, 1886); Phayre, *History of Burma* (London, 1883); Harner, *The Story of Burma* (London, 1901); Yule, *Narrative of the Mission in 1855* (London, 1858); Geary, *Burmah After the Conquest* (London, 1886). The writings of Archibald Colquhoun deal with the railway and frontier problems affecting Burma. An account of missionary activity in Burma will be found in Wayland, *Life of Adoniram Judson* (Boston and London, 1853).

BURMANN, bōō'mán, PETER (1668-1741). A Dutch philologist. He was born in Utrecht, and studied law at the universities of Utrecht

and Leyden, taking his degree in 1688. After practicing as an advocate for some years, he was appointed professor of history and rhetoric, and later became professor of Greek in Utrecht. In 1715 he removed to the University of Leyden. His chief works are editions of the Latin classics—Petronius, Velleius Paterculus, Quintilian, Valerius Flaccus, Phædrus, Ovid, the Poëtæ Minores, Suetonius, Lucan, Horace, and Vergil. They are characterized less by critical acumen than by learning and fullness.

BUR-MARIGOLD. A popular name of the widely distributed genus *Bidens*, of the order Compositæ. This genus includes a large number of annuals and perennial plants among which, in America, are the weeds called 'beggar-ticks,' 'Spanish needles,' and 'stick-tights.' Some species have very showy flowers, one of the finest in cultivation being the *Bidens grandiflora*, a native of South America. The botanic name *Bidens* is descriptive of the bidentate top of the seed or pappus.

BURMEISTER, bōō'r-mis-tēr, HERMANN (1807-92). A German naturalist, born in Stralsund. He studied medicine and natural history at Halle, and in 1837 became professor of zoology there. In 1848 he was a deputy to the German National Assembly, and afterwards was a representative in the first Prussian chamber. In 1850 he traversed part of Brazil in the interest of science, and visited other parts of South America a few years later, becoming in 1861 director of the National Museum at Buenos Ayres, where he died. He published many elaborate works on zoology, among them *Handbuch der Entomologie* (1832-55); *Systematische Uebersicht der Tiere Brasiliens* (1854-56); and *Physikalische Beschreibung der Argentinischen Republik* (1875).

BURMEISTER, RICHARD (1860—). A German-American pianist and composer, born in Hamburg. He studied under Liszt in 1881-84, made concert tours through Europe in 1883-85, and from 1885 to 1897 was the head of the piano department of the Peabody Institute in Baltimore. From 1897 to 1899 he was director of the Scharwenka Conservatory in New York City. His compositions include a concerto in D minor for pianoforte and orchestra, a ballade for pianoforte, an arrangement for pianoforte and orchestra of Liszt's *Concerto Pathétique*, for two pianofortes: *The Chase After Fortune* (described as a 'symphonic fantasy'), for orchestra; and a reorchestration of Chopin's F-minor concerto.

BURMESE (būr-mēs' or -mēs') WARE (first imported from Burma). Small cups and other vessels, made of strips of bamboo woven like fine basketwork, with the interstices filled with paste made of wood-oil and fine powders. When sufficiently hardened, the surface is smoothed with pumice-stone and water.

BURMESTER, bōō'r-me-stēr, WILLY (1869—). A German violinist, born in Hamburg. He studied in 1882-85 under Joachim at the musical high school in Berlin, became known for the brilliancy of his technique, and in 1890-91 was an instructor in the conservatory of Sondershausen. In 1895, at the instance of Georg Henschel, he appeared in England.

BURNABY, FREDERICK GUSTAVUS (1842-85). An English traveler and soldier. He was born

in Bedford, England, and was educated at Harrow and in Germany. Early in his life, he displayed his fondness for adventure. He entered the army in 1859, and by 1881 had command of his regiment, but he spent much of his time in travel, going first to Central and South America. He was military correspondent for the London *Times* with Don Carlos in Spain; and by that journal was sent to join Gordon in the Sudan. In 1875 he undertook his famous ride to Khiva, making his way, unaided and alone, to the heart of Asia, notwithstanding the Oriental laws forbidding the passage of foreigners into certain districts, and the efforts of the Russians to intercept him. In 1876-77 he rode on horseback through Asia Minor, and from Scutari to Batum. In 1880 he contested unsuccessfully, in the Conservative interest, the Birmingham seat in Parliament. He took part in the Egyptian campaign, and was killed in an engagement with the Mahdi's troops in January, 1885. Two of his books, in which he describes his exploits, reached enormous circulations: *A Ride to Khiva* (1876) and *On Horseback Through Asia Minor* (1877). They are both marked by strong anti-Russian and 'jingo' sentiments.

BURNAND, FRANCIS COWLEY (1837—). An English writer. He was educated at Eton and Cambridge, and was called to the bar in 1861. His success as a writer of burlesques led him to adopt literature as a profession. He has produced nearly a hundred dramatic pieces, among which *Ixion* and the burlesque of Jerrold's *Black-Eyed Susan* had remarkable runs. He became one of the leading contributors to *Punch*, and in 1880 succeeded Tom Taylor as its editor. From the pages of that periodical he has collected a number of volumes, among which the best known are *Happy Thoughts* (1870); *More Happy Thoughts* (1871); *Happy Thought Hall* (1872); *Quite at Home* (1890). He has also written two light operas in collaboration with Sir Arthur Sullivan.

BURNE-JONES, Sir EDWARD COLEY, Bart. (1833-98). An English painter. He was born in Birmingham, August 28, 1833. He was intended for the Church. In his youth he was sent to King Edward's Grammar School in his native town, and entered Exeter College, Oxford. There he formed his intimate and lifelong friendship with William Morris, who, himself leaning to poetry and the decorative arts, encouraged Burne-Jones as well to seek art as a career. Later, in London, Dante Gabriel Rossetti also strove to impress upon him the same idea. So, under the influence of these two men, Burne-Jones cut short his university course and established himself in London, with Rossetti as his master. In order to support himself while studying and painting, he designed numerous cartoons for stained-glass windows. Among these works is the Saint Cecilia window at Christ Church College, Oxford. Burne-Jones early made the acquaintance of Ruskin, whose writings, no doubt, greatly influenced him in his art. Of the Pre-Raphaelite painters of that period (see PRE-RAPHAELITE SCHOOL) he seems to have been the one who in time became most completely emancipated from the vagaries and extravagances that marked the early works of that school, and by his serious devotion to art made himself worthy of the cult and following which he afterwards

created. A man of wide culture and great poetic feeling, he naturally found inspiration for his brush in romantic legends and classic song and story. His master, Rossetti, says of his pictures that "they exhibit gorgeous variegation of color, sustained pitch of imagination, and wistful, sorrowful beauty, all conspiring to make them not only unique in English work, but in the work of all times and all nations." Burne-Jones has been extravagantly worshiped and praised, while at the same time his work was subject to the most bitter detraction. It was even held up to ridicule in the pages of *Punch*, and he himself alluded to by W. S. Gilbert in *Patience* as the 'greenery-gallery, Grosvenor-gallery' young man. But years of patient, cheerful, dignified work, marked by strong personal thought and expression, brought Burne-Jones at last to a sound reputation. He was made a D.C.L. of Oxford, was decorated with the French Legion of Honor, and in 1894 was made a baronet. The Royal Academy also elected him an associate in 1885, but as it did not further advance him to the full honors of academician, he afterwards resigned the associateship. Among his best-known works are "Venus's Mirror," "Chant d'Amour," "The Golden Stair," "The Wheel of Fortune," and "Cophetut and the Beggar Maid." Among his finest water-color drawings are the "Wine of Circe," "Love Among the Roses," "Dies Domini," and "Spring, Summer, Autumn, and Winter." Burne-Jones died in London, June 17, 1898. Consult Bell, *Edward Burne-Jones* (London, 1892).

BUR'NELL, ARTHUR COKE (1840-82). An English Sanskrit scholar, born in Saint Briavels. He studied at Bedford and King's colleges, and from 1860 to 1880 was connected with the civil administration of India. Everywhere he bought or copied Sanskrit MSS., 350 of which he presented in 1869 to the India Library. For the Madras Government he compiled what is, perhaps, his greatest work, a *Classified Index to the Sanskrit MSS. in the Palace at Tanjore* (1880). He was versed in Sanskrit and the dialects of Southern India, and also knew something of Javanese, Coptic, and Tibetan. His *South Indian Palæography* (1874, 2d ed., 1878) has been characterized by Prof. F. Max-Müller as "indispensable to every student of Indian literature." He further published translations from, and commentaries on, numerous Sanskrit MSS.

BURNES, Sir ALEXANDER (1805-41). A British officer and traveler. He was born in Montrose, Scotland, and belonged to the same family as Robert Burns, the poet. He early entered the Indian Army, and through his knowledge of Oriental languages gained rapid promotion. After undertaking several important missions for the Indian Government he was sent to explore the countries bordering on the Oxus and the Caspian. For greater safety, he adopted the dress and usage of the Afghans. On his return to England he was highly honored by the Royal Geographical Society and other associations, and was lionized generally. In 1839, having previously been knighted and promoted to the rank of lieutenant-colonel, he was appointed political resident at Kabul, where he was murdered on the breaking out of the insurrection in that city. He published *Travels into Bokhara* (2d ed. 1829).

BURNET (OF. *brunete*; cf. Med. Lat. *burneta*, springwort). The name of two allied and often united genera of Rosaceæ—*Sanguisorba* and *Poterium*. *Sanguisorba* has hermaphrodite flowers with four stamens; in *Poterium* the flowers are polygamous and the stamens indefinite in number. In both the calyx is four-parted and the corolla wanting. The great burnet (*Sanguisorba officinalis*) is common in meadows in all parts of Europe, particularly where the soil is calcareous. It has a stem 1 to 2 feet high, pinnate leaves, with about four pairs of ovate-serrated leaflets and an odd one; the flowers are crowded in dark-red spikes. In Germany it is grown as a forage crop for cattle. The root is astringent, and was formerly used in medicine. The common or lesser burnet (*Poterium sanguisorba*) grows on dry, calcareous soils in England and in central and southern Europe. It much resembles the great burnet, but the leaflets are smaller, and the reddish-green flowers are arranged in dense heads on long furrowed stalks. It is very resistant to drouth and cold, and its culture for forage has been recommended on dry, calcareous soils. Although it forms a great part of the natural pasture of the South Downs and other sheep-raising districts of England, it is not generally regarded as a very valuable forage plant. It is sometimes cultivated in gardens for its slightly astringent leaves, which are used for flavoring soups and salads. This plant has been introduced into North America, and grows wild in the northeastern part of the United States. Both this and the preceding are perennial plants. There are several other species, both of *Sanguisorba* and *Poterium*, some of the latter shrubby, natives chiefly of the warmer temperate parts of the world. *Poterium Canadense* is found in the northeastern United States.

BURNET, GILBERT (1643-1715). A British prelate and historian. He was born in Edinburgh, September 18, 1643, the youngest son of Lord Crimond. At the age of 10 he entered Marischal College, Aberdeen, being admitted M.A. at the age of 14. He inclined to the study of civil and feudal law, but at his father's wish, applied himself to divinity, and at 18 was ordained. In 1663, he made a six months' stay in Oxford and Cambridge, visited London, and next year journeyed through Holland and France, in Amsterdam perfecting himself, under a learned rabbi, in the Hebrew language. In 1665 he became minister of Saltoun; in 1669, professor of divinity in Glasgow University, but resigned in 1674, having incurred the enmity of his patron Lauderdale, by mixing in the polemics of the time. He removed to London, and was made preacher of the Rolls Chapel and lecturer at Saint Clement's. In 1676 he published his *Memoirs of the Dukes of Hamilton*, and in 1679 the first volume of his *History of the Reformation*, for which he received a vote of thanks from Parliament. Next year appeared *Some Passages in the Life and Death of the Earl of Rochester*, in which Burnet records the religious interviews which led to that profligate nobleman's conversion to Christianity. In 1681 he published the second volume of his *History of the Reformation*, and in 1628 his *Life of Sir Matthew Hale*. Renewed efforts were made to induce him to break with the Liberal Party and to attach himself to the King. He was offered the Bishopric of Chichester, but refused it, and

in 1683 narrowly escaped trouble in connection with the Rye House Plot. He conducted the defense, and attended the execution and vindicated the memory of his friend Lord William Russell. The King retaliated by depriving Burnet of his Saint Clement's lectureship. On the succession of James II. he went to the Continent, and traveled through France, Italy, Switzerland, and Germany. In 1684 he was introduced to the Prince of Orange, and when William went to England, accompanied him as royal chaplain, shortly after being appointed Bishop of Salisbury. He entered on his duties with ardor, but his first pastoral letter, in which he based the right of William to the throne on conquest, gave offense to Parliament, and they ordered it to be burned by the common hangman. William, who knew the excellent qualities of the Bishop, was not impressed by this solemn performance, and continued to trust Burnet to the end of his life. In 1698 Burnet was appointed preceptor of the Duke of Gloucester, and in 1699 published his exposition of the Thirty-nine Articles, which was condemned as heterodox by the House of Lords. In 1714 appeared the third volume of his *History of the Reformation*. He died of pleurisy in London, March 17, 1715. Soon after his death appeared Bishop Burnet's *History of His Own Time, from the Restoration of King Charles II. to the Conclusion of the Treaty of Peace at Utrecht, in the Reign of Queen Anne*. It was sarcastically but foolishly abused by Swift, Pope, Arbuthnot, and other Tory writers of the day. Burnet was a Broad Churchman, and was a man of almost puritanic virtue. He was distinguished by charity, geniality, and moderation. His style is neither elegant nor correct, and his judgment not always reliable; but honest simplicity and vigor, as well as fullness of detail, make his works valuable to the student of history. The best editions are the *History of His Own Time* (6 vols., Oxford, 1833); *History of the Reformation*, edited by Pocock (7 vols., Oxford, 1865). Consult "Biography of Burnet, by His Son," in the *History of His Own Time*.

BURNET, JACOB (1770-1853). An American jurist, prominent in the early history of Cincinnati, Ohio. He was born in Newark, N. J., graduated at Princeton in 1791, studied law under Judge Boudinot, and was admitted to the New Jersey bar in 1796. In the same year he removed to Cincinnati, then a straggling village, and from that time until his death was closely identified with public affairs in both city and State. He was a member of the legislative council of the Territory of Ohio from 1799 to 1802, was elected to the State Assembly in 1812, was one of the supreme judges of Ohio from 1821 to 1828, and from 1828 to 1831 was a member of the United States Senate. It was largely through his influence that the people in the Middle West were relieved, in 1821, of part of their heavy debt to the national Government for public lands, and in 1830 he took an active part in securing legislation which made possible the completion of the Miami Canal. For more than 50 years he was a leader in nearly all the public enterprises undertaken in Cincinnati. He helped establish the Lancasterian Academy there; was one of the founders of Cincinnati College, of which he was also first president; was president for several years of the Ohio Medical College, and of the Cincinnati Colonization Society; and

for some time was at the head of the Cincinnati branch of the United States Bank. He published *Notes on the Early Settlement of the Northwestern Territory* (1847), a work which contains much interesting information, and has been of value to subsequent writers on the history of the Northwest, and especially of Ohio.

BURNET, JOHN (1784-1868). A Scottish painter, engraver, and author. He was born in Edinburgh, and was apprenticed to Robert Scott, the landscape engraver. He was first brought to the notice of the public through his engravings of David Wilkie's works, which he executed in an admirable manner. Of his own paintings, the best-known engraving is that of "Greenwich Pensioners Receiving News of the Battle of Trafalgar." He wrote several works of art, illustrated by drawings and engravings of his own, the most important of which is a *Practical Treatise on Painting* (1827). He was also the author of *Rembrandt and His Works* (1849); and, in collaboration with Peter Cunningham, of *Life and Works of J. M. W. Turner* (London, 1852).

BURNET, JOHN (1863—). A Scottish scholar, born in Edinburgh. He studied at the University of Edinburgh and at Balliol College, Oxford, and in 1888 became an instructor at Harrow School. In 1890 he was appointed a fellow of Merton College, Cambridge, and in 1892 professor of Greek in Saint Andrews University. He has published scholarly works on *Early Greek Philosophy* (1892), a most excellent treatise, following in general the lines of Zeller's *Philosophie der Griechen* (1876); *Greek Rudiments* (1897); and *The Nicomachean Ethics of Aristotle* (1899). He has also edited Plato in the *Oxford Classical Texts* series.

BURNET, THOMAS (c.1635-1715). An English writer. He was born in Yorkshire, was educated at Cambridge, and in 1685 was elected Master of Charterhouse. Later he succeeded Archbishop Tillotson as chaplain in ordinary and clerk of the closet to William III. His *Telluris Theoria Sacra*, of which the first part appeared in Latin in 1681 and in English three years later, is an ingenious work, though its science was crude even for those times. In 1692 Burnet published his *Archæologia Philosophicæ, sive Doctrina Antiqua de Rerum Originibus* (also in English), which displayed great learning; but as it treated the Mosaic account of the fall as an allegory, and in particular burlesqued the conversation between Eve and the serpent, it gave great offense. His style, in both Latin and English, is dignified and often eloquent; but his speculations, once solemnly praised for their profundity, are now interesting only as a study in the history of philosophy, or for their colossal absurdities.

BURNET, WILLIAM (1688-1729). An American Colonial Governor, born at The Hague, Holland, the son of Bishop Gilbert Burnet. He was appointed Governor of New York and New Jersey in 1720, and immediately began to take an active interest in the competition between France and England for the control of the Indian trade. In 1722 he established, at Oswego, the first British trading post on the Great Lakes, and five years later, in spite of the vigorous protests of the French Governor of Canada, Beauharnais, and the niggardly support of the New York Assembly, built here a fort, which served to divert

much of the Indian trade from the French post at Niagara, and later played a prominent part in the French and Indian wars. In 1722, also, Burnet summoned to Albany, N. Y., the Governors or representatives of several other Colonies and persuaded them to unite with him in threatening war against the Eastern Indians, in case they did not agree to a satisfactory treaty with the English. He soon aroused the opposition of the traders and many others in the Colony, however, by his rigid enforcement of an act prohibiting the sale to French traders of goods commonly used in the Indian trade. In 1728 he exchanged the Governorship of New York and New Jersey for that of Massachusetts and New Hampshire, but in this latter position almost immediately became embroiled with the Massachusetts Assembly over the old question of the payment of a fixed salary to the Governor, the Assembly stubbornly insisting on its right to raise at its own discretion all money needed for the administration of the Colony. In this matter Burnet merely acted under the explicit instructions of the home Government, the House of Commons having passed a resolution that the contention of Massachusetts tended 'to shake off the dependency of the said Colony upon their kingdom'; but the Assembly remained obdurate, and Burnet was never able to carry his point.

Though obstinate and headstrong, and frequently without tact, Burnet was an honest and capable administrator, and sincerely desired to promote the welfare of the Colonies over which he presided. He deserves especial praise for his far-sighted Indian policy in New York, which did much to further the interests of England in the long and stubborn contest with France for commercial and territorial supremacy in the Northwest.

BURNETT, FRANCES ELIZA HODGSON (1849—). A novelist who was born in England, but has been identified with American literature. She was born in Manchester, November 24, 1849, came to the United States at the close of the Civil War, and lived in Tennessee until her marriage (1873) to Dr. S. M. Burnett. She has since lived in Washington and Europe. She first gained notice by "Surly Tim's Trouble," in *Scribner's Magazine* (1872), and her reputation was firmly established by *That Lass o' Lowrie's* (1877). The most noteworthy of her later novels are *Haicorth's* (1879) and *A Lady of Quality* (1896), both dealing with English life; *A Fair Barbarian* (1881); *Through One Administration* (1883); and *In Connection with the De Wiltoughby Claim* (1899). Her most successful book, *Little Lord Fauntleroy* (1886), is an Anglo-American story, and has been dramatized by its author. She also wrote a play, *Esmeralda* (1881), with W. H. Gillette, founded on one of her short stories; and, in collaboration with Stephen Townsend, dramatized *A Lady of Quality*. Divorced from Dr. Burnett in 1898, she afterwards married Stephen Townsend. She published in 1901 *The Making of a Marchioness*.

BURNETT, JAMES, LORD MONBODDO (1714-99). A Scottish writer and judge. He was born in Kincardineshire, and was educated at Aberdeen and Groningen. He early exposed himself to ridicule by asserting that man is but a civilized species of monkey. This theory he elaborated in his *Dissertation on Language* (6 vols., 1773-92) and in *Ancient Metaphysics* (6 vols.,

1779-99), written respectively to show the superiority of the ancients in literature and in philosophy.

BURNETT, PETER HARDEMAN (1807-95). The first Civil Governor of California. He was born in Tennessee, but early removed to Missouri, and afterwards emigrated to Oregon, where he took a prominent part in the organization of its Territorial Government and served two terms in the Legislature. In 1848 he accompanied one of the first companies of gold-seekers to California. Here he soon attracted attention by urging the organization of a civil government for the State without awaiting Congressional authority. Immediately after the adoption of the new Constitution he was elected Governor, but resigned in 1851, and was afterwards judge of the Supreme Court (1857-58) and president of the Pacific Bank of San Francisco (1863-80). He published *The Path Which Led a Protestant Lawyer to the Catholic Church* (1860); *The American Theory of Government Considered with Reference to the Present Crisis* (1861); *Recollections of an Old Pioneer* (1878); and *Reasons Why We Should Believe in God, Love God, and Obey God* (1884).

BURNETT PRIZES, THE. Two prizes in the theology founded by John Burnett of Dens, Aberdeenshire. This gentleman, who was born in Aberdeen in 1729, and died there in 1784, was a general merchant in Aberdeen, and for many years during his lifetime spent £300 annually on the poor. On his death, he bequeathed the fortune he had made to found the above prizes, as well as for the establishment of funds to relieve poor persons and pauper lunatics, for inoculation, and to support a jail chaplain, in Aberdeen. He directed the prize fund to be accumulated for 40 years at a time, and the prizes (not less than £1200 and £400) to be awarded to the authors of the two best treatises on "The evidence that there is a Being all-powerful, wise, and good, by whom everything exists; and particularly to obviate difficulties regarding the wisdom and goodness of the Deity; and this independent of written revelation, and of the revelation of the Lord Jesus; and from the whole to point out the inferences most necessary and useful to mankind." The first prize was awarded in 1815 to William Laurence Brown, and the second to John Bird Sumner, in 1848 Archbishop of Canterbury; in 1855 the first to Robert A. Thomson, and the second to John Tulloch, in 1860 principal of Saint Andrews, and the essays were published. The fund was in 1883 applied to the foundation of a lectureship on natural theology in the University of Aberdeen.

BURNETT SALMON. A local name in Queensland for the Australian lungfish (*Ceratodus Fosteri*). See BARRAMUNDA.

BURNEY, CHARLES (1726-1814). An English composer, well known as the author of a *General History of Music*. He was born in Shrewsbury. Having studied music in his native city, in Chester, and under Dr. Arne in London, he began to give lessons in music. After composing three pieces—*Robin Hood*, *Alfred*, and *Queen Mab*—for Drury Lane, Burney left London and settled as organist at Lynn, in Norfolk, where he planned his work on the *History of Music*. In 1770-72, he traveled in France, Italy, the Netherlands, and Germany, collecting mate-

rials for his projected work, and published an essay on the *Present State of Music in France and Italy*, etc. (1772); *The Present State of Music in Germany, the Netherlands and United Provinces*, etc. (1773). This was followed by his *General History of Music from the Earliest Ages to the Present Period* (4 vols., 1776-89). It has retained a good deal of its value, especially in the early parts of the work treating of the music of the ancients. Besides some minor works, Burney wrote a memoir of Handel and nearly all the musical articles in *Rees's Cyclopædia*. He was appointed organist at the hospital in Chelsea in 1789. He died in Chelsea. He was intimately acquainted with many of the most eminent men of his time, including Edmund Burke and Dr. Johnson. His second daughter was the famous writer Frances Burney (afterwards Madame D'Arblay).

BURNEY, FRANCES. See D'ARBLAY, MADAME.

BURNHAM BEECHES. The remains of an ancient forest in Buckinghamshire, England, twenty-five miles northeast of London, noted for its immense beech-trees. The poet Gray, early in the Eighteenth Century, aroused interest in this wild and picturesque tract. In 1879 the London corporation purchased the surrounding 374 acres, and in 1883 set them apart for public use. Consult Heath, *Burnham Beeches* (London, 1880).

BURNHAM, SHERBURNE WESLEY (1838-). An American astronomer, born at Thetford, Vt. and educated at the academy there. Although a stenographer by profession, he became interested in astronomy and particularly in double stars, a field in which he soon had made many important discoveries. In 1876 he became associated with the Chicago Observatory, then with the Lick, and finally accepted the chair of practical astronomy at the University of Chicago. In 1894 he was made a fellow of the Royal Astronomical Society and was awarded a gold medal in recognition of his achievement of having recorded 1274 new double stars. His general catalogue of stars which he discovered was issued in 1900 as Vol. I. of the Publications of the Yerkes Observatory.

BURNING BUSH. See SPINDLE-TREE.

BURNLEY (the *Brun* or *Burn* river + *lea*, AS. *leah*, meadow, field). A thriving town and Parliamentary and county borough in Lancashire, England, on the Brun, and on the Leeds and Liverpool Canal, 24 miles north of Manchester (Map: England, D 3). The town was incorporated in 1861 and made a county borough in 1889. It owes its prosperity and rapid growth to the development of the textile industry. It has factories for the weaving, spinning, and printing of cotton, and for the manufacture of weaving machinery. There are slate-quarries and collieries in the vicinity. The town owns its water-works, gas-works, and electric-lighting plant, public markets, and slaughter-houses, all of which yield a substantial income. In 1887 it bought out the sewage works and added a profitable sewage plant in 1889. The city provides public baths, a municipal technical school, a sanatorium, and a Victoria Hospital. The population has risen from 29,000 in 1861, to 87,000 in 1891, and 97,000 in 1901.

BURNOOSE, *būr-nōōs'*, or **BURNOUS** (Ar. *burnus*, *burnās*, a hooded cloak, whence Fr.

burnous, Ger. *Burnus*, Russ. *burnusŭ*, *burnuzŭ*). The name of a garment worn in parts of North Africa. It is a large woolen mantle, worn above the other attire of the natives, and having a hood, which is thrown over the head in rainy weather. The burnoose is generally white, though distinguished individuals wear it of various colors. It has been long in use among the Spaniards under the name of *albornoŝ*. Through the conquest of Algeria by the French, the burnoose was imported into France and England, although its original form has been considerably altered.

BURNOUF, bur'noof', EMILE LOUIS (1821—). A French Orientalist, cousin of Eugène Burnouf. He was born in Valognes, France, August 25, 1821; lectured for a time in Nancy, on ancient literature, and subsequently was director of the French school in Athens. Among his works are *Méthode pour étudier la langue sanscrite* (3d ed., 1885); *Essai sur le Vêda* (1863); *Dictionnaire classique sanscrit-français* (1863-65); *Histoire de la littérature grecque* (1869); *La ville et l'Acropole d'Athènes aux diverses époques* (1877); *La mythologie des Japonais* (1878); and *Le catholicisme contemporaine* (1879).

BURNOUF, EUGÈNE (1801-52). A French Orientalist, one of the most distinguished of modern times. He was born in Paris, August 12, 1801, and after entering on the study of law, devoted himself to the Oriental languages, especially those of India and Persia. In conjunction with Professor Lassen of Bonn, he published, in 1826, *Essai sur le Pali*, which was followed, in 1827, by *Observations grammaticales sur quelques passages de l'essai sur le Pali*. His great aim, however, at this time, was to obtain a complete knowledge of the remains of the language and religious literature of the Avesta (q.v.), which had been neglected since the time of Anquetil du Perron, or, at least, not philologically and critically examined. Burnouf undertook to decipher those curious MSS. which Anquetil du Perron had brought home with him, and which lay unregarded in the Bibliothèque Impériale. He commenced by causing the *Vendidad-Sadé* to be lithographed with great care and published from time to time in the *Journal Asiatique*. In 1832 he became a member of the Academy of Inscriptions, and in the same year succeeded Chézy as professor of Sanskrit in the Collège de France. In 1834 he published the first volume of his *Commentaires sur le Yaçna, l'un des livres liturgiques des Parses*, a work which, for the first time, rendered possible a knowledge not only of the dogmas, but also of the language of Zoroaster. It is a masterpiece of conscientious industry and scholarly acumen for the time, but too comprehensive in its scope to allow the work ever to be completed. His studies in the Avestan language induced him to make an attempt to decipher the cuneiform inscriptions of Persepolis, in his *Mémoire sur deux inscriptions cunéiformes* (Paris, 1836). In 1840 he published the text along with a translation of the *Bhagavat-Purana*, a system of Indian mythology and tradition. As the fruit of his study of the Sanskrit books of the Buddhists, he published in 1845 the *Introduction à l'histoire du Bouddhisme indien*. (See BUDDHISM.) This great work absorbed for six years the whole energies of Burnouf, who was now the recognized successor of Silvestre de Sacy. He died May 28, 1852.

VOL. III.—41.

BURNOUF, JEAN LOUIS (1775-1844). A French philologist, born at Urville (Manche). In 1807 he became an assistant professor at the Collège Charlemagne, and in 1816 professor of eloquence. From 1840 he was librarian of the university. He did much to promote the interests of classical studies in France, in particular through such works as his *Méthode pour étudier la langue grecque* (1814; last ed. 1893). He also prepared an excellent translation of Tacitus (6 vols., last ed. 1881).

BURNS, ANTHONY (c.1830-62). A celebrated fugitive slave. He escaped from slavery late in 1853, but was arrested in Boston on May 24, 1854, under the provisions of the Fugitive Slave Law of 1850, and, pending a trial, was confined in the Boston Court House. News of his arrest spread rapidly and the people of Boston, already indignant over the passage of the Kansas-Nebraska Bill (q.v.), were quickly aroused to a high pitch of excitement. On the evening of the 26th a great crowd met in mass meeting at Faneuil Hall and listened to fiery addresses by Wendell Phillips and Theodore Parker, but soon adjourned, amid scenes of great excitement, to help forward a premature effort at rescue then being made by a small party under Thomas W. Higginson (q.v.). The attempt completely failed, however, after one of the marshal's posse had been killed and a number of the rescuing party had been more or less severely injured, and on June 2 Burns was formally adjudged to his owner by the United States Commissioner. Under the escort of a strong guard, he was taken through the streets and placed on board a United States revenue cutter, the houses along the line of march being draped in deep mourning and flags being everywhere placed at half-mast. Burns's freedom was procured in the following year with money collected by a colored preacher of Boston. He subsequently studied at Oberlin, and for several years was pastor of a church in Saint Catharines, Canada. He was 'the last fugitive slave ever seized on the soil of Massachusetts.' Consult: C. E. Stevens, *Anthony Burns: A History* (Boston, 1856), and interesting accounts in T. W. Higginson, *Cheerful Yesterdays* (Boston, 1898), and C. F. Adams, Jr., *Richard Henry Dana, A Biography* (Boston, 1891).

BURNS, JOHN (1858—). An English labor leader, born in Vauxhall, London. From 1868 he was apprenticed to various trades, finally to engineering at Millbank, and for a year was a foreman engineer in West Africa. By his platform oratory, he became prominent as a representative of working men, and as an official of the Amalgamated Engineers' Association was also well known. He defended the right of public meeting in Trafalgar Square in 1887, and was imprisoned for six weeks for resisting the police. In 1885 he was defeated as Socialist candidate for Parliament from West Nottingham, and in 1889 was a member of the committee which effected a settlement in the great London dock strikes of that year. He was a member of the London county council, and was in 1892 returned to Parliament for Battersea. He has published pamphlets and speeches.

BURNS, ROBERT (1759-96). The great lyric poet of Scotland. He was born at Alloway, in Ayrshire, January 25, 1759. His father, then a

nursery gardener, and afterwards the occupant of a small farm, had to struggle all his life with poverty and misfortune, but made every exertion to give his children a good education; and the boy was able to enjoy a considerable amount of instruction and miscellaneous reading in spite of his poverty. Among the books placed in his way were the *Spectator*, Locke's *Essay*, and Pope's *Iliad*. He learned French and some Latin; and he knew Allan Ramsay and the popular songs of Scotland. In his seventeenth year he wrote his first poem, addressed to Nelly Kilpatrick, by whose side he had worked in the fields. In 1777 he was sent to study surveying in the house of his uncle, Samuel Brown, at Ballochneil. Here he fell into the company of some 'jovial smugglers,' and began to realize the force of the traditional association of wine, woman, and song. His father was now trying another farm at Lochlea, near Tarbolton, to which the young poet returned, probably feeling himself not a little of a man of the world. In 1780 he was one of the founders of a 'Bachelor's Club' at Tarbolton, at whose meetings such weighty topics as the relative merits of love and friendship were gravely discussed. The love affairs which have provoked so much ethical controversy continually beset him. The generally lax morality of the Scotch peasantry at the period may partly account for, if not excuse, his failings in this direction. He was for a while seriously smitten by the charms of a farmer's daughter named Ellison Begbie, who is supposed to be the original of his Mary Morison; but she prudently declined an alliance, and in the summer of 1781 he went to Irvine to join a relative of his mother's in a flax-dressing business; but a convivial celebration of the next new year's advent ended in the burning down of the shop. Returning to Lochlea, he lived quietly and temperately after this reverse; and after his father's death, in 1784, he and his brother Gilbert settled on a small farm, which they had taken in the previous autumn at Mossgiel, near Mauchline. Here he became acquainted with several educated men and wrote some of his finest poems, such as "The Jolly Beggars," "The Cot-tar's Saturday Night," and the lines "To a Mouse." He had already begun to think of publication, his brother having assured him that his "Epistle to Davie" would 'bear being printed,' when the perplexing consequences of his love affair with Jean Armour (to whom he had given, under pressure, a written certificate that she was his wife, but who had been induced to repudiate him) determined him to emigrate. He accordingly published a volume of poems in July, 1786, with a view to making his passage-money to Jamaica. Meantime, from May to October of the same year (while still able to protest on June 6 that he loved Jean to distraction), he developed a passionate attachment to Mary Campbell, who died of a fever, and was commemorated by some of his most pathetic poems, "To Mary in Heaven" and "Highland Mary." The success of his little volume and negotiations for a second edition decided him to stay in Scotland, and finally in November drew him to Edinburgh. Here he was received with enthusiasm in good society, and made a favorable impression by the 'dignified plainness and simplicity' of which Scott, who then saw him,

speaks. From the second edition of his poems (April, 1787) he received in the end about £500. While waiting for payment he traveled agreeably in various company, and renewed his old relations with Jean Armour, to whom he was legally married in August, 1788. Before this, in March, he had been appointed to a place in the excise, and had taken the lease of a farm at Ellisland, near Dumfries. The farm not paying too well, Burns took up his duties as excise-man, and discharged them vigorously, though not with excessive sternness. Here he wrote "Tam o' Shanter" in a single day for Grose, the antiquarian, in whose *Antiquities of Scotland* (1791) it was first published. In December, 1791, having given up his farm, he settled in Dumfries on a salary of £70 a year. Some unguarded political expressions drew upon him the suspicion of the Government, and he came near losing his post. Possibly embittered by what he felt to be injustice, he allowed his habits of dissipation to grow on him, to the detriment of both his reputation and his health. All the while, however, his poetical activity continued, though he indignantly refused offers of a regular salary for contributions to the *London Star* and *Morning Chronicle*. Broken in health and spirits, he died July 21, 1796.

Burns was of about the average height and of heavy build, with features inclined to coarseness. According to Scott, the portraits (of which the most trustworthy is that by Nasmyth, 1787) have unduly refined them. His face became singularly animated and expressive in conversation, and numerous observers have commented on the extraordinary glow of his fine eyes. "I never saw such another eye," says Scott, "in any human head." His character has perhaps been sufficiently indicated above; but if regretably weak in certain directions, it had very respectable elements—an honorable pride, a sense of duty toward his relatives, and a real desire to act a manly and not a heartless part. His poetry was nearly always written on the spur of the moment—the response of the feelings to the immediate circumstances. Its charm and power lie in the justness of the feelings expressed, and in the truthfulness and freshness which it derives direct from life. Seldom have such manliness, tenderness, and passion been united as in the songs of Burns. He is weak only when, acting on bad advice, like David in Saul's armor, he tries to write in the conventional English instead of the simple, natural Scottish dialect. He had no slight influence in preparing the way for that outburst of the natural in English poetry, whose epoch-making date, the publication of the *Lyrical Ballads*, falls only two years after his death. The hundredth anniversaries of his birth and death were celebrated with immense enthusiasm, not only in Scotland, but throughout the English-speaking world.

For editions of Burns consult: Chambers, with Life and Letters, revised by Wallace (4 vols., Edinburgh, 1896); Douglas, with Life and estimate by Nichol (7 vols., Edinburgh, 1896); Henley and Henderson, centenary edition (4 vols., Edinburgh, 1896-97); and for his life, Lockhart (latest edition, Edinburgh, 1890); Shairp, in *English Men of Letters* series (London, 1879); Angellier, *Robert Burns, sa vie et ses œuvres* (Paris, 1893); and Higgins (London.

ROBERT BURNS
FROM THE PAINTING BY P. KRÄMER

1893). Consult also: Wallace (editor), *Correspondence Between Burns and Mrs. Dunlop* (London, 1898); Carlyle, *Essays* (London, 1847); Stevenson, "Robert Burns," in *Familiar Studies of Men and Books* (London, 1882); McKie, *Bibliography of Burns* (Kilmarnock, 1861).

BURNS, WILLIAM CHALMERS (1815-68). A Scottish Protestant missionary to China. He was born at Dun, Forfarshire, April 1, 1815; was educated in Aberdeen; practiced law; then became a minister in 1839. He carried on extensive revivals in Great Britain, Ireland, and Canada, but in 1847 went out as a Presbyterian missionary to China. He adopted Chinese dress and lived like a native. He had much facility in acquiring the spoken language, and labored with great enthusiasm in many places. In this way he became widely known. Everywhere he commended himself by his faith, piety, courage, and unselfishness, and is still held in loving remembrance. He died at Nieu-chwang, April 4, 1868. Consult Burns, *Memoir of William Chalmers Burns* (New York, 1870).

BURNS, WILLIAM WALLACE (1825-92). An American soldier. He was born in Coshocton, Ohio, and in 1847 graduated at West Point. He served in the war with Mexico, and was in the field with the Army of the Potomac from 1861 to 1863, during which time he attained the rank of major-general of volunteers. Later he became chief commissary of the Department of the Northwest, and during the last part of the war was chief commissary of the Department of the South. He received the brevet of brigadier-general in 1865, and was on duty in the Commissary Department at Washington until 1889, when he retired, with the regular rank of colonel.

BURNS AND SCALDS. A burn is an injury to the body produced by heat or corrosive substances. A scald is an injury produced by a heated liquid or vapor. Practically three degrees of burns are recognized by surgeons: (1) Burns resulting in a simple reddening of the skin. (2) Burns characterized by the formation of vesicles or blebs. (3) Burns resulting in sloughing and the formation of a scar, including all gradations of severity, from partial destruction of the true skin to incineration of skin, muscle, and bone. Symptoms: Pain and shock, to be relieved by opiates and stimulants. If the denuded surface be large the patient may suffer from cold, in addition, to be combated with voluminous dressings and artificial heat from bottles and hot enemata. Cleanliness and exclusion of air are sought in local dressings, to lessen suppuration, and the object of later treatment is promotion of the growth of skin. Vaseline or preparations of boric acid are useful. Contracting scars often result, causing deformity. To obviate this result, skin-grafting and splints so adjusted as to secure surface extension are employed. Later plastic operations may relieve deformities. (See **AUTOPLASTY**.) The extent of surface affected determines in part the danger of a burn. Death may follow injury to a third of the surface of the body; it is quite certain to follow injury to one-half the surface. Children bear burns very badly, and burns about their faces or necks are more dangerous than those of similar extent in other regions.

BURNSIDE, AMBROSE EVERETT (1824-81). An eminent American soldier, prominent on the Federal side during the Civil War. He was born in Liberty, Ind.; attended a village school, and at seventeen was indentured to a merchant tailor; but soon afterwards was appointed to the United States Military Academy, where he graduated in 1847. He then spent some years in garrison duty, but later resigned from the service, and from 1853 until 1858 was a manufacturer of firearms at Bristol, R. I., inventing the Burnside breech-loading rifle in 1856. On the outbreak of the Civil War he entered the Federal Army, and from May to August, 1861, was colonel of Rhode Island volunteers, participating as such in the first battle of Bull Run. He became brigadier-general of volunteers on August 6, was engaged in organizing the 'Coast Division' of the Army of the Potomac from October, 1861, to January, 1862, and commanded the Department of North Carolina from January to July of this year, during which time he captured Roanoke Island, occupied Newbern, N. C., and forced the surrender of Fort Macon, Beaufort. On March 18, 1862, he was raised to the rank of major-general of volunteers. He was then placed in command of the reinforcements intended for the Army of the Potomac, which later constituted the Ninth Army Corps, and in July was offered, but emphatically refused, the chief command of the Army of Virginia. After the second battle of Bull Run he was again offered the chief command, the Army of Virginia now being merged into the Army of the Potomac; but he again declined it, and served under McClellan as commander of the Ninth Corps in the Maryland campaign against Lee, participating in the battle of South Mountain, and commanding the left wing in the battle of Antietam on September 17. (See **ANTIETAM, BATTLE OF**.) Though still feeling that he was unqualified for the position, he was finally—on November 10—placed in command of the Army of the Potomac, and conducted the campaign against Lee, which virtually ended with the overwhelming defeat of the Federals at Fredericksburg, on December 13. Burnside attacked on this occasion with foolhardy recklessness, and, in general, proved unequal to the task assigned to him. (See **FREDERICKSBURG, BATTLE OF**.) On January 26, 1863, he was replaced by Hooker, and from March to December he was in command of the Department of the Ohio, during which time he captured Cumberland Gap, marched into East Tennessee, and occupied Knoxville, where for some time he was besieged by the Confederate General Longstreet. On April 13 he issued his famous "General Order No. 38," directed against the 'Copperheads' in his department, and especially against Vallandigham, who was soon afterwards arrested, convicted, and imprisoned. (See **VALLANDIGHAM, CLEMENT L.**) This order, together with his "General Order No. 84," which prohibited the circulation of the *New York World* and suppressed the *Chicago Times*, aroused the most violent opposition as striking at the freedom of speech and of the press; and President Lincoln yielded to the popular demand so far as to rescind that part of the latter order which suppressed the *Times*. From May to August, 1864, Burnside served under Grant, as commander of the Ninth Corps in the Richmond Cam-

paign, taking part in all the important battles during that time, and having charge of the mine operations at Petersburg. For his conduct on this latter occasion, he was subsequently censured by a court of inquiry which, after a prolonged investigation, found him, along with several other officers, 'answerable for the want of success.' Many military critics, however, have since contended that Burnside was not really at fault, and that the responsibility for the fiasco should be placed elsewhere. On April 15, 1865, Burnside resigned from the service, and subsequently was prominent as a projector and manager of railroads. He was Governor of Rhode Island from 1866 to 1869, and from 1875 until his death was a member of the United States Senate. In 1870 he visited Europe, and during the siege of Paris acted as a medium of communication between the French and Germans. As a soldier he rendered valuable services in the capacity of corps commander, but proved unable to cope with the problems and difficulties which fall to the lot of a commanding general. Consult: Poore, *Life and Public Services of Ambrose E. Burnside* (Providence, 1882), and Woodbury, *Major-General Burnside and the Ninth Army Corps* (Providence, 1897).

BURNTISLAND, bŭrn't'land. A seaport of Fifeshire, Scotland, on the north shore of the Firth of Forth, about eight miles north-north-west of Edinburgh (Map: Scotland, E 3). Its streets are clean and well kept. Burntisland is an important station of the North British Railway, having a steamboat ferry connecting it with Granton, the station on the opposite side of the Forth. It has a commodious harbor, which was greatly improved in 1876. Its industries consist principally of distilling, oil-refining, and the shipping of coal and iron. In summer it is much frequented as a watering-place. Together with Kinghorn, Dysart, and Kirkcaldy it sends one member to Parliament. Population, in 1891, 4692; in 1901, 4726.

BURNT SIENNA, si-ŕn'na. A fine orange-red pigment, transparent and permanent, used in both oil and water-color painting. It is obtained by simply burning the ferruginous ochreous earth known as Terra di Sienna. Excellent greens are produced by mixing it with Prussian blue. It mixes well with other pigments generally, dries quickly, and is most valuable in warming and enriching shadows.

BURNT STONES. A variety of carnelian usually found in ruins. They have a dull appearance externally, but exhibit a beautiful red color when held up to the light. This peculiar effect is supposed to have been produced by fire, and has been imitated by burning the upper surface of the gem with a hot iron. They were formerly highly prized, especially if handsomely cut.

BURNT UMBER. A pigment of a russet-brown color. It is semi-transparent, mixes well with most other pigments, and dries quickly. It is obtained by burning umber, an ochreous earth containing manganese, and deriving its name from the place where it was first discovered—Umbria, in Italy.

BUR-OAK. See OAK.

BURR, AARON (1716-57). An American clergyman and educator. He was born in Fairfield, Conn., and graduated at Yale in 1736. Two years later he became pastor of the Presbyterian

church in Newark, N. J., and in 1748 second president of the College of New Jersey, now Princeton University. As his predecessor, Jonathan Dickinson, was president only a few months, Dr. Burr, in his administration of nine years, really laid the foundations of the college. He was a thorough scholar and an eloquent preacher. His wife was the daughter of Jonathan Edwards. He was the father of Aaron Burr (1756-1836). Dr. Burr published a Latin grammar known as *The Newark Grammar* (1752); *The Supremacy of Our Lord Jesus Christ* (new ed. 1791), and several sermons.

BURR, AARON (1756-1836). An American politician, Vice-President of the United States from 1801 to 1805. He was born in Newark, N. J., February 6, 1756, and was the son of the Rev. Aaron Burr, D.D., second president of Princeton College, and the grandson of Jonathan Edwards (q.v.), the famous theologian. His paternal grandfather, according to Hildreth, was a German who had settled originally at Fairfield, Conn. His father died in 1757 and his mother in the following year, and he, with his sister, was brought up by his maternal uncle, the Rev. Timothy Edwards, at Elizabethtown, N. J. He graduated at Princeton in 1772, studied theology under the Rev. Dr. Bellamy, of Bethlehem, Conn., and then (1774) studied law with Tappan Reeve, his brother-in-law, in Litchfield, Conn. He entered the Continental Army in 1775, soon after the battle of Bunker Hill; took part in Benedict Arnold's Canadian expedition; became in turn a member of Washington's military family (April, 1776), and an aide to General Putnam (June, 1776); served with distinction as lieutenant-colonel at Hackensack and Monmouth (q.v.), where he commanded a brigade; was placed in command of the American line in Westchester County (N. Y.)—in the so-called Neutral Ground—in January, 1779; and in March of this year resigned from the service. He was involved in the opposition to Washington, and at the time of the more serious friction sided with Lee and Gates. (See CONWAY CABAL THE.) In 1782 he began the practice of the law at Albany, N. Y. In July of the same year he married Mrs. Theodosia Prevost, the widow of a British officer who had died in the West Indies, and in the following year their only child, Theodosia, was born in New York. (See BURR, THEODOSIA.) In 1833 Burr, then in his seventy-eighth year, married Madame Jumel, the widow of a French merchant, who had an estate in the northern part of Manhattan Island, and who possessed some property. Much of this property was soon spent by Burr, and the couple separated, but were never divorced.

Burr definitely established his home in the city of New York, in December, 1783, soon after his first marriage, and his political activity and advancement there soon became marked. He was a member of the State Assembly in 1784-85, and again in 1797-99; was Attorney-General of the State in 1789; was a member of the United States Senate from 1791 to 1797; and in 1801, just before becoming Vice-President, was chairman of the Constitutional Convention at New York. In 1792 he declined a nomination to the Supreme Court of New York. He was an early, zealous, and unscrupulous leader among the Republicans (afterwards Democrats), and the especial rival of Alexander Hamilton, the

prominent leader of the Federalists. In the Presidential struggle of 1800, John Adams (then President), Thomas Jefferson, Charles C. Pinckney, and Burr were the candidates, and the votes for Jefferson and Burr, the two Republican candidates, were equal—73 for each. As the Constitution then provided, the person having the largest number of electoral votes was to be President, and the person having the next largest number was to be Vice-President. The equal division threw the election into the House of Representatives, where each State had one vote only, the vote of a majority of all the States being necessary for a choice. After a week of balloting Jefferson was chosen President, and Burr therefore became Vice-President. He was charged, unjustly it seems, with having exerted himself to defeat Jefferson, who was the regular Presidential candidate of his party, and his alleged intrigues to this end ruined him politically as a Republican. In 1804, however, he ran as an independent candidate for governor of New York and received the support of some of the Federalists, but was defeated by Morgan Lewis. For this Burr blamed Hamilton, who had undoubtedly used all of his influence against him, both on this occasion and in 1801, and these disappointments and failures, added to the intensely bitter character of the partisan warfare of the time, led to a duel, at Weehawken, N. J., on July 11, 1804, in which Hamilton, who discharged his weapon into the air, was killed by Burr. In the spring of 1805 Burr started for the western part of the country, bent upon the conquest of Mexico and the establishment there of a separate government, with himself as chief. It was in the course of these operations that he brought ruin upon his friend Harman Blennerhassett (q.v.). In 1806 President Jefferson was informed, in part, of Burr's schemes by General Wilkinson, in whom Burr had partially confided, and Burr was soon arrested at Frankfort, Ky. He was defended by Henry Clay, and was acquitted after an exciting trial. He was again arrested at Natchez in January, 1807, but was released by the Grand Jury, and on February 19, in Alabama, he was a third time arrested. After a long and memorable trial at Richmond, Va., first on a charge of treason and then on a charge of misdemeanor, he was again acquitted, and in June, 1808, sailed for Europe to raise means for prosecuting his schemes. Four years of effort in England, Sweden, Germany, and France resulted in nothing but failure, and in 1812 he returned in extreme poverty, and opened a law office in New York; but his course had alienated the people, and he met with only moderate success.

Henry Adams, after showing how Burr had "endeavored by the foul means of a Federal alliance to acquire the Presidency," goes on to say, with a vehemence which is really partisan, that "a more gross betrayal of confidence could hardly be conceived, even in political life. He had made it clear that his heart was set upon personal aggrandizement, and not upon a Republican success. His untrustworthiness appeared the more despicable by comparison with the strictly honorable conduct of Jefferson, who might have excused endeavors on his own behalf upon the plausible ground that he was only forwarding the avowed will of the party. The antipathy with which many persons had long

since learned to regard Burr now became the sentiment of all honest and intelligent men in the nation." Schouler, after referring to the brilliant and captivating manners of Burr, describes him as "one whose restless and romantic ambition was the more dangerous because of his utter want of conscience and generosity. He was socially well connected, and had, like Hamilton, won a fair military reputation in the war for a young officer, gaining on its close later distinction as an advocate at the New York bar, where these two were professional competitors under an act which disqualified all Tory practitioners." Hildreth designates Burr as "artful, affable, and fascinating," and he thus sums up the closing years of his life: "Arriving in New York, he found himself, in his old age, and still harassed by his creditors, obliged to resume the practice of the law for support. The death of his only daughter, lost at sea on a voyage from Charleston to meet him, left him without family ties. Yet, amid all this loneliness and embarrassment, his remarkable equanimity did not desert him, and he lived twenty-four years longer, shrouding himself with that mystery and obscurity which he so much affected, and dying at last (1836) after surviving almost all his contemporaries, at the age of eighty—a remarkable example of the mutability of political fortune." His death occurred, September 14, 1836, at Port Richmond, on Staten Island, N. Y., and his body was placed with his father's in the burying-ground at Princeton. Consult: Parton, *Life of Aaron Burr* (New York, 1858); Davis, *Memoirs of Aaron Burr* (2 vols., New York, 1836); the interesting *Private Journals of Aaron Burr during his Residence in Europe* (2 vols., New York, 1838), edited by Davis; and the brief sketch by Merwin, *Aaron Burr* (Boston, 1899), one of the "Beacon Biographies;" Adams, *History of the United States* (9 vols., New York, 1889-91), has much useful material; also Schouler, *History of the United States of America Under the Constitution* (6 vols., last edition, New York, 1899). For a strongly favorable view of Burr's life and character, consult Todd, *The True Aaron Burr* (New York, 1902), and for a bibliography virtually complete to date of publication, consult Tompkins, *Burr Bibliography* (Brooklyn, 1892).

BURR, ENOCH FITCH, D.D., LL.D. (1818—). An American Congregational divine. He was born at Westport, Conn., October 21, 1818; graduated at Yale College, 1839, and became pastor at Lyme, Conn., 1850. He lectures on the scientific evidences of religion. Of his numerous publications, all of which sold widely, may be mentioned *Ecce Calum* (1867); *Pater Mundi* (1869); *Ad Fidem* (1871); *Ecce Terra* (1884); *Celestial Empires* (1885); *Universal Beliefs* (1887); *Long Ago as Interpreted by the Nineteenth Century* (1888); *Supreme Things in their Practical Relations* (1889); besides several historical stories, e.g. *Alciph* (n.e., 1902) and *Fabius* (1897).

BURR, GEORGE LINCOLN (1857—). An American historian. He was born at Oramel, N. Y.; graduated in 1881 at Cornell, and studied at Leipzig, the Sorbonne, the Ecole des Chartes, and Zürich, in 1884-86 and 1887-88. In 1888 he was appointed professor of ancient and mediæval history at Cornell. He was historical expert for the Venezuelan boundary com-

mission in 1896-97. He is known chiefly as a student of the history of superstition. His works include *The Literature of Witchcraft* (1890) and *The Fate of Dietrich Flade* (1891).

BURR, THEODOSIA (1783-1813). The daughter of Aaron Burr, famous for her beauty, her accomplishments, and for her devotion to her father. She was born in New York City; was carefully educated by her father, showing considerable precocity, especially in linguistic studies; and after her mother's death in 1794 until 1801, was mistress of her father's household. In 1801 she married Joseph Alston, a wealthy South Carolina planter, who subsequently was elected to the Governorship of the State. She did much to arouse a feeling of sympathy for her father at the time of his trial for treason as well as thereafter. In 1812 she started from Charleston in the pilot-boat *Patriot* for New York, but the vessel was caught in a storm and was probably wrecked off Cape Hatteras, though its fate was never definitely ascertained. A tradition of uncertain origin makes the *Patriot* to have been taken by pirates and all those on board put to death.

BURR, WILLIAM HUBERT (1851—). An American civil engineer, born at Watertown, Conn. He received his education and professional training at the Rensselaer Polytechnic Institute and, after several years' engineering practice, was appointed professor of mechanics at the Institute. In 1884 he resigned the professorship to become assistant engineer to the Phoenix Bridge Company; subsequently he was appointed general manager to this company, and in 1891 was made vice-president of a company of contracting engineers. In the following year he accepted the professorship of engineering at Harvard, and early in 1893 a similar position at Columbia University, in New York. The duties of his chair, however, did not prevent him from continuing his practice of engineering, and he repeatedly rendered important services to the city of New York, as well as to the national Government. After 1893 he acted as consulting engineer to several city departments of New York, and in 1900 was awarded the first place in the competition for the proposed Memorial Bridge across the Potomac. His published works include the following: *Stresses in Bridge and Roof Trusses, Arched Ribs, and Suspension Bridges* (1879); *The Theory of the Masonry Arch* (1881); and *The Elasticity and Resistance of the Materials of Engineering* (1883).

BURRAGE, HENRY SWEETSER (1837—). An American Baptist minister and author. He was born at Fitchburg, Mass., and was educated at Brown University, Newton Theological Institution, and at the University of Halle, Germany. He served in the Thirty-sixth Massachusetts Volunteers from 1862 to 1865, and was brevetted major at the close of the war. In 1873 he became editor of *Zion's Advocate*. Besides several reviews and historical papers and his edition of the works, *Brown University in the Civil War* (1868), and *Rosier's Relation of Waymouth's Voyage* (1887), his publications include *The Act of Baptism in the History of the Christian Church* (1879); *History of the Anabaptists in Switzerland* (1883); *Baptist Hymn-Writers and Their Hymns* (1888); *History of the Baptists in New England* (1894).

BURBARD INLET. An arm of the Gulf of Georgia in southwest British Columbia. It is nine miles long; its shores, backed by the snow-capped Cascade and Olympic mountains, and covered with forests of cedars, spruces, firs, and pines, abounding in game, are a favorite resort of sportsmen. The waters of the inlet abound in unique specimens of marine biology and also afford good fishing and bathing. Vancouver, the western terminus of the Canadian Pacific Railway, is situated on its north shore.

BURBELL, DAVID JAMES (1849—). An American clergyman and author. He was born at Mount Pleasant, Pa., and graduated at Yale in 1867, and the Union Theological Seminary in 1870. After being engaged in mission work at Chicago for four years, he successively held pastorates in the Second Presbyterian Church, Dubuque, Ia. (1876-77); Westminster Church, Minneapolis (1887-91); and the Marble Collegiate Church, New York (founded in 1628, and the oldest church on the continent). The following are a few of his most important works: *The Religions of the World; Hints and Helps* (3 vols. on Bible studies); *The Gospel of Gladness; The Early Church; The Religion of the Future*.

BURRIANA, bōr-ré-ná. A town of Spain, in the Province of Castellón, about 8 miles south of the town of that name, situated in a fertile plateau on the left bank of the Rio Seco, about 1 mile from its mouth in the Mediterranean (Map: Spain, E 2). Its inhabitants are chiefly engaged in agriculture and fishing, though a considerable trade in wine, oil, and fruit is carried on. Population, in 1897, 11,700.

BURRILLVILLE. A town in Providence County, R. I., 23 miles northwest of Providence on the New York, New Haven and Hartford Railroad. It is noted principally for manufactures of woolen goods. Wallum Lake, a summer resort, popular for its fishing and fine scenery, is a noteworthy attraction of the town. The government is administered by a town council, annually elected. Population, in 1890, 5492; in 1900, 6317.

BURRITT, ELIHU (1811-79). An American philanthropist and linguist. He was born at New Britain, Conn., and first followed the occupation of blacksmith, which fact, together with his extraordinary aptitude for languages and his marvelously rapid mastery of them, gained for him the title of the 'Learned Blacksmith.' During a visit abroad in 1846-47 he was greatly touched by the suffering of the Irish peasantry in the awful famine of that year. His diary of a tour through Ireland, at this time, for the purpose of relieving the destitution and misery, is one of the most graphic and touching descriptions of human suffering ever published. In 1848 he organized the first international congress of Friends of Peace, which convened in Brussels in September of that year, and which was followed in 1849 by a second 'Peace Congress' in Paris, presided over by Victor Hugo. Burritt next lectured throughout the Union, and then returned to Europe to attend the peace congresses in Frankfurt-on-the-Main (1850), London (1851), Manchester (1852), and Edinburgh (1853). His conceptions of universal brotherhood and international arbitration received a rude shock upon the outbreak of the Crimean

and Civil wars. It has been claimed that his efforts in behalf of universal peace led to such results as the Geneva tribunal, the Washington treaty, the Paris Bering Sea tribunal, and the representations of the United States and the other Powers to Turkey regarding the troubles in Armenia. For his biography, consult Northend (New York, 1879).

BURRO, bur'ró (Sp.). The small donkey widely used as a pack-animal in Mexico and the southwestern United States. A company of them is called a burro-train.

BURROUGHS, bur'rōz, GEORGE (c.1650-92). A Colonial clergyman in America, the most prominent victim of the Salem witchcraft delusion of 1692. He graduated at Harvard in 1670, subsequently preached for several years at Falmouth (now Portland, Maine), and from 1680 to 1683 was pastor of the church at Salem Village (now Danvers), Mass. In 1685 he returned to Falmouth, but afterwards removed to Wells, where he was living at the time of the witchcraft delusion of 1692. Owing probably to the personal hostility of some of his former parishioners at Danvers, he was arrested early in 1692 on a charge of witchcraft, his indictment asserting that he, on May 9 "as well before, as after, Certaine Detestable Arts called Witchcrafts and Sorceries, Wickedly and feloniously hath Vsed, Practised, & Exercised . . . in, Vpon, & agt one Mary Walcott of Salem village by which said wicked Arts the said Mary . . . was and is Tortured, afflicted, Pined, Consumed, Wasted, and Tormented against the Peace of our Sovereigne Lord & Lady, the King and Queen." Burroughs was also charged with having likewise bewitched three other girls, and at the trial "was accused by five or six of the Bewitched as the Author of their Miseries; . . . by eight of the Confessing Witches as being an head Actor at some of Their Rendezvouses, and one who had the promise of being a King in Satan's Kingdom, now going to be Erected; by Nine Persons for extraordinary Lifting and such feats of strength, as could not be done without Diabollicall Assistance." He was finally convicted on each indictment, in spite of the report of a jury, ordered to search his body for witch marks, that "Wee find nothing upon ye body of ye Sayd burroughs but wt is naturall;" and on August 19 he was executed on Gallows Hill, Salem, making a speech on the scaffold which moved the spectators to tears and called from Cotton Mather, alarmed lest the proceedings be discontinued, the assurance that "the Devil has often been transformed into an Angel of Light." Burroughs was the only minister who lost his life during the witchcraft delusion. Consult Sprague, *Annals of the American Pulpit*, Vol. I. (New York, 1857-69); Sibley, *Graduates of Harvard University*, Vol. II. (Cambridge, 1873-85). and Upham, *Lectures on Salem Witchcraft* (Boston, 1867).

BURROUGHS, JOHN (1837—). An American essayist and critic. He was born at Roxbury, N. Y., April 3, 1837, the son of a farmer. He spent his youth between study and work in the field, and has said that his originality was fostered by growing up among people who neither read books nor cared for them. He was, however, a born author, and at fourteen began to write essays, which have remained always his favorite form of expression. His first efforts were labored

imitations of the ponderous lucubrations of Johnson; one of the first luxuries that he permitted himself having been the purchase of that author's works. A more congenial inspiration soon came to him from Emerson, whose *Essays* and *Miscellanies* he assimilated eagerly, and at nineteen he succeeded in gaining admission to *The Atlantic Monthly* with an essay on *Expressions*. After Emerson, to whom Burroughs ascribes the awakening of his religious nature and a revolution in his literary expression, the great influences in his literary life were two: Walt Whitman, who was to him a great humanizing power, and Matthew Arnold, from whom he gained clarity, alike in thought and expression. All these influences came to him in their fullness before the publication of his first book, *Walt Whitman as Poet and Person* (1867). Meantime, he had been engaged as teacher, as journalist, and as an official of the Treasury Department at Washington (1863-73). He was for some years afterwards special national bank examiner, but from 1870-74 passed most of his time on a farm in Esopus, N. Y., where he divided his time between fruit-culture and literature. Besides frequent contributions to periodicals, chiefly studies of nature and animal life, he wrote *Wake Robin* (1871); *Winter Sunshine* (1875); *Birds and Poets* (1877); *Locusts and Wild Honey* (1879); *Pepacton* (1881); *Fresh Fields* (1884); *Signs and Seasons* (1886); *Sharp Eyes* (1888); *Indoor Studies* (1889); *Riverby* (1894); *A Study* (1897); *The Light of Day* (1900); *Squirrels and Other Fur-Bearers* (1900). Burroughs's work, whether as a critic of literature, as in his works on Walt Whitman, Emerson, and Thoreau, or of religion, as in *The Light of Day*, most fully reveals the original personality of the man. They are strongly subjective, but they have found an enthusiastic response in a limited circle. In books, as in nature, it is the unconventional that appeals to him, and his own literary quality gains its fascination rather from the acuteness of his observation than from any elaboration in literary expression. He sees so clearly that he makes his reader see the individualized lives of birds, flowers, fishes, and even insects. Burroughs is a born naturalist, and his wide reading in English literature has been done with an eye to nature that gives to his similes and descriptive phrases a distinct literary flavor. Here his nearest analogue in English literature is White of Selborne. A collected edition of Burroughs's *Works* was begun in 1895.

BURROUGHS, MARIE (1866—). The stage name of Lillie Arrington, an American actress, born in San Francisco. She made her first appearance in New York, at the Madison Square Theatre, in the part of Gladys in *The Rajah*. Other early successes were won in *Alpine Roses*; *Partners*; and *Saints and Sinners*. Afterwards she appeared for several seasons with E. S. Willard (q.v.), in such plays as *The Middleman* and *Judah*, and as Ophelia (1894). In 1894 she began starring in *The Profligate* and other pieces. Later she played in *The Gadfly* with Stuart Robson, and in *The Meddler*. In 1900 she appeared as Guida Landresse in *The Battle of the Strong*. Miss Burroughs is the wife of Robert Barclay MacPherson, her second husband, to whom she was married in 1901. Consult Strang, *Famous Actresses of the Day in America* (Boston, 1899).

BURROWING BEE. Any of several kinds of bees that form burrows in the ground as nesting-places. Prominent among them are the genera *Andrena* and *Haliectus*. See **BEE**; **BUMBLEBEE**; and **Plate of WILD BEES**.

BURROWING OWL, or **COQUIMBO**. A small owl (*Speotyto cucularia*), that dwells in the abandoned burrows of various fossorial quadrupeds. It abounds on the open plains of both North and South America, those of South America constituting a well-marked geographical race; races also dwell scantily in Florida, and the islands of Bahama and Guadalupe. They are of small size, about $9\frac{1}{2}$ inches long, and have very long legs, scantily feathered; the tail is very short, there are no ear-tufts, and the sexes are alike in size and color, which is brownish above and buffy below, variously barred and spotted with somewhat darker tints. The South American race (called 'coquimbo') inhabits old burrows of the vizacha, the Patagonian cavy, or even of armadillos and large lizards, and it is "generally believed that when they do not find suitable accommodations of this kind they dig holes for themselves." This race differs from the North American bird, which is diurnal, in being "crepuscular or nocturnal, . . . seldom feeding at all until toward sunset, when it becomes very active. On the pampas it is usually very tame, . . . but after sunset it becomes very vigilant, flying up and hovering at a height of 30 or 40 feet, and uttering its screams of protest whenever an intruder appears in sight, thus giving ample warning to its neighbors, the vizachas" (*Stejneger*). The North American burrowing owls have been very thoroughly described by Dr. Elliot Coues in his *Birds of the Northwest*, from which the following is quoted:

"The burrowing owl is the only bird of its family inhabiting, in any numbers, the entirely treeless regions of the West, and may be considered characteristic of the plains. Wherever it can find shelter in the holes of such animals as wolves, foxes, and badgers, and especially of the various species of marmot squirrels, there it is found in abundance; and in not a few instances small colonies are observed living apart from their ordinary associates, in holes apparently dug by themselves. They constitute a notable exception to the general rule of arboricole habits in this family, being specially fitted by their conformation for the subterranean mode of life for which they are designed, and are furthermore exceptional in their gregarious disposition, here carried to the extreme. The diffusion of the species in the West is so general that there is little occasion to mention particular localities.

"The notes of the burrowing owl are peculiar. The birds do not 'hoot,' nor is there anything lugubrious or foreboding in their cry. Sometimes they chuckle, chatter, and squeal in an odd way, as if they had caught a habit of barking from the 'dogs' they live with, and were trying to imitate the sound. But their natural cry is curiously similar to that of the rain-crow, or cuckoo of America—so much so that more than one observer has been deceived. They scream hoarsely when wounded and caught, though this is but seldom, since, if any life remains, they scramble quickly into a hole and are not easy to recover. The flight is perfectly

noiseless, like that of other owls, owing to the peculiar downy texture of the plumage. By day they seldom fly far from the entrance of their burrow, and rarely, if ever, mount in the air. I never saw one on wing more than a few moments at a time, just long enough for it to pass from one hillock to another, as it does by skimming low over the surface of the ground in a rapid, easy, and rather graceful manner. They live chiefly upon insects, especially grasshoppers; they also feed upon lizards, as I once determined by dissection, and there is no doubt that young prairie-dogs furnish them many a meal. Under ordinary circumstances they are not very shy or difficult to procure; I once secured several specimens in a few minutes, and I fear, left some others to languish and die in their holes. As commonly observed, perched on one of the innumerable little eminences that mark a dog-town, amid their curious surroundings, they present a spectacle not easily forgotten. Their figure is peculiar, with their long legs and short tail; the element of the grotesque is never wanting; it is hard to say whether they look most ludicrous as they stand stiffly erect and motionless, or when they suddenly turn tail to duck into the hole, or when engaged in their various antics."

Their nests are made of soft materials in this underground chamber, and contain seven or eight white eggs. They remain throughout the winter in and about their holes, though some may migrate from the most northerly and inclement part of their range. The story that they hibernate is fictitious. It is scarcely necessary also to refute at length, as does Dr. Coues, the fable that they live harmoniously—a sort of happy family—with the prairie-dogs and prevalent rattlesnakes. They are unwelcome neighbors to (not co-tenants with) the squirrels, and the rattlesnakes enter the burrows as enemies to both. See **OWL**; and **Plate of OWLS**.

BURROWING PERCH. See **CULPER**.

BURROWS, WILLIAM (1785-1813). An American naval officer. He was born near Philadelphia, entered the United States Navy as a midshipman in 1799, and served as an acting lieutenant in the Tripolitan War. In the war with England he commanded the *Enterprise* in the engagement with the *Boxer* off Portland, Maine, on September 5, 1813. The *Boxer* was taken; but Burrows was mortally wounded, and lived only long enough to receive the surrender of Capt. Samuel Blythe, the English commander, who was also killed. The bodies of the two officers were buried side by side in Portland.

BURRSTONE. See **BUHRSTONE**.

BURSAR, **BURSARY**, or **BURSE** (*Burse* is a doublet of *purse*, Fr. *bourse*, pouch, from Low Lat. *bursa*, purse, Gk. *βίρα*, *byra*, hide, skin). In the universities of Great Britain, especially in those of Scotland, and in early New England usage, the term bursar was not restricted to the keeper of a burse or purse—the treasurer—but it might mean, and often did mean, the recipient of a burse, or bursary, or, as we should say, the holder of a scholarship. The conditions under which these bursaries have been bestowed vary in different places. In Scotland the number of bursaries or foundations for the encouragement of students has been very

large, and in recent years there has been a great deal of discussion of their influence—whether or not the conditions under which they have been awarded are as favorable as they might be to the promotion of learning. In a monastery the bursar would be the one who held and disbursed the income. In this sense the office is still maintained in Harvard University, where the bursar is a sort of sub-treasurer, charged with certain intramural duties, under the direction of the treasurer.

BURSCHENSCHAFT, böör'shen-shäft (Ger. *Bursche*, fellow, apprentice, student, from MHG. *burse*, purse; society, especially of students, with a common purse). An association of students in the German universities to promote patriotism, morality, and love of liberty. The earliest organization was at Jena in 1815, and its membership was chiefly made up of students who had fought in the War of Liberation. The idea spread to Tübingen, Heidelberg, Halle, and Giessen. In 1817, the occasion of the three hundredth anniversary of Luther's initiation of the Reformation, a general gathering took place at the Wartburg, and the following year a constitution was adopted by delegates from fourteen universities. Black, red, and gold, since taken as the national colors of the new German Empire, were adopted as the colors of the association. The murder of Kotzebue by Sand, a fanatical student, in 1819, injured the movement for freedom in Germany and led to repressive measures, such as the Karlsbad Decrees (q.v.), which required the suppression of the Burschenschaft, but secret meetings were still held, and there was a revival of the organization in 1827. The Burschenschaft participated in the Liberal demonstration known as the Hambach Festival in 1832. A revolutionary attempt took place at Frankfort-on-the-Main in 1833, in which nearly 2000 students were implicated, and in nearly all of the German universities students were arrested, imprisoned, and disfranchised. The ideals of the Burschenschaft were unattainable and vague; but they served well at a trying time to keep alive the spirit of German unity.

BURSERACEÆ (Neo-Lat. *Bursera*, from Joachim Burser, a German botanist). An order of dicotyledonous plants with 13 genera and more than 300 species, most of which occur in the tropics of both hemispheres, although a single species of *Bursera* is found in Florida. The species of this family are trees and shrubs with alternate—mostly compound—dotted leaves. The entire order is noted for the balsams and resins obtained from its representatives. The flowers are generally small, 4-5 parted, carpels 3-5, with usually 2 ovules in each. The fruit is a drupe or a capsule. The chief genera are *Commiphora*, *Bursera*, *Boswellia*, *Canarium*, and *Protium*. For some of their products see **ELEMI**; **MYRRH**; **BALSAM**; **BDELIIUM**; **OLIBANUM**; **FRANKINCENSE**, etc.

BURSIAN, böör'sé-an, KONRAD (1830-83). A German archæologist and classical philologist. He was born at Mutzschen, in Saxony, was educated in Leipzig, and held professorships in the universities of Leipzig, Tübingen, Zurich, Jena, and Munich. His chief works are *Geographie von Griechenland* (1862-72), and *Geschichte der klassischen Philologie in Deutschland* (1883). He also founded (1873) and edited the *Jahres-*

bericht über die Fortschritte der klassischen Alterthums-wissenschaft.

BURSRLEM (*Burcard's dwelling on the loam*, AS. *lām*, Ger. *Lehm*, clay). A town of Staffordshire, England, on the Trent and Mersey Canal, about 20 miles north-northwest of Stafford. It is in the pottery district (Map: England, D 3). Its two principal buildings are the Wedgwood Memorial Institute, opened in 1870, and containing an art school, a library, and a museum; and a fine town hall, erected in 1865. The town was incorporated in 1878. The abundance of coal and the variety of clays have made Burslem, since the Seventeenth Century, one of the chief seats of the fictile manufacture. Porcelain and pottery of all kinds—Parian, iron, and stone ware, etc.—are produced on a large scale, as well as encaustic tiles. There is also a glass manufactory here. The town's sewage is disposed of by irrigation and the refuse by a destructor. It owns its gas-works, on which it makes a small annual profit; and its markets, which net about \$5000 annually. There are public baths. At Birche's Head, a mile and a half from Burslem, stands a large service reservoir of the Staffordshire Waterworks Company, from which the town and neighborhood are supplied with excellent water. Population, in 1891, 32,000; in 1901, 38,800. Burslem was the native place of Josiah Wedgwood (q.v.).

BURT, WILLIAM A. (1792-1858). An American surveyor. He was born in Worcester, Mass., but in 1824 settled near Detroit, Mich. He became United States deputy surveyor in 1833, and in this capacity surveyed nearly the whole of northern Michigan (1840-47). He invented the solar compass, and in 1851 received the prize medal for it at the London Industrial Exhibition. He was judge of the Michigan Circuit Court, and as a member of the Legislature in 1852 was prime mover in the construction of the Sault Ste. Marie Canal.

BURTON (origin doubtful). A tackle used for special purposes. In rigged ships *top burtons* are hooked to burton pendants hanging from the topmast-head. They are also used as additional supports to yards when the latter are rigged for hoisting heavy weights and for other similar purposes. A *sail-burton* is a tackle for hoisting sails up to the yards for bending; the chief peculiarity is a runner, or guide-block, which is lashed to the lower block of the purchase and travels on the hauling part, thus preventing the tackle from twisting and the sail from swaying about as it goes aloft. See **TACKLE**.

BURTON, JOHN HILL (1809-81). A Scotch jurist, historian, and encyclopædist, born in Aberdeen, August 22, 1809. He graduated at Marischal College, Aberdeen, studied law, and was admitted to the Edinburgh bar, but supported himself chiefly by literature. From 1833 he contributed articles on law, history, and political economy to the *Westminster Review*, literary sketches to *Blackwood's Magazine*, and also wrote for the *Cyclopædia of Universal Biography*, *Waterson's Cyclopædia of Commerce*, and *Chambers's Encyclopædia*. In 1854 he was relieved from monetary precariousness by a governmental appointment. His most important original work is *The History of Scotland, from Agricola's Invasion to the Revolution of 1688* (7 vols., 1867-70). A new edition, enlarged and

partly rewritten, appeared in 8 vols., 1873. In 1879 he published a *History of the Reign of Queen Anne*. The merits of Burton's historical works are universally admitted. He held the ancient office of historiographer royal for Scotland, was LL.D. of Edinburgh University, and D.C.L. of Oxford. He died near Edinburgh, August 10, 1881. Consult: "Memoir of Burton," in *Blackwood's Magazine* (September, 1881); and a *Memoir* by his wife, prefixed to *The Book Hunter* (New York, 1863).

BURTON, RICHARD (1859—). An American poet. He was born in Hartford, Conn., March 14, 1859. He was graduated at Trinity College (1883) and Johns Hopkins (1887); was managing editor of *The Churchman* (1889-90); literary editor of the *Hartford Courant* (1890-97), and professor of English literature in the University of Minnesota (1893-1902), and afterwards literary adviser of D. Lothrop & Co. His poems are collected in *Dumb in June* (1895); *Memorial Day* (1897); and *Lyrics of Brotherhood* (1899). He published also *Dogs and Dog Literature*, *Literary Likings* (1898), *John Greenleaf Whittier* (1901), and *Forces in Fiction* (1902).

BURTON, Sir RICHARD FRANCIS (1821-90). A British traveler and author, born in Hertfordshire, England, March 19, 1821. In 1842 he entered the Indian Army, and served many years in Sindh. In 1851 he published his first important work—*Sind, and the Races that Inhabit the Valley of the Indus*, full of graphic description, and interesting to all readers. Burton acquired a very familiar acquaintance with Hindustani, Persian, and Multani, and learned to speak Arabic like a native. Thus equipped, he resolved to explore Arabia in the disguise of an Afghan pilgrim. Political commotions prevented him from traversing the whole country, as he intended; but his *Personal Narrative of a Pilgrimage to El Medinah and Meccah* (1855) records an extraordinarily daring feat. His next journey was into the country of the Somalis, in Eastern Africa. His companion, Lieutenant Stroyan, was killed and he himself was wounded. He succeeded, however, in reaching Harrar, a town not before visited by any European, and in penetrating a vast and populous region scarcely known to geographers. Toward the end of 1856 he set out, in company with Lieutenant Speke, also of the Indian Army, to ascertain the truth of the reports collected by the missionaries that a vast lake existed in the heart of Africa. The journey led to the discovery in 1858 of the great lake of Tanganyika (followed by the discovery of the Victoria Nyanza by Speke) and the opening up of the eastern part of the continent. In 1861 Burton was appointed consul at Fernando Po, on the west coast of Africa, and while holding this appointment he visited the Kamerun Mountains, and went on a mission to the King of Dahomey, the incidents of both journeys being recorded in two of his most interesting works. He was subsequently consul at Santos in Brazil and at Damascus, and on the death of Charles Lever, in 1872, he succeeded to the post of British consul at Trieste. He died October 20, 1890. Among his many works are the following: *Sind; or, the Unhappy Valley* (1851); *Goa and the Blue Mountains* (1851); *Falconry in the Valley of the Indus* (1852); *First Footsteps in East Africa*

(1856); *The Lake Regions of Equatorial Africa* (1860); *The City of the Saints* (1861); *Abookuta; or, the Cameroon Mountains* (1863); *The Nile Basin* (1864); *A Mission to Gobi, King of Dahomey* (1864); *Explorations in the Highlands of Brazil* (1869); *Vikram and the Vampire* (1870); *Zanzibar* (1872); *Gonik Land* (1875); *Ultima Thule; or, a Summer in Iceland* (1875); *Etruscan Bologna* (1876); *Sind Revisited* (1877); *The Gold Mines of Midian and the Ruined Midianite Cities* (1878). In 1885-88 he published, with a remarkable introduction and valuable notes, a literal translation of the *Arabian Nights* under the title of *The Thousand Nights and a Night* (10 vols. and 6 vols. of supplement), of which his wife issued an expurgated edition in 6 vols. (1870). In 1894 appeared the Library edition, 12 vols., an abridgment of the original publication. He left a manuscript to his widow, Lady Isabel Burton, consisting of a translation, with original notes, from the Arabic of *The Scented Garden*, which she destroyed as a moral act, though it was deemed of great importance by scholars, and had been valued at \$30,000. A literal translation of the *Pentamerone* by Burton was published posthumously (1893). To Burton we are also indebted for the best English translation of the *Lusiads* and the lyrics of Camoens (1881-84). For his life, consult: Hitchman (London, 1887); Lady Burton (New York, 1893); and Stisted (New York, 1897); also Lady Burton and W. H. Wilkins, *The Romance of Isabel, Lady Burton* (New York, 1897).

BURTON, ROBERT (1577-1640). The author of the *Anatomy of Melancholy*. He was born at Lindley, in Leicestershire, February 8, 1577, and was educated at Brasenose and Christ Church, Oxford. In 1616 he was appointed to the vicarage of Saint Thomas, in the west suburbs of Oxford; and about 1630 to the rectory of Segrave in his native county. Though he officiated at Saint Thomas for a time, he passed his life almost wholly at Christ Church, where he died January 25, 1640, at or near the time he had foretold by the calculation of his horoscope. To the Bodleian Library he left his rare collection of books. His brother erected a monument to his memory in the Cathedral of Christ Church. Anthony Wood, in the *Athenæ*, thus wrote of him: "He was an exact mathematician, a curious calculator of nativities, a general read scholar, a thorough-paced philologist, and one that understood the surveying of lands well. As he was by many accounted a severe student, a devourer of authors, a melancholy and humorous person, so by others who knew him well, a person of great honesty, plain-dealing, and charity. I have heard some of the antients of Christ Church often say that his company was very merry, facetious, and juvenile." *The Anatomy* was first published in 1621. Burton was constantly revising his work, of which four more editions appeared during his life. After his death the final version was printed from his annotated copy (1651-52). Burton dedicated himself to melancholy, analyzing its various manifestations after the formal manner of treatises on divinity. His book is one of the most curious and interesting in the whole realm of literature. Dr. Johnson said that it "was the only book that ever took him out of bed two hours sooner than he wished to rise." Milton read it, deriving hints for *Il*

Penseroso; Sterne pillaged it; Lamb admired it and imitated its quaint style. Consult: *The Anatomy*, edited by Shilleto, with introduction by Bullen (London and New York, 1893).

BURTON, WILLIAM EVANS (1804-60). An English actor and playwright, born in London, a son of William George Burton, author of *Biblical Researches*. He was intended for the Church, and received a classical education, but at eighteen took charge of his father's printing establishment and edited a magazine. From amateur acting he drifted toward the regular stage, and made a successful début at the Haymarket in 1832. He began also to write dramas, one of which was played simultaneously at five London theatres. In 1834 he came to the United States, where he was prominent as actor or manager, chiefly in Baltimore, Philadelphia, and New York. In Philadelphia he established the *Gentleman's Magazine*, a literary monthly. His greatest success was in the management of the Chambers Street Theatre, in New York City, where, with Brougham and others, he produced dramas from several of Dickens's novels. His own forte was low comedy, and some of his characters were very popular. Such were *Captain Cuttle*, *Toodles*, *Micawber*, *Aminadab Sleek*, *Paul Pry*, and others. He was a fine scholar, and had a superior library, particularly of Shakespearean literature. He was for several years the editor of the *Literary Souvenir*, and published in two volumes a *Cyclopædia of Wit and Humor*.

BURTON JUNIOR. The *nom de plume* under which Charles Lamb wrote "On the Melancholy of Tailors," in Leigh Hunt's *Magazine*, *The Reflector* (1810).

BURTON-UPON-TRENT. A town in Staffordshire, England, about 11 miles southwest of Derby, on the river Trent and the Trent and Mersey Canal (Map: England, E 4). A bridge of 34 arches, built before the Norman Conquest, crossed the river here, but was replaced in 1864 by a new one of 29 arches. Burton-upon-Trent at one time was quite celebrated for its cotton-mills, but this industry has been entirely superseded by that of ale-brewing. There are over thirty breweries in Burton, some of them on a scale of unparalleled magnitude. The two establishments of Bass and Allsopp cover together more than 250 acres of ground, and can produce yearly about 2,000,000 barrels of ale. The town was incorporated in 1878. Its water-works are in the hands of a private company. Its sewage is disposed of by irrigation. The town has owned its gas-works since 1876, and makes an annual profit of about \$30,000. It has also operated an electric-light plant since 1894 at a considerable profit. It maintains public baths, markets, a cemetery, and a library. The increase of the population since 1870, when it was about 20,000, has been very rapid. In 1891 it was 46,000, and in 1901, 50,400. The town dates from the end of the Ninth Century, when it grew up around an abbey founded at that time. It suffered severely during the civil wars in the Seventeenth Century.

BURTSCHIED, böört'shīt (Lat. *Porcetum*, Fr. *Rourcette*). A southern suburb of Aix-la-Chapelle (q.v.), formerly an independent municipality in the Rhine Province, Germany. It is noted for its numerous thermal springs and

manufactures of iron, steel, needles, and woolen goods. Population, in 1895, 15,871.

BURTSELL, RICHARD LALOR (1840-1902). An American Roman Catholic priest. He was born in New York, April 14, 1840. He pursued his studies at the Propaganda in Rome, taking his degree there, and receiving his ordination in 1862. Returning to New York, he was appointed assistant pastor of Saint Anne's Church, and in 1868 assigned to the new parish of the Epiphany. He was the first incumbent in the office of "Defender of the Marriage Tie" (q.v.), instituted in America by the Third Plenary Council of the Catholic Church, held in Baltimore in 1884. In 1887 he identified himself with a movement in which the Rev. Dr. McGlynn (q.v.) was concerned, and was counsel and adviser to Dr. McGlynn after his suspension from priestly functions. This involved him in personal trouble. He was removed from the office of "Defender of the Marriage Tie" in 1887; official notice of his action was taken in 1889; and he was ordered to retire from his position as pastor of the Church of the Epiphany to a small parish in Rondout, N. Y. He appealed from the order of the Archbishop to the Propaganda at Rome, and by that body was ordered to make his submission to the Archbishop. He preached his farewell sermon to his congregation in July, 1890; appealed to Rome for reinstatement, and was refused in 1896.

BURU, bū'rōō, **BOEROE**, or **BOORO**. An island of the Molucca group of the Dutch East Indies, situated about 40 miles west of Amboyna and Ceram, from which it is separated by Buru Strait. It lies between latitudes 3° and 4° S., and longitudes 126° and 127° 20' E. (Map: Islands of the Pacific, E 3). Its length is about 90 miles, and its area about 3380 square miles. It is very mountainous, especially in the western part, Mount Tumaha rising to 8530 feet, and is thickly wooded. The population is estimated at 60,000; the chief town is Cajeli, on the eastern coast. Administratively it is a dependency of Amboyna.

BURUJIRD, bū'rōō-jērd'. A town in the Province of Irak-Ajemi, Persia, situated in a fertile valley about 190 miles northwest of Ispahan. It has a castle and several mosques, and some manufactures of cotton goods and felt. It has a trade in skins with Russia and is connected by roads with Ispahan and Hamadan. Population, about 20,000.

BURUNDUK, bū'rūn-dōōk' (Russ., a species of squirrel). A striped ground-squirrel (*Tamias Asiaticus*) of northern Asia and Europe, closely resembling in appearance and habits the American chipmunks.

BURY, bēr'ī (AS. *burh*, fort, borough). A flourishing manufacturing town in the southeast of Lancashire, England, on rising ground, backed by hills on the north and east, and on the Irwell, 8 miles northwest of Manchester (Map: England, D 3). Bury obtained a charter of incorporation in 1876. The town's affairs are administered by a mayor, a municipal council of 29, and a board of aldermen of 10 members. (See GREAT BRITAIN, *Local Government*.) The town has an excellent water-supply with a daily output of nearly 7,000,000 gallons; modern sewage-works, and has owned and operated gas-works since 1858, and an electric-light plant since 1896.

Among other municipal undertakings are public baths, opened in 1864, markets, and an infectious diseases hospital. Bury was early a seat of the woolen manufactures, carried on by Flemings; but these, though still considerable, now yield in importance to those of cotton. Besides spinning and weaving factories, there are important print, bleach, paper, and dye-works, and some large foundries and engine manufactories. In the vicinity are excellent freestone-quarries, and abundant coal-mines. Population, in 1891, 57,262; in 1901, 58,028.

BURY, bú'ri, JOHN B. (1861—). An Irish scholar. He was educated at Trinity College, Dublin, of which he became fellow and tutor in 1885. In 1893 he was appointed professor of modern history in Dublin University. In 1898 he was transferred to the chair of Greek. He edited the *Nemean Odes of Pindar* (1890), the *Isthmian Odes* (1892), *Freeman's History of Federal Government in Greece and Italy* (1893), and *Gibbon's Decline and Fall* (1896-99). His other publications include a *History of the Later Roman Empire from Arcadius to Irene* (1889) and a *Student's History of the Roman Empire from Augustus to Marcus Aurelius* (1893).

BURY, RICHARD DE (1281-1345). An English prelate, so called from his birthplace, Bury Saint Edmunds; his real name was Aungerville. He was educated at Oxford and became a Benedictine monk at Durham; was tutor to Edward III.; was appointed Dean of Wells in 1353, and in the same year was sent on a mission to the Pope, who made him Bishop of Durham. He held the office of High Chancellor (1334-35), and then became one of the King's ambassadors in foreign countries. He was noted for his beneficence, and founded a large library in connection with Durham College, Oxford (afterwards suppressed). His chief work, *Philobiblon* (English version, London, 1834), describes his manner of collecting books, and gives an account of the state of learning in England and France. He was a friend of Petrarch at Avignon.

BURY (bûr'i) FAIB. The title of a play following the lines of Molière's *Précieuses ridicules*, by Thomas Shadwell (1690).

BURYING BEETLE. The largest of the carrion-beetles, Silphidae, belonging to the genus *Necrophorus* (Gk. *νεκρός*, dead + *φέρω*, carry). The name burying or sexton beetles has been given them on account of their habit of burying the dead bodies of small vertebrates as a nidus for their eggs and food for the young. This they accomplish by digging away the earth beneath the body until the latter sinks below the surface of the ground. The excavated soil is then heaped over the body, after which the female burrows down to it and deposits her eggs in it, and when the larvæ hatch they feed on the carcass. The largest North American species is *Necrophorus Americanus*, 1½ inches long. It is a black beetle with a red head and two red spots on the elytra. A smaller form is common in the eastern United States. See colored Plate of BEETLES.

BURY SAINT EDMUNDS, or SAINT EDMUNDSBURY (borough in memory of Saint Edmund, the martyr). A market town and ancient borough in Suffolkshire, England, on the Lark, 26 miles northwest of Ipswich (Map: England, G 4). It is well built and delightfully situated. The chief commercial interest of the

town is in the corn and cattle markets held there. The town abounds in historical remains, the more important of which are: the ruins of the famous Benedictine abbey, consisting of a western gate, a handsome specimen of decorated Gothic, and the tower or church-gate, a fine example of massive Norman; and the Gothic churches of Saint James and Saint Mary, the latter containing the tomb of Mary Tudor, daughter of Henry VII. of England and wife of Louis XII. of France. The town sends one member to Parliament. It owns its water-works, and maintains public baths, markets, a hospital, and a school of art. Population, in 1891, 16,630; in 1901, 16,255.

Bury Saint Edmunds, originally Beodricsweorthe, received its name from Edmund, the Saxon King and martyr, who was killed here in 870 by the Danes, and whose tomb became a noted shrine of pilgrimage. Here Canute raised a Benedictine abbey, which after Glastonbury became the richest and most important in England. Between the abbots and the townspeople frequent battles occurred. From 1020 to its dissolution by Henry VIII., it was ruled over by a line of 33 abbots. Consult Hill, "Antiquities of Bury Saint Edmund," in *Archæological Journal*, Vol. XXI. (London, 1865).

BUSACO, bú-sá'kô. A ridge on the north side of the River Mondego, in the Province of Beira, Portugal, about 20 miles north-northeast of Coimbra. Here Wellington, with about 40,000 British and Portuguese troops, repulsed the attack of Masséna with 65,000 French, September 27, 1810. Unable to force the position, Masséna turned it by passing over an adjoining ridge, and Wellington retired behind the lines of Torres Vedras.

BUSBECC, bú'sbék', **BUSBEC**, or **BUSBEK**, AUGIER GHISLAIN DE (Latinized Busbequius) (1522-92). A Flemish diplomat and scholar, born at Comines. He received the best university training of his day at Louvain, Paris, and various Italian universities, and entered the service of Ferdinand, King of the Romans, whose ambassador he accompanied to England in 1554. From London he was sent to the Turkish Court, where for eight years he rendered important diplomatic services. In 1562, however, he was recalled to become tutor and guardian to the sons of Maximilian II., and from 1570 he held the post of master of ceremonies to the Archduchess Elizabeth, widow of Charles IX. of France. He was also employed by the Emperor Rudolph II. as ambassador at Paris. On quitting this post in 1592, Busbecq set out for Flanders, but died on the way at the castle of Maillot, near Rouen, October 28, 1592. Busbecq's most important work is his volume of letters from Turkey—*Legationis Turcicæ epistolæ quatuor* (Paris, 1589)—a scholarly study of the Ottoman power. His *Epistolæ ad Rodolphum II. Imperatorem, e Galia scriptæ* (Brussels, 1631), contains much interesting information on contemporary French history. His other works have been lost. A collected edition of his extant works appeared at Leyden (1633), and another at Basel (1740). He has been frequently translated into French, German, and English. His Latin style is pure, elegant, and simple. Busbecq was a great collector of manuscripts, and gave over one hundred to the library at Vienna. He was also a botanist and introduced the horse-chestnut tree into

Europe. Consult: Forster and Daniell, *The Life and Letters of Ogier Ghiselin de Busbecq* (London, 1881), which contains his most important writings; also, De Thou, *Histoire de mon temps* (Paris, 1604); Saint-Genois, *Les voyageurs belges* (Brussels, 1847); Dupuis, "Etude sur l'ambassade d'Augier de Busbecques en Turquie," in *Mémoires de la Société des Sciences de Lille*.

BUSBY, bûz'bi (probably from a proper name). The full dress or 'review' uniform head-gear of different branches of the British Army. In the Hussar Cavalry and Royal Horse Artillery the busby is of fur, with a cloth top, from which is suspended on the right side a cloth bag, known as the busby-bag, which is of the same color as the facings of the regiment, as is also the tuft or plume worn on the top front of the busby. The massive busby worn by the Foot Guards is made of expensive bearskin over a skeleton framework, and in the case of commissioned officers surmounted by a lofty white plume. The Highland regiments wear a busby after much the same pattern as the Foot Guards, but of somewhat smaller proportions and far less intrinsic value. The Rifle Brigade wear a busby of modified shape, made of astrakhan with a small stiff plume in front. In the case of the Guards, Highlanders, and Rifle Brigade, the busby is without bag or busby-cords. The busby, like the brilliant uniform of which it forms a part, is worn only in times of peace. On active service it is superseded by the helmet and 'puggaree.'

BUSBY, RICHARD (1606-95). A noted English schoolmaster. He was born in Lutton (or Sutton), Lincolnshire; was educated at Westminster School and at Oxford, and in 1638 received the provisional appointment of headmaster of Westminster School, the duties of which office he continued to discharge until his death. As a pedagogue he was conspicuous alike for learning, assiduity, and the application of the birch. He was a most successful teacher, and at one time could point to no less than sixteen occupants of the bench of bishops who had been educated in his school. Altogether, he has the reputation of having 'bred up the greatest number of learned scholars that ever adorned any age or nation.' Dryden, Locke, and Robert South were among his pupils. Dr. Busby published several works, but they were chiefly expurgated editions of the classics for school use.

BUSCH, bûsh, MORITZ (1821-99). A German publicist. He was born in Dresden, studied theology and philosophy in Leipzig, and began literary life as a translator of Dickens, Thackeray, and other English authors. In 1851 he visited the United States, and on his return published *Wanderungen zwischen Hudson und Mississippi* (1853) and *Die Mormonen* (1857). He then engaged in newspaper work, and attracted Bismarck's attention by his articles in the *Grenzboten*. On April 1, 1870, he received an appointment in the German Foreign Office, but his real function was that of a reporter for the press to Prince Bismarck. From that time and for many years he was the inseparable companion and confidant of the Chancellor, taking daily notes of his sayings and doings, and earning for himself the title of 'Bismarck's Boswell.' In 1878 he published a part of his diary, kept during the Franco-Prussian War, under the title of *Graf Bismarck und seine Leute während des Kriegs mit Frankreich*; this was published also

in English in 1879. In 1884 he published the life of his hero, which was soon issued in an English translation under the title *Our Chancellor*. Two months after the death of Bismarck Dr. Busch published a large work, which was immediately translated into English under the title *Bismarck: Some Secret Pages of His History* (1898).

BUSCH, WILHELM (1826-81). A German surgeon, born in Marburg. He studied at the University of Berlin; was in 1855 appointed professor of surgery at Bonn, and afterwards acted as consulting surgeon-general in the army in 1866 and during the Franco-Prussian War. His published works include the following: *Chirurgische Beobachtungen, gesammelt in der Klinik zu Berlin* (1854); *Lehrbuch der Chirurgie* (2 vols., 1857-69).

BUSCH, WILHELM (1832—). A German humorous artist and rhymester, born at Wiedensahl, Hanover. He began to draw for the *Fliegende Blätter* in 1859. His earlier manner displayed satirical skill and much facility in characterization by slight outline strokes, but his later work lacks form and finish. He published a series of sketches, for which he himself composed suitable text, and which have become exceedingly popular throughout Germany. This includes *Max und Moritz*; *Hans Hucklebein, der Unglücksarabe*; *Der heilige Antonius von Padua*; *Die fromme Helene*; and *Pater Filucius*.

BUSCHE, bû'she, HERMANN von dem (1468-1534). A German scholar, born at Sassenberg, in Westphalia. He studied at Heidelberg, at Tübingen, and in Italy, where he became versed in Latin, and after his return to Germany traveled about from one university centre to another, lecturing on the classic literature and antiquities. He is said to have written some of the *Epistolæ Obscurorum Virorum*. At all events, he joined the leaders of the Reformation, was a friend of Ulrich von Hutten, and in 1527 was appointed first professor of classical literature at the University of Marburg, founded in that year by Landgrave Philip the Magnanimous. He wrote three books of epigrams, a defense of humanistic studies entitled *Vallum Humanitatis* (1518), and other works. Consult Liessem, *Leben und Schriften* (Cologne, 1884-89), which contains a bibliography.

BÜSCHING, bû'shîng, ANTON FRIEDRICH (1724-93). A German geographer. He was born in Stadthagen, in Schaumburg-Lippe, and studied theology at Halle, where he enjoyed the friendship of Baumgarten. In 1754 he was appointed professor of philosophy in Göttingen, but in 1761 accepted an invitation to Saint Petersburg as preacher to a Protestant congregation there. In 1766 he was called to Berlin as superior consistorial councilor and director of a gymnasium, and died there. Until the appearance of Büsching's *Neue Erdbeschreibung* (11 vols., 1754-92), neither Germany nor any other nation possessed a geographical work which made any pretension to scientific treatment or completeness of execution. Political changes have deprived the work of its original value, but it has been corrected and edited by subsequent writers. Of his other numerous publications, the most important is the *Magazin für Historiographie und Geographie* (25 vols., 1767-93).

BÜSCHING, JOHANN GUSTAV GOTTLIEB (1783-1829). A German antiquary, son of the preceding, born in Berlin. He studied at Erlangen and Halle, was appointed royal archivist at Breslau in 1811, and in 1817 professor of archaeology in the University there. His knowledge of subjects appertaining to the Germany of the Middle Ages was remarkable. His works include a *Sammlung deutscher Lieder*, with musical accompaniments (1807); *Deutsche Gedichte des Mittelalters* (3 parts, 1808-25); and *Des Deutschen Leben, Kunst, und Wissen in Mittelalter* (4 vols., 1816-18).

BUSCHMANN, bush'mán, JOHANN KARL EDUARD (1805-80). A German philologist, born at Magdeburg. He studied at the universities of Berlin and Göttingen, and collaborated with the brothers von Humboldt in the preparation of their works, particularly with Alexander in the *Kosmos* (1845-58). His researches in comparative philology were very important. They were directed chiefly toward the dialects of Malaysia and Polynesia, and those of central and north-western America. Many of the results of this work are to be found in the *Kaurisprache auf der Insel Java* (3 vols., 1836-39) of W. von Humboldt, which, after Humboldt's death, Buschmann completed and edited for the press. His own publications include *Aperçu de la langue des Iles Marquises et de la langue taitienne* (1843); *Ueber die aztekischen Ortsnamen* (1853); *Die Spuren der aztekischen Sprache im nördlichen Mexiko* (1859); and *Grammatik der sonorisichen Sprachen* (3 parts, 1864-69).

BUSENBAUM, bōō'zen-boum, HERMANN (1600-68). A German Jesuit, known as a casuist. He was born at Notteln, in Westphalia, and entered the Jesuit order in 1619, taught scholastic and moral theology in Cologne, and was rector successively of Jesuit colleges in Hildesheim and Münster. In 1645 he published his *Medulla Theologiæ Moralis, Facili ac Perspicua Methodo Resolvens Casus Conscientiæ*, in seven books. This work passed through forty-five editions between 1645 and 1670, and has since been frequently reprinted. It met no considerable opposition until it appeared in 1729 in Lyons and in 1716-33 in Cologne, edited by Lacroix, with a commentary and supplementary material from other casuists. Its teachings concerning murder, and particularly regicide, were emphasized through the attempted assassination of Louis XV. of France by Damiens in 1757. It was publicly condemned by the Parliament of Paris, and burned by that of Toulouse. Although less bold in its declarations than some other Jesuit books, such as, for example, the *Defensio Fidei* (1613) of Francisco Suárez, it was the most complete and systematized in its exposition, and served as a type for succeeding treatises of the sort.

BUSENTO, bōō-sen'tō (anciently, Lat. *Bucentius*). A small stream in South Italy, which flows into the Crati at Cosenza (q.v.), and in the bed of which Alaric (q.v.) is said to have been buried, the stream having been temporarily turned aside from its channel in order to provide a secret grave.

BUSH, GEORGE (1796-1859). An American biblical scholar; born in Norwich, Vt. He graduated at Dartmouth College in 1818 and studied at the Princeton Theological Seminary from 1820 to 1822. He was pastor of a church in

Indianapolis from 1824 to 1829, and was professor of Hebrew and Oriental literature at the University of the City of New York from 1831 to 1848. Among his works of that period were a *Life of Mohammed* (1832); a series of biblical commentaries under the title of *Notes on Genesis, Exodus, etc.* (1840-52); and *Anastasius; or the Doctrine of the Resurrection* (1844), in which he denied the existence of a material body in a future life. He embraced the doctrines of Swedenborg in 1847, and became editor of the *New Church Repository*. For his biography, consult Fernald (Boston, 1860).

BUSHBUCK (Dutch *boschbok*, bush-goat). A sportsman's name for several African antelopes frequenting bushy regions, especially two groups: (1) The genus *Tragelaphus*, otherwise known as 'harnessed' antelopes because of the often conspicuous vertical whitish stripes that characterize all except the most familiar bushbuck of South Africa, *Tragelaphus sylvaticus* (See colored Plate of ANTELOPES), which is also one of the smallest. These are among the handsomest of all antelopes in form and richness of color (which differs in the sexes), and they have been nearly exterminated by sportsmen south of the lake region. Another, the guib (*Tragelaphus scriptus*), is not larger than a goat, but the bongo of the equatorial west coast is 3 feet 7 inches tall; the nakong (*Tragelaphus Spekei*) is large and plain in color, and has a mane. (Compare KOODOO.) A very complete account of these antelopes was given by R. Crawshaw in the *Proceedings of the Zoölogical Society of London*, 1890. He says they are remarkably quick of hearing, and have an exceedingly loud and far-re-ounding bark. Leopards are their natural enemy, but in some regions they enjoy immunity from harm by men. "They are almost sure to be found in the native burial-places, which are grown up to thickets and avoided as ghost-haunted. . . . This fact has caused bushbucks to be regarded by many Nyassa natives as uncanny, and some natives will not eat their meat and do not like even to touch the skin." (2) The genus *Cephalolophus*. See DUKEER.

BUSH-DOG. (1) A small wild dog (*Ichneumon venaticus*) of the Guiana highlands, "with close hair and short legs and tail, distinguished from all other dogs by its small size and by the reduction of the molar teeth to one in the upper jaw." It resembles a fox in appearance and hunts in packs. Consult: *Proceedings of the Zoölogical Society of London* (1879, p. 664; 1880, p. 70); *Field* (London, Feb. 21, 1880). (2) The Potto.

BUSHEL (OF. *bussel*, Low Lat. *bussellus*, from *bussula*, dim. of Lat. *boxus*, box; literally, something made of boxwood). A dry measure used in America for grain, fruit, etc. The quarter contains 8 bushels, and the bushel 8 gallons, the gallon measuring 277.274 cubic inches, and holding 10 pounds avoirdupois of distilled water.

BUSH-GOAT. A bushbuck, especially *Cephalolophus*.

BUSH-HOG. The bosch-vark. See RIVER-HOG.

BUSHIDO, bōō-shē'dō (literally *bu*, military + *shi*, knight + *do*, way). The precepts of knighthood, under which that unique figure in Japanese and Asian history, the Samurai (q.v.), was reared. As in Europe, chivalry grew out of feudalism, Christianity interpreting it with con-

venient concessions, yet infusing it with spiritual data; so of Japanese chivalry, there were several sources, Buddhism, Shinto (q.v.), and Confucianism. (See CHU HI.) The characteristics of bushido were rectitude or justice, courage, benevolence, politeness, truthfulness, honor, and, above all, loyalty. It further inculcated in the Japanese knight, gentleman, and lady, self-control—the acme of which was realized in the institutions of suicide (see HARA-KIRI) and revenge, the girded sword being the soul of the Samurai. It gave lofty ideals and training, and a position to woman remarkable in Asia. Despite the abolition of feudalism, its mother and nurse, and the introduction of modern ideas and codes of law, bushido is still powerful as a regulator of Japanese life and institutions. Consult: Griffis, *The Religions of Japan* (London, 1895); Knapp, *Feudal and Modern Japan* (Boston, 1897); and Inazo Nitobe, *Bushido, the Soul of Japan* (Philadelphia, 1900).

BUSHING (Dutch *bus*, Ger. *Büchse*, box, from Lat. *buŕsus*). A perforated piece of metal screwed or pressed into place in certain machinery or objects for the purpose of receiving the wear of moving parts, to decrease the size of holes, or to secure a better joint, or one which will not stick; in the latter case the bushing is made of metal not very easily oxidizable, such as brass or bronze.

BUSHIRE, bū-shēr'. See ABUSHEHR.

BUSHMAN RIVER. A short stream in the southeastern part of Cape Colony, South Africa, about 100 miles long (Map: Cape Colony, L 9). It flows southeast and empties into the Indian Ocean a few miles east of Cape Padrone.

BUSHMASTER ('master of the bush'). The largest known venomous snake (*Lachesis mutus*), a pit-viper of the rattlesnake family, closely related to the fer-de-lance, and inhabiting the Amazonian region. "In length it equals the hamadryad, and in thickness the large African viper." Specimens 9 feet in length were measured by Catherine Hopley, who thinks the snake may sometimes exceed this length; but Waterton's often-quoted description of size and 'rainbow colors' is certainly greatly exaggerated. In color it is pale yellow, darker on the back and lighter below, with a chain of rich chocolate-brown jagged rhomboid spots, edged with a darker color, along the back. The tail tapers suddenly, and terminates in several "rows of spiral scales, which are slightly recurved or hooked at their summit," forming the rudiments of a rattle, and ending in a horny tip or spine. Its

TAIL OF BUSHMASTER.

teeth and poison apparatus resemble those of a rattlesnake and the fangs are immense, making it a most deadly serpent, and one very greatly dreaded. It is said to prey largely upon other snakes, and its venom has been utilized in medicine. It is terrestrial in habits, not climbing trees, but living in dens and holes in the ground, and frequenting river-banks. Darwin made the following interesting remarks upon it in his *A Naturalist's Voyage* (London, 1860).

"Cuvier . . . makes this a sub-genus of the rattlesnake, and intermediate between it and the viper. In confirmation of this opinion, I observed a fact, which appears to me very curious and instructive, as showing how every character, even though it may be in some degree independent of structure, has a tendency to vary by slow degrees. The extremity of the tail of this snake is terminated by a point, which is very slightly enlarged; and as the animal glides along, it constantly vibrates the last inch; and this part striking against the dry grass and brushwood produces a rattling noise, which can be distinctly heard at the distance of 6 feet. As often as the animal was irritated or surprised its tail was shaken, and its vibrations were extremely rapid. . . . This Trigonocephalus has, therefore, in some respects the structure of a viper with the habits of a rattlesnake; the noise, however, being produced by a simpler device."

This habit of vibrating the tail when excited is, however, common to many serpents, as, for example, the North American copperhead (q.v.). The French name for this snake is *le muet*; and 'bushmaster' is sometimes applied in Guiana to any large and dreaded serpent. The native name most widely accepted is *surucucú*. Consult: Hopley, *Snakes* (London, 1882); Bates, *A Naturalist on the River Amazon* (New York, 1884); Moles and Urich, "Serpents of Trinidad," in *Proceedings Zoological Society of London* (London, 1894). See colored Plate of FOREIGN VENOMOUS SERPENTS.

BUSHMEN (*bush* + *man*, from Dutch *boschjesman*, as living in the bush), or HOTTENTOTS. Peoples of the deserts of southern Africa, comprising wandering bands of hunters, almost the lowest of human beings. They are short of stature (1.529 meters) and yellow-brown in color. Their language is harsh, abounding in clicks and having few words. They subsist on wild roots, berries, and plants, insects, snakes, and game, usually half cooked, though they are acquainted with boiling and make fire with the two-stick fire drill. Game is taken by means of traps, and fish are caught in nets, by poisoning the waters, or with harpoons; the dog is the only domestic animal. The Bushmen live in clefts of the rock and caves in the mountains; in the plains a hole dug in the ground and roofed with reeds forms the house. They keep a fire burning during the night. Their social organization is not well understood; yet they appear to be the remnant of an old stock, for their legends are numerous, and zoötheistic in character. They have a rude artistic sense, evidenced by rock paintings and petroglyphs. See colored Plate of AFRICAN RACES.

BUSHNELL, HORACE (1802-76). An American theologian. He was born in Litchfield, Conn., April 14, 1802; graduated at Yale in 1827, where he studied law and theology; in 1833 became pastor of the North Congregational Church in Hartford, resigned 1859, and died there February 17, 1876. He was a voluminous writer on theological subjects, some of his works being *Principles of National Greatness*; *Christian Nurture* (1847); *God in Christ* (1849); *Christian Theology* (1851); *Sermons for the New Life* (1858); *Nature and the Supernatural* (1858); *Work and Play* (1864); *Christ and His Salvation* (1864); *Woman's Suffrage, the Reform Against Nature* (1869); *The Vica-*

rious Sacrifice (1865). He was also a writer for various periodicals and newspapers. He was a bold and original thinker, with peculiar eloquence of style. Though strongly evangelical in belief, he denied the Calvinistic theory of the atonement (known as the 'satisfaction theory'), and gave less than the ordinary emphasis to the distinction between the persons in the Trinity. These, with other divergences, led to his being accused of heresy; but ultimately the fellowship of the Congregational churches was found broad enough to include him, and he kept his standing therein with growing influence until his death. During his later years his health compelled his relinquishment of the active pastorate, but his labors in authorship were unintermitted. While his theory of the atonement, the so-called 'moral-power' view, has not commended itself in its exact form to the majority of evangelical Christians, and is adhered to by no organized sect or party, it cannot be denied that his moral earnestness, his spiritual power, his wondrous suggestiveness, his brilliancy of thought and style, and his broad mental scope, have profoundly modified the thinking of the present age, through almost the whole circle of Protestant denominations. Indeed, with his detestation of all provincialism and sectarianism, he would have chosen any other form of influence rather than that which is exercised by the leader of a party in the Church. His select works appeared in a collected edition (8 vols., 1876-77). For his life, consult: M. B. Cheney, *Life and Letters of Horace Bushnell* (New York, 1880); T. T. Munger (Boston, 1899).

BUSH-QUAIL (Anglo-Indian). See **BUTTON QUAIL**.

BUSHRANGERS. An Australian term originally applied to runaway convicts, who had taken to the 'bush' and become robbers. Early in the Nineteenth Century they established a reign of terror in sparsely settled Van Diemen's Land. In 1814 a band of bushrangers, 27 in number, carried on their operations till, in 1815, martial law was proclaimed. Under Governor Arthur (1824-30), 103 of these criminals were executed in two years. In 1830 a severe Bushranging Act was passed in New South Wales, where a gang of 50 desperadoes fought regular engagements with the settlers and police, and surrendered only when a detachment of soldiers was brought up from Sydney. In later years bushranging has been facilitated by the local land laws, which allow people to settle in isolated spots among the mountains, outside the range of police supervision, and thus any scoundrel is permitted to choose the most remote haunt for his headquarters. The thickly wooded mountainous districts of eastern Victoria and New South Wales, with a cattle-dealing population that included numerous 'sympathizers,' offered shelter to many bushrangers. Among the more notorious bushrangers were Geary, in 1817 leader of a dozen desperadoes, who was hunted down and killed by soldiers; Michael Howe, the self-styled 'King of the Ranges,' killed in 1818; Morgan, after a series of murders and robberies, surrounded and shot in 1865; and the Kelly gang of four armor-clad men whose list of outrages ended at Glenrowan, Victoria, in June, 1880, when three were shot and the leader captured and hanged in Melbourne in November.

BUSH-TIT (titmouse of the bush). One of the diminutive titmice of the genus *Psaltriparus*. They are plain ashy-gray or olive-gray pygmies, paler or whitish below, without bright colors or conspicuous markings, and are scarcely 4 inches long. They are found in the western and southwestern United States and in Mexico. The nests are large, woven of various vegetable tissues, pennisle, and with a lateral entrance. The eggs are six to nine in number, white, without markings.

BUSHWHACKER (*bush* + *whack*, to beat or hang about; hence to carry on guerrilla warfare). A term much in use during the Civil War in the United States (though well known before) to indicate men who pretended peace or neutrality, but who were ready to make secret attack whenever opportunity offered. They were numerous in some Western States, where many of them were summarily shot as outlaws.

BUSHY RUN, BATTLE OF. See **BOUQUET, HENRY**.

BUSINESS HOURS. Those hours of the day during which places of business are customarily open. The business hours of banks vary in different places, but ordinarily cover a shorter period than the business hours of mercantile or manufacturing establishments. When negotiable paper is payable at a bank, it is to be presented for payment within the regular banking hours. When payable at any other place of business, presentment is good if made within the ordinary business hours of such places.

BUSIRANE, bu'si-rân'. A magician in Spenser's *Faerie Queene*. For a long time he holds Amoret, Belphoebe's sister and Sir Scudamour's mistress, in his thrall. He is named after a mythical King of Egypt, Busiris, who was killed by Hercules.

BUSIRIS (Gk. *Βούσιρις*, 'House of Osiris'). A city of ancient Egypt devoted to the cult of the god Osiris. It was situated about the centre of Lower Egypt, and is usually identified with the modern Abusir, just south of the parallel of 31°. There were several cities of the same name in Egypt. Another Busiris, whose modern name is also Abusir, was situated not far from Memphis and is well known for the pyramids in its vicinity.

BUSK, GEORGE (1807-86). An English scientist, born in Saint Petersburg, Russia. He studied surgery, in 1832 was appointed assistant surgeon to the seamen's hospital ship *Grampus*, subsequently was transferred to the *Dreadnaught*, and retired in 1855 with the rank of full surgeon. Subsequently he was occupied entirely with scientific pursuits. As the result of his earlier study he published his *Catalogue of Polyzoa in the British Museum* (1852-54), and a monograph on *Polyzoa of the Crag* (under the direction of the Palaeontographical Society, 1859). Later he turned his attention to the Post-Tertiary mammalia derived from valley deposits and bone caves, and wrote papers on the rhinoceros, the hyena, the elephant (African elephant), and the extinct bears. He was also interested in ethnology. In 1850 he was elected a fellow of the Royal Society, and in 1859 fellow of the Geological Society of London. At the time of his death he was considered an authority on the lowest division of the molluscan series.

BUSK, HANS (1815-82). One of the foremost originators of the volunteer movement in England. He was educated at King's College, London, and Trinity College, Cambridge, and in 1841 was called to the bar. While an undergraduate he sought to interest the Government in the establishment of rifle clubs as a means of national defense. Though discouraged by Lord Melbourne, he formed a rifle club at the university, in 1858 rehabilitated the Victoria Rifles, then the only existing volunteer corps, and furthered the enterprise by monographs and lectures. He was the first to suggest the advisability of life-ship stations, and equipped at his own expense a model ship. He also assisted in the founding of a school of cookery at South Kensington. His most important publication is *The Navies of the World, Their Present State and Future Capabilities* (1859).

BUSKIN (of uncertain origin). A kind of half-boot, lacing tight to the leg. The ancient tragic actors wore buskins (*cothurni*), often with thick soles, to add to their stature. Hence the buskin is often put for tragedy, as the slipper or sock (*soccus*, a flat-soled shoe) for comedy. The name is sometimes used by modern writers to describe the hunting boots worn by Diana, and often by other hunters or horsemen in ancient art.

BUS'RA. See **BASRA**.

BUSSA, bōōs'sā. See **BUSSANG**.

BUS'SANG. A town of Central Africa, in the British Niger Coast Protectorate (Map: Africa, E 3). It is situated on an island of the Niger and is surrounded by a wall. Its population is estimated at about 12,000. Bussang was the scene of Mungo Park's death.

BUSSEY, būs'ē, **BENJAMIN** (1757-1842). An American merchant and philanthropist, born in Canton, Mass. He served as a private soldier throughout the Revolutionary War; then began business in Boston, and accumulated a large fortune, which he bequeathed to Harvard University—one-half for the support of the law and divinity school and one-half for the foundation of the Bussey Institute, a school of agriculture and horticulture, for which special object he gave a large farm near Boston. His total bequest was estimated at \$350,000.

BUSSLER, būs'lēr, **LUDWIG** (1838—). A German musical instructor and critic, born in Berlin. He was a pupil of Grell, Dehn, and Wieprecht, was for some time a musical director at Memel, in East Prussia, and later became an instructor in various conservatories in Berlin. In 1883 he was appointed musical critic of the *Berlin National-Zeitung*. He has published a number of text-books, including *Musikalische Elementarlehre* (1867; 7th ed., 1897); *Kontrapunkt und Fuge im freien Tonsatz* (1878); *Musikalische Formenlehre* (1878; 2d ed., 1894); *Kompositionalehre* (2 pts., 1878-79); *a Geschichte der Musik* (1882); and *a Lexikon der musikalischen Harmonien* (1889).

BUSSON, bu'sōn', **CHARLES** (1822—). A French painter, born at Montoire, Loire et Cher. He was a pupil of Rémond and Français, and first exhibited in 1856. His landscapes have a poetical charm, and a certain elegance, but they suffer by comparison with the richer, weightier Barbizon pictures. His "La Chasse au Marais"

and "Les Ruines du Château de Lavardin" are in the Luxembourg.

BUSSONE, bōōs-sō'nā, **FRANCESCO**. See **CARMAGNOLA**.

BUSSORA, bōōs'sō-rā. See **BASRA**.

BUSSU (būs'sōō) **PALM** (native Brazilian name). (*Manicaria saccifera*.) A South American palm, growing in the tidal swamps of the Amazon. The stem is 10 to 15 feet high, curved or crooked, and deeply ringed. The leaves are simple or undivided, and are the largest of the kind produced by any known palm, being often 30 feet long, and 4 or 5 feet wide. The flower clusters are branched, drooping, and the fruit is of an olive color, large, hard, and three-seeded. The leaves make excellent and durable thatch, being split down the midrib, and laid obliquely on the rafters, so that the furrows formed by the veins lie in a nearly vertical direction, and serve as so many little gutters to carry off the water. The spathe, taken off entire, is used by the Indians as a bag, or the larger ones are stretched out to make caps. When split, the spathes make a kind of strong, coarse cloth. A second species was formerly reported from Guatemala, but they are probably identical.

BUSSY D'AMBOIS, bu'sē' dān'bwā'. The title of a play by George Chapman. The date of its first production is placed, on internal evidence, in 1604. A sequel, under the title *The Revenge of Bussy d'Ambois*, appeared in 1613, and an adaptation by D'Urfé in 1691.

BUSSY-RABUTIN, bu'sē' rā'bu'tān', **ROGER**, Comte de. (1618-93). A French soldier and courtier, the author of the *Histoire amoureuse des Gaules* (1665). This work is a thinly veiled version of the notorious Court scandals of his own time, and in part, at least, of his own creation. It created a deep sensation and influenced the development of the realistic novel toward the fictitious memoir. Bussy-Rabutin was a relative of Mme. de Sévigné (q.v.), came of an illustrious family, and was educated by the Jesuits. The *Histoire* was written for private circulation among friends, but was surreptitiously copied and published by the Marchioness de Baume in Holland with an entirely superfluous key. Bussy-Rabutin was arrested (1665), imprisoned for thirteen months in the Bastille, and then exiled to Burgundy, where he spent the remainder of his life in peace. Meanwhile the work grew by unauthorized and more outrageous additions in prose and verse. Bussy's original portion is an airy, graceful, but very realistic picture of a corrupt society, which perhaps no other author could have given. Bussy's *Mémoires*, of minor interest, appeared in 1696, and his *Lettres* 1697-1709.

BUST (Fr. *buste*, It. *busto*, from Med. Lat. *bustum*, the trunk of the body). In plastic art, the name given to a representation in the round of the head, neck, and breast of the human body. It was a form of sculpture apparently unknown to Egyptian, Assyrian, and other Oriental arts, though the Egyptians of the early Empire made fine portrait heads. As early as the Sixth Century B.C. the Greeks made *Hermæ*, heads of *Hermes* or *Dionysus*, mounted on pillars, and this form, common for the ideal heads of the Sixth and Fifth centuries, was used as the favorite form of bust until the Roman period. At this time they were often made double—two

heads back to back. It was not until Alexander's time that busts were commonly used for purposes of portraiture in Greece, for until then sculpture had concerned itself less with realistic reproduction than with types. After that time the bust became perhaps the favorite form of portraiture. The two most important known series are portraits of Alexander—with the head drawn down on one side and the eyes raised—and of his successors the Ptolemies of Egypt and the Seleucids of Syria, as well as the minor kings of the Hellenic East, such as the Attalids. Another large class of Hellenistic busts are those of men of letters—poets, philosophers, orators—such as Plato, Zeno the Stoic, Epicurus, and other philosophers, of Isocrates and Demosthenes. To these authentic portraits should be added ideal heads of earlier personages, such as Homer, Pericles, Anaxagoras, and other early philosophers, of whom there were certainly no contemporary likenesses. At this time bronze was even more popular than marble as a material for busts. Various sizes were in vogue; some were more than life-size, for use in public places, others were diminutive, for chamber decoration. Founders of museums and libraries and wealthy amateurs sought to procure sets of such busts.

The portraitists of this period showed great ability in expressing the dominant traits of character without descending to realism. In this respect they differed from those other great portraitists of the ancient world, the Etruscans and Romans. The custom of these two peoples of preserving and carrying in procession the *imagines*, wax portraits of ancestors who had distinguished themselves, contributed to the popularity of portrait busts. The superb bronze Etruscan bust of the elder Brutus in the Capitoline probably antedates any of the Greek portraits, and its form of draped shoulders in place of the herm-shape was afterwards almost universally adopted. The Forums and other public places were encumbered under the Republic with marble and bronze portrait figures. Still, the busts preserved to us seem all to belong to the Imperial period, or the generation preceding it; those that represent Republican worthies being apparently not contemporary. Even the heads of the elder Scipio Africanus are of doubtful authenticity. The custom of collections of *lares* and *penates* popularized the use of busts, as did the founding of libraries, museums, and private collections. Villas, houses, and public buildings were filled with busts. There is an uninterrupted chronological series from Augustus to Julian the Apostate. The most numerous series is that of the Emperors and members of the Imperial family. The largest collection of these is at present in the Capitoline Museum; the next in the Vatican Museum in Rome. The British Museum and Louvre have some good examples. It is by means of a comparison with coins and medals that most of these can be identified with certainty, for the inscriptions on busts are not always reliable. The series of portrait busts of philosophers and poets was far less popular than before the Empire. Private collectors of busts were not unknown, as, for instance, those of M. Terentius Varro and Pomponius Atticus. The letters of Cicero and Pliny show how they were made. One such collection has fortunately been unearthed in the Villa dei Papiri at Herculaneum, belonging to

a philosopher of the time of Cicero. This group, now in the Naples Museum, and mainly of bronzes, is the finest of its kind preserved from antiquity. The collector's taste was catholic. His busts begin with c.500 B.C., and the earliest are ideal heads of athletes; each century is represented with exquisite works; the ages of Polyclethus, of Praxiteles, of Lysippos. The masterpieces are perhaps some large heads of royal personages of the Alexandrian Age, supposed to represent some of the Ptolemies, the so-called 'Plato,' 'Berenice,' and 'Seneca.' In the set of miniature busts, for the decoration of library or *larium*, are a number of great philosophers and orators, some inscribed with their names.

The great period of portraiture closes with Septimius Severus and Caracalla, at the beginning of the Third Century A.D., and the decadence is then continuous to the time of Justinian in the Sixth Century, when busts ceased to be executed. It remained apparently a lost art until the Thirteenth Century. Then, curiously enough, a proto-Renaissance in southern Italy, under Frederick II., included the revival of portraiture in the form of busts, such as those of Frederick himself, and of his ministers, evidently imitated from the antique. The art of the Fifteenth Century was so thoroughly humanistic that portraiture was one of its favorite modes of expression. The permanent resurrection of the bust was then effected by Donatello, who was equally successful in his portraits of men, which were forceful, of women, which were graceful, and of children, where the real child-type was for the first time expressed in art with perfect mastery. His little busts of the Infant Christ and Saint John are among his most charming works. The Florentine School continued in this new field. Desiderio da Settignano and Mino da Fiesole were especially successful. In the Sixteenth Century the Lombard School of Portraits was more realistic, especially the branch established at Modena, which was partial to terra-cotta and colored busts. The fashion then spread to other nations, especially to France and Germany, where busts were executed in the prevalent styles, though none equal those of the Fifteenth Century, except a few of the most recent examples, especially in France.

Since the Sixteenth Century, portraiture has preferred to express itself in painting, and this part of the plastic sense has not been active. How far short ordinary modern achievement falls in this field may be judged by comparing the series of marble busts of great Italians dotted about the Pincian Gardens in Rome with any corresponding collection of ancient busts. King Ludwig I. of Bavaria gathered in his Walhalla a remarkable collection of busts.

BIBLIOGRAPHY. Several attempts have been made to publish sets of illustrations reproducing ancient busts. Such was the *Virum Illustrium Imagines* of Fulvio Orsini (Rome, 1568; Antwerp, 1606). The first scientific classification was by Visconti (q.v.) in his *Iconographie grecque* (Paris, 1811), and *Iconographie latine* (Paris, 1817). Bernoulli has given in his *Derhaltenen Bildnisse berühmter Griechen* (Basel, 1877) a brief and very incomplete account of Greek portraits, and in his *Römische Iconographie* (4 vols., Stuttgart, 1882-94) a far fuller reproduction of Roman portraits. The *corpus*

BUSTARDS

1. GREAT BUSTARD (*Otis tarda*).
 2. HOUBARA (*Otis macqueenii*).
 3. SUN BITTERN (*Eurypyga helias*); nuptial display.

4. THICK-KNEE OR STONE CURLEW (*Œdionemus œdionemus*).
 5. KAGU (*Rhynochetus jubatus*).
 6. LITTLE BUSTARD (*Otis tetrax*).

for this subject will be Brunn and Arndt, *Griechische und römische Porträts* (Munich, 1891, et seq.), a large folio publication with fine photographs and careful descriptions. Correspondingly important for the portraits of the Italian Renaissance is Bode's folio work, also with superb photographs, *Die Denkmäler der Renaissance in Italien* (Munich, 1894).

BUSTAMANTE, boo'stá-mán'tá, CARLOS MARÍA DE (1774-1848). A Mexican historian, born at Oajaca. In 1812 he commanded a regiment under Morelos in the first Mexican war for independence, and in 1821 marched with Santa Anna to the capital. From 1805 he was editor of the *Diario de Méjico*. He wrote several works of value for the study of modern Mexican history. These include *Cuadro histórico de la revolución mexicana* (2 vols., 1823; 6 vols., 1843-46); *Historia del Emperador Don Agustín de Iturbide*; and *Historia de la invasión de los Anglo-Americanos en Méjico* (1847).

BUSTAMENTE, boo'stá-mán'tá, or **BUSTAMANTE**, boo'stá-mán'tá, ANASTASIO (1780-1853). A Mexican politician. He was born in Tiquilpan (Michoacan), Mexico, became a physician, and joined the militia in 1808. He was among the earliest supporters of Iturbide when the revolt against Spain began in 1821. When Iturbide was overthrown in 1823, Bustamente went into retirement, but in 1829 he was chosen Vice-President of the Republic, exercising the full powers of President. He resigned when Santa Anna's revolution of 1832 proved successful, and the next year was exiled, living in Europe until 1836. After the downfall of Santa Anna, in 1836, he was recalled, and in 1837 was elected President. After a prosperous administration, he was compelled by disturbances to resign the Presidency in favor of Santa Anna in 1839 and again went to Europe, returning in 1845. He participated in the war with the United States.

BUSTAN, boo-stán' (Pers. *bā*, fragrance + *stān*, place; cf. *Afghanistan*, *Baluchistan*, *Kurdistan*, etc.). The title of a number of Persian works, the best known of which is by Sadi (q.v.). The term means literally a flower-garden, and suggests our own use of the word *anthology*, i.e. a collection of beautiful writings.

BUSTARD (variant of *bistard*, OF. *bistarde*, *oustarde*, from Lat. *avis tarda*; *avis*, bird, *tarda*, slow). One of the large game-birds of the Old World family *Otididae*, which partakes of the characteristics of both the cranes and the plovers. They inhabit open country, being partial to the steppes of Russia and southwestern Asia, and to the plains of Africa; and are both swift runners and powerful on the wing, although the species vary in their liking for flight. The great bustard (*Otis tarda*), extinct in Great Britain, but found in open regions "from Spain to Mesopotamia," is a large bird, weighing from 25 to 30 pounds ordinarily, gay in color, with wings strongly marked with black and white, and the back, shoulders, and breast (of the male) ornamented with russet, bay, and black. It feeds mainly on leaves, buds, fruits, etc., but seems to take insects, worms, or anything edible it meets. Its flesh is tender, and it is regarded as a first-class game-bird. The little bustard (*Otis tetrax*) is a smaller and more handsome species, inhabiting both shores of the Mediterranean. The houbaras (*Otis houbara* and *Otis*

Macqueeni) range from Morocco to India, and form the favorite game-birds of the Asiatic plains, where they are much hunted on camel-back, the sportsman so mounted being able to get near a flock that would take early alarm at his approach on foot. The Anglo-Indian name, 'floricant,' is applied to several smaller Indian species, and those of the South African plains are called knoorhaans by the Dutch and English colonists. Australia possesses a species, but none occur in the New World, so that the distribution, as well as the ornithological affinities of these birds, is very puzzling. A structural point of interest is the presence in several species of a highly distensible gular pouch, with an opening under the tongue, concerning which much speculation has been indulged in. Stejneger is no doubt right in declaring that it is simply a secondary sexual character, for display in courtship, comparable to that of the pectoral sandpiper. Attempts to domesticate these birds have failed, although individuals may easily be tamed, from their inability to breed in confinement. Certain other birds are erroneously called bustards; as the Magellanic goose of Argentina. Consult Chapman and Buck, *Wild Africa* (London, 1893). See Plate of BUSTARDS, etc.

BUSTARD QUAIL (Anglo-Indian). See **BUTTON QUAIL**.

BUSTO-ARSIZIO, boo'stò ár-sé'tsè-ō. A city in northern Italy, 21 miles northwest of Milan. The church, which was designed by Bramante, contains frescoes by Gaudenzio Ferrari (Map: Italy, C 2). The town has manufactures of cotton goods and a trade in wine. Population, in 1881, 13,000; in 1901, 19,673.

BUSULUK, boo'soolook'. See **BUZULUK**.

BUSY, biz'1, ZEAL-OF-THE-LAND. A caricature of the Puritan, occurring in Ben Jonson's comedy, *Bartholomew Fair*. He is a glutton and a boor, a philistine and a hypocrite. The name has since become typical of a notorious class.

BUSYBODY, THE. The *nom de plume* signed by Benjamin Franklin to a series of papers written in the manner of Addison's *Spectator*. They appeared at the time of his purchase of the *Philadelphia Gazette*.

BUSYBODY, THE. A comedy by Mrs. Centlivre, produced at Drury Lane, May 12, 1709, and published in quarto the same year. It is partially founded on Jonson's *The Devil is an Ass* and first introduces the famous character of Marplot, after which the sequel of the play, produced at Drury Lane, December 30, 1710, and printed in quarto 1711, is called. Henry Woodward produced a revision of the latter play under the title of *Marplot in Lisbon*.

BUTADES. A Greek potter of Sicily, probably before B.C. 600. A clay relief dedicated by him at Corinth was believed to be the first ever made. According to the legend, Butades, seeing on a wall a drawing in outline of his daughter's lover, molded the face in clay, and baked it with the tiles which it was his business to make. This raised relief, and also the relief formed by pressing in the background with a stamp, were first used to ornament the ends of roof-tiles, and later for other purposes. All this is probably Corinthian legend, and little more than the existence of the ancient relief with the name of Butades can be regarded as historical.

BUTANE (from Lat. *butyrum*; see **BUTTER**) and **I'SOBUTANE**. Two gaseous compounds of carbon and hydrogen similar to marsh-gas. They are isomeric, i.e. they have the same molecular formula (C_4H_{10}), yet differ in their physical and chemical properties. Butane is one of the gases found dissolved in crude petroleum.

BUTCH'ER, SAMUEL HENRY (1850—). A British classical scholar. He was born in Dublin, studied at Marlborough College, and then became a fellow of Trinity College, Cambridge (1874-76), and fellow and lecturer in University College, Oxford (1876-82). He became professor of Greek at the University of Edinburgh in 1882, succeeding John Stuart Blackie. With Andrew Lang, he published an admirable prose translation of the *Odyssey* (1879). His own published works include a small volume on *Demosthenes* (1881); *Some Aspects of the Greek Genius* (1891); and *Aristotle's Theory of Poetry and the Fine Arts, with a Critical Text and Translation of the Poetics* (1895).

BUTCHER-BIRD. A shrike, so called from its habit of hanging up on thorns, fence-posts, etc., the animals it captures for food. A belief in Europe that these victims numbered nine in each place gave it the German name 'nine-killer.' See **SHRIKE**.

BUTE, büt (from Gael. *buith*, *both*, but, dwelling, Engl. *booth*, referring to the cell of Saint Brandon). An island in the Firth of Clyde, forming, with Arran, 5 miles southwest, and some smaller islands, the County of Bute, Scotland (Map: Scotland, C 4). It is separated from the coast of Argyll by a strait less than 1 mile wide, called the Kyles of Bute. It is about 16 miles long, from $1\frac{1}{4}$ to $6\frac{1}{4}$ miles broad, with an area of 60 square miles. The surface to the north is high, rugged, and barren; in the centre and south, low and undulating, and comparatively fertile. The highest point rises 875 feet. The coast is rocky and has some bays. The island has several small lakes. The climate is milder than in any other part of Scotland, and is much resorted to by invalids. The chief town is Rothesay (q.v.). Most of the island belongs to the Marquis of Bute, whose beautiful seat, Mount Stuart, is about 4 miles south from Rothesay. Among its antiquities are Rothesay Castle, Kames Castle, Kilmorie Castle, Saint Blaine's Chapel, Dunggyle, a remarkable vitrified fort on a high crag on the southwest coast, and the Devil's Cauldron, a circular erection, the original purpose of which is unknown. Bute and the neighboring isles were for many centuries subject to the Norwegians. Population, in 1891, 11,740; in 1901, 12,174.

BUTE, JOHN STUART, third Earl of (1713-92). A British statesman whom Wilkes reviled, at whom Junius thundered, and against whom Chatham declaimed as "one behind the throne greater than the throne itself." He was born in Edinburgh, May 25, 1713, and succeeded to the peerage in 1723. He was educated at Eton and early showed a taste for mathematics, mechanics, and natural science, especially botany. About 1737 he attracted the favorable notice of Frederick, Prince of Wales, who appointed him a lord of the bedchamber. After the death of the Prince he became Groom of the Stole to his son, afterwards George III., over whose mind he obtained a strong influence. In March, 1761, he became Secretary of State, and was Premier from

May, 1762, to April, 1763. His Government was one of the most unpopular that ever held office in Britain, its fundamental principle being royal autocracy, with an executive government of obedient servants. In peril from mob violence, he resigned, but was always hated for his influence over the King. He devoted himself to the scientific pursuits which had early attracted him. He was a liberal patron of literature and art, and left an immense library, a fine collection of astronomical and philosophical instruments, and a gallery of splendid pictures, preserved to this day. He died March 10, 1792, in his seventy-eighth year, from the effects of a fall from a cliff while botanizing.

BUTEA (Neo-Lat., from John, Earl of Bute). A genus of plants of the order Leguminosæ. The best-known species are *Butea frondosa* and *Butea superba*, natives of India: the former are very widely diffused throughout that country, generally appearing as a sort of shrub in the neighborhood of villages, but in the jungles growing into a small tree. These trees present a gorgeous sight when covered with racemes of large, deep-scarlet flowers. They have trifoliate leaves, with roundish leaflets, velvety beneath. They yield a resinous exudation, which occurs in the form of lurid red tears, often covering the twigs, and is one of the kinds of lac brought to the market in India. *Butea frondosa* is called the Dhak or Pulas tree in India. The bark and roots are very fibrous, and the strong fibre is used for calking boats, rope-making, etc. The flowers, called teeasoo or keesoo, yield a beautiful yellow or orange dye. The gum exuded by *Butea frondosa* is said to contain more than 70 per cent. tannin.

BUTESHIRE, büt'shēr. A county in the west midland division of Scotland, comprising the isles of Bute (q.v.), Arran (q.v.), and the Cumbraes, Holy Isle, Pladda, Inchmarnoch, and other smaller islands (Map: Scotland, C 4). Area of the whole, 218 square miles, of which about one-sixth is cultivated. The county town is Rothesay, in the island of Bute. Population, chiefly engaged in fishing, in 1801, 11,800; in 1851, 16,600; in 1891, 18,404; in 1901, 18,800.

BUTIN, bu'tän', ULYSSE LOUIS AUGUSTE (1838-83). A French artist, born at Saint Quentin, Aisne. He studied under Picot and Pils. His works are genre subjects, usually studies of fisher folk, and the following in this manner are notable: "Les Moulières à Villerville" (1874); "Le Départ" (1881); "La Pêche." "L'Attente," "Le Cabestan" (1876), and "L'Enterrement d'un Matelot à Villerville" (1878), in the Luxembourg.

BUTLER. A borough and county-seat of Butler County, Pa., on Conequenessing Creek, 31 miles north of Pittsburgh, and on the Pennsylvania, the Pittsburgh and Western, the Buffalo, Rochester and Pittsburgh, and the Bessemer and Lake Erie railroads (Map: Pennsylvania, B 3). The surrounding country is rich in oil, natural gas, coal, and iron. Glass manufacture, including bottles and plate glass, is the chief industry; there are also planing-mills, flour-mills, and manufactures of silk, carriage-white lead, and oil-well tools. Extensive steel-car works are in course of erection. Butler has a fine court-house and a well-equipped, though

small, public library. Settled about 1798, Butler was first incorporated in 1803. It is governed by a burgess, elected for three years, and a borough council. Population, in 1880, 3163; in 1890, 8734; in 1900, 10,853.

BUTLER, ALBAN (1711-73). An English hagiographer. In 1719 he was sent to the English Roman Catholic College at Douai, where he was professor of philosophy, and afterwards of divinity. He traveled on the Continent, was chaplain to the Duke of Norfolk, and was president of the English College of Saint Omer, where he died. His great work, the *Lives of the Saints*, a kind of latter-day *Acta Sanctorum* (4 vols., 1756-59), required thirty years for its completion, and shows vast erudition and research. The second edition (with previously omitted notes) was published in twelve volumes after his death, and many editions and translations have been issued since.

BUTLER, AMOS WILLIAM (1860—). An American anthropologist and ornithologist, born at Brookville, Ind. He was educated at the University of Indiana, at Bloomington; was one of the founders of the Indiana Academy of Science, and in 1895 was elected its president. From 1896 to 1897 he was ornithologist to the State Department of Geology and Natural Resources of Indiana. He was secretary of the Section of Anthropology of the American Association for the Advancement of Science from 1886, of the section of biology from 1889, and general secretary of the association from 1891. In 1900 he became a vice-president of the association, in charge of the Section of Anthropology. His publications include *Notes on the Range and Habits of the Carolina Parakeet* (1892); *Urodela—the Salamanders. Genus Cryptobranchus Leuckart* (1892), and a work on *The Birds of Indiana*.

BUTLER, ANDREW PICKENS (1796-1857). An American politician. He graduated at South Carolina College, and in 1817 became a lawyer. He served in the Legislature in 1824, and in 1833 was appointed judge of the Circuit and Supreme courts. In 1846 he was appointed United States Senator, and served as such until his death. It was Sumner's reply to Butler's last speech in the Senate that led to the assault upon the former by Preston S. Brooks (q.v.).

BUTLER, BENJAMIN FRANKLIN (1795-1858). An American lawyer and politician. He was born at Kinderhook Landing, N. Y., received a district-school education; studied law, and was admitted to the bar in 1817. He was a partner of Martin Van Buren until 1821, and gained rapid eminence in his profession. In 1825-27 he was associated with Messrs. Duer and Spencer on the commission to revise the statute laws of the State, and with them carried through the work in such a way as to win the enthusiastic praise of the New York bar. He was elected to the State Legislature in 1827, was the representative of New York on the commission which, in 1833, readjusted the New York-New Jersey boundary; was Attorney-General in the Cabinet of Jackson from 1833 to 1837, and in that of Van Buren from 1837 to 1838; and from October, 1836, to March 4, 1837, acted also as Secretary of War. From 1838 to 1841 he was district attorney for the United States at New

York City; in 1844 he was at the head of the Electoral College in New York; and from 1845 to 1848 he was again district attorney, having declined the position of Secretary of War in President Polk's Cabinet. He organized the department of law in the College of the City of New York, and for some time was the principal professor. After 1848 he devoted himself wholly to his private practice, and was engaged in several notable cases; but in 1858, owing to failing health, he visited Europe, and on November 8 died in Paris. As a lawyer he was recognized as one of the foremost members of the New York bar, and practiced on equal terms with such men as Van Buren, Henry, Duer, Spencer, and Nelson. Chancellor Kent once said of him: "The student, in pursuing his studies, is surprised to find in all his books such vast and various memoranda of the professional labors of this remarkable lawyer." In politics he was for the greater part of his life an enthusiastic Democrat, but, disapproving of his party's attitude toward the Kansas-Nebraska Bill and the repeal of the Missouri Compromise, he joined the newly organized Republican Party in 1856 and voted for Frémont. A number of addresses delivered by him before the New York Historical Society were published under the title *Outlines of the Constitutional History of New York* (1847). For a biographical sketch, consult *Proceedings and Addresses on the Occasion of the Death of Benjamin F. Butler* (New York, 1859).

BUTLER, BENJAMIN FRANKLIN (1818-93). An American lawyer, politician, and general. He was born in Deerfield, N. H., November 5, 1818; graduated at Waterville College (now Colby University), Maine, in 1838; was admitted to the bar in 1840, and began at Lowell, Mass., a practice which soon became large and gave him a wide professional repute. He entered political life as a Democrat, was sent in 1853 to the State Constitutional Convention and to the State Legislature, where he was instrumental in effecting the passage of a bill for reducing the hours of labor in factories from thirteen to eleven, and in 1859 was elected to the State Senate. He was a delegate to the National Democratic Convention at Charleston, S. C., in 1860, and to the subsequent convention at Baltimore, and was among those who withdrew from the latter. In the same year he was an unsuccessful candidate for Governor of Massachusetts. Upon the outbreak of the Civil War he was a brigadier-general of the State militia. After taking possession of Annapolis he occupied Baltimore without opposition, and in May, 1861, was made a major-general of volunteers and put in command of the Department of Eastern Virginia, with headquarters at Fortress Monroe. While here he refused to surrender fugitive slaves who penetrated his lines, and in this connection issued his famous order designating slaves as 'contraband of war.' After taking some part in the operations against the coast forts of North Carolina, he was sent, in the following spring, to Ship Island and up the Mississippi. When the expedition against New Orleans was organized he was placed in command of the troops, and on May 1, 1862, after Farragut had run by Forts Jackson and Saint Philip, and had destroyed the Confederate fleet, Butler took possession of New Orleans, and in-

stituted a vigorous administration which, though characterized by great ability and for the most part by good judgment, was warmly criticised. Especial notoriety attached to his "Order No. 28," issued after considerable provocation, in which he directed that any woman who should publicly insult United States officers should be "regarded and held liable to be treated as a woman of the town plying her avocation." The order aroused the intense anger of the South, and for this and other acts during his administration, President Jefferson Davis in December ordered by proclamation that Butler should be considered as a felon and an outlaw, and if captured should instantly be hung. Butler's order also caused much indignation abroad, and especially in England, and for some time threatened seriously to compromise the relations between the British and American Governments. Butler was relieved from his post by Gen. N. P. Banks (q.v.), in December, 1862, and toward the close of 1863 was made commander of the Department of Virginia and North Carolina, in which capacity, after being hemmed in for some time at Bermuda Hundred (q.v.), he coöperated in Grant's general movement against Petersburg. In October, 1864, he was temporarily put in command at New York City, in view of anticipated disturbances during the approaching election, and in the following December commanded an expedition against Fort Fisher. His conduct during this movement led to his removal by Grant, whose orders he had disregarded, and to the ending of his military career. Devoting himself thereafter to law and politics, he was elected to Congress as a Republican in 1866, remained a member during ten of the following twelve years, took an active part in the debates over the various Reconstruction measures, and was one of the seven managers, for the House, of the impeachment trial of President Andrew Johnson. In 1871 he was the Republican nominee for Governor of Massachusetts, but was defeated. Having left the Republican Party and allied himself with the Greenback and Labor movement, he became an independent Democratic candidate for Governor in 1878, and again in 1879, but was each time defeated. He acted regularly with the Democrats in the campaign of 1880, and was finally elected Governor by that party in 1882. In the following year he was defeated for the same office, and in 1884, refusing to be bound by the action of the Democratic National Convention, of which he had been a member, he accepted a Presidential nomination from the Greenback-Labor and Anti-Monopolist parties; but was defeated in the ensuing election. He died suddenly at Washington, January 11, 1893. He published *The Autobiography and Personal Reminiscences of Major-General B. F. Butler: Butler's Book* (1892). Consult: Parton, *Butler in New Orleans* (New York, 1863); and Bland, *Life of Benjamin F. Butler* (Boston, 1879).

BUTLER, CHARLES (1750-1832). A prolific English writer, nephew of Alban Butler (q.v.). He was educated at Douai, was entered at Lincoln's Inn in 1775, and first practiced as a conveyancer, but was regularly called to the bar in 1791, when the disability under which the Roman Catholics suffered was removed.

Throughout his life he labored earnestly for the repeal of the law against English Catholics. His literary activity was enormous. Among his works were lives of Erasmus, Grotius, Fénelon, Bossuet, Alban Butler, and others. He also published a continuation of his uncle's *Lives of the Saints*, and completed Hargrave's edition of *Coke upon Littleton*.

BUTLER, CHARLES (1802-97). An American lawyer and philanthropist. He was born at Kinderhook Landing, Columbia County, N. Y.; studied law in the office of Martin Van Buren at Albany, N. Y.; was admitted to the bar in 1824; became assistant district attorney of Genesee County; and as agent of the New York Life Insurance and Trust Company, was influential in building up the western part of the State. He obtained extensive interests in land on the site of the present cities of Chicago, Ill., and Toledo, Ohio, and by this means, by large railway investments, and by his adjustment of the State debts of Indiana, Michigan, and Illinois, accumulated a fortune. In 1835 he was a founder of the Union Theological Seminary, New York City, and in 1836 was appointed to the council of New York University, of which he was long president.

BUTLER, CLEMENT MOORE (1810-90). A Protestant Episcopal clergyman, born in Troy, N. Y. He graduated at Trinity College in 1835, and at the General Theological Seminary in 1836, and was rector of churches in Boston and Washington, and, from 1862 to 1864, of Grace Church, Rome, Italy. For the next twenty years he was professor of ecclesiastical history in the Protestant Episcopal Theological School, Philadelphia. He published: *The Book of Common Prayer Interpreted by Its History* (1846); *Old Truths and New Errors* (1850); *Saint Paul in Rome* (1865); *Inner Rome* (1866); and *Manual of Ecclesiastical History* (2 vols., 1868-72).

BUTLER, HENRY MONTAGUE (1833—). An English clergyman and educator, born at Gayton, Northamptonshire. He studied at Trinity College, Cambridge, and was headmaster of Harrow School from 1859 to 1885. In 1885-86 he was Dean of Gloucester, and in 1897 was appointed honorary Canon of Ely. He became master of Trinity College, Cambridge, in 1888, and vice-chancellor in 1889 and 1890. His published works, consisting chiefly of volumes of sermons, include: *Sermons Preached in the Chapel of Harrow School* (1861; a second series in 1866); *Belief in Christ, and Other Sermons* (1898); *Words of Good Cheer for the Holy Communion* (1898); and *University and Other Sermons* (1899).

BUTLER, HOWARD RUSSELL, N.A. (1856—). An American landscape and marine painter, and also a lawyer. He was born in New York, March 3, 1856, graduated at Princeton College, 1876, and at the Columbia Law School, 1881. He studied painting at the Art Students' League in New York, and in Paris. His pictures are painted with direct reference to nature, good in color, and vivid as impressions of the scene. It was largely through his instrumentality that the structure which is the home of the Fine Arts Society, of which he was the first president, was built.

BUTLER, JAMES. See ORMOND.

BUTLER, JAMES GLENTWORTH (1821—). An American clergyman of the Presbyterian Church. He was born in Brooklyn, N. Y., studied at Yale, the Union Theological Seminary, and Yale Divinity School, and from 1852 to 1868 was pastor in West Philadelphia, Pa. From 1868 to 1871 he was secretary to the American and Foreign Christian Union of New York City, and from 1871 to 1873 was pastor in Brooklyn, N. Y., Eastern District. Subsequent to 1874 he was occupied wholly with literary work, in particular with the preparation of his commentary, *Bible Work* (Vol. I., 1878; Vol. VIII., 1893, incomplete). He also published *The Fourfold Gospel* (1890).

BUTLER, JOHN (?-1794). A Tory leader in the American Revolution. He was born in Connecticut, but early became a resident of Tryon County, N. Y. He commanded the Indians in Sir William Johnson's Niagara campaign of 1759, and in the Montreal expedition of 1760; joined the British at the beginning of the Revolution, and led many Indian and Tory expeditions against the frontier settlements, making himself notorious by his numerous cruelties and atrocities. At the battle of Oriskany (q.v.), in 1777, he commanded a company of Indians and Tories organized by himself, and in 1778 led the force of 1100 which devastated the Wyoming Valley and massacred the inhabitants. (See WYOMING VALLEY.) He fought against Sullivan in 1779, when that officer made his famous expedition against the Iroquois in New York, and the following year engaged in Sir John Johnson's raid against the Schoharie and Mohawk settlements. At the close of the war he settled in Canada, where, until his death, he was an agent for Indian affairs.

BUTLER, JOSEPH (1692-1752). An English theologian, born at Wantage, in Berkshire. With a view to the ministry of the Presbyterian Church, he attended a Dissenting academy at Tewkesbury, in Gloucestershire. At the age of 22 he gave proof of high metaphysical ability in a letter to Dr. Samuel Clarke, usually appended to that celebrated writer's *a priori* demonstration, to which it offers some objections. About this time he made up his mind to join the Church of England, and in March, 1714, entered Oriel College, Oxford. In 1718 he graduated, took orders, and was appointed preacher at the Rolls Chapel, where he preached those remarkable sermons which he published in 1726. The first three, "On Human Nature," constitute very important contributions to moral science. Against hedonism (q.v.) he urges that before one can find pleasure in an object one must have a disinterested desire for the object. Hence, disinterested benevolence is possible. Indeed, it is one among many impulses of human nature, which is a system of impulses, each having its own right. Butler sometimes represents conscience as the supreme regulative principle, controlling all the other impulses; sometimes reasonable self-love and benevolence are coördinate and harmonious supreme principles; sometimes to self-love is attributed the final word in the (for him impossible) case of a conflict between self-love and benevolence. Just what conscience is for Butler it is hard to ascertain. In 1725 Butler was presented to the rich benefice of

Stanhope in the county of Durham, to which he removed in the following year. Here he resided in great retirement till 1733. Thomas Secker, afterwards archbishop, desired to see him promoted to some more important position, and mentioned his name once to Queen Caroline. The Queen thought he had been dead, and asked Archbishop Blackburne if it were not so. "No, madam," said the Archbishop, "but he is buried." In 1733 Butler became chaplain to his friend, Lord Chancellor Talbot, and some time afterwards a prebendary of Rochester. In 1736 he published *The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature*. Although the argument is ingenious, and for a century and a half has been praised in the highest terms, it cannot be said to have any logical value. The leading aim of the *Analogy* is to show that all the objections to revealed religion are equally applicable to the whole constitution of nature, and that the general analogy between the principles of divine government, as revealed in the Scriptures, and those manifested in the course of nature, warrants the conclusion that they have one Author. Soon after the publication of this work, Butler was appointed Clerk of the Closet to the Queen, who greatly prized his conversation. In 1738 he was made Bishop of Bristol; in 1740, Dean of Saint Paul's; and in 1750 he was translated to the see of Durham. He lived to make but one visitation of his diocese. His 'charge' on the occasion, in which he emphasized the importance of a due maintenance of the externals of religion, subjected him to much censure as betraying a tendency to Roman Catholicism. In character Butler was grave and judicious, meek and generous. His intercourse with his clergy and people was frank and humane, and his episcopal treasures were wisely and munificently distributed. His works, with a *Life* by Kippis and notes by Halifax, were collected and published at Edinburgh (1804), and reprinted at Oxford (1807): a sumptuous edition, with 'studies,' was published by W. E. Gladstone in 1896. There are good separate editions of the *Analogy* and of the *Three Sermons*. Consult: Collins, *Butler* (London, 1889); Lefevre, "Significance of Butler's View of Human Nature," in *Philosophical Review* for 1899.

BUTLER, MATTHEW CALBRAITH (1836—). An American soldier and politician. He was born in South Carolina, and spent two years at the State University. He entered the Confederate Army as a captain, in 1861, and attained the rank of brigadier-general in 1862 and of major-general in 1863. In 1863, at the battle of Brandy Station, he lost his right leg. He was elected to the State Legislature in 1866, was a candidate for Lieutenant-Governor of South Carolina in 1870, and from 1877 to 1889 was a Democratic member of the United States Senate. In 1898 he was appointed major-general of volunteers for service in the Spanish-American War, and in the same year was a member of the commission appointed to arrange for the evacuation of Cuba by the Spanish forces.

BUTLER, NICHOLAS MURRAY (1862—). An American educator. He was born in Elizabeth, N. J., graduated at Columbia in 1882, and was

fellow in philosophy there from 1882 to 1884. He then spent a year in study in Berlin and Paris; returned to Columbia University as assistant in philosophy in 1885; and, after holding various minor positions there, became professor of philosophy, ethics, and psychology, and first dean of the faculty of philosophy in 1890. In 1887 he organized and became the first president of the New York College for the Training of Teachers (now Teachers College, Columbia University). In 1891 he founded the *Educational Review*, of which he has since been editor; and, in addition, he has edited the *Great Educators Series*; the *Teachers' Professional Library*; and the *Columbia University Contributions to Philosophy and Education*. In 1894 he was elected president of the National Educational Association, and on the resignation of Seth Low from the presidency of Columbia in 1901, he became acting president, and soon afterwards was regularly chosen as president of the university. He is the author of a great many addresses, papers, essays, and reviews, some of which have been collected in a volume, under the title, *The Meaning of Education* (1898).

BUTLER, PIERCE MASON (1798-1847). An American soldier and politician. He was born in South Carolina, entered the army as second lieutenant of infantry in 1819, and became captain in 1825. He resigned his commission in 1829, and was president of a bank in Columbia, S. C., from 1829 to 1836, but served as lieutenant-colonel during the second Seminole War. He became Governor of the State in 1838, and after the expiration of his term was Indian agent until the beginning of the Mexican War. He then was appointed colonel of the Palmetto Regiment, and in this capacity served with great gallantry in several engagements, but was killed at the battle of Churubusco, August 20, 1847.

BUTLER, REUBEN. The husband of Jeanie Deans, in Scott's novel, *The Heart of Midlothian*; a Scotch minister and 'a pair creetur.'

BUTLER, SAMUEL (1612-80). An English satirist. He was baptized at Strensham, Worcestershire, February 8, 1612, and educated at the Worcester Grammar School. It is a tradition that he also attended one of the universities, most likely Cambridge. When a young man he entered the household of the Countess of Kent, where he became acquainted with Sel-den. He also studied painting at this time. Leaving the service of the Countess, he became attendant to a succession of country gentlemen. During this period he wrote much of *Hudibras*, the hero of the poem being one of his masters—Sir Samuel Luke, of Cople Hoo, near Bedford. In 1660 he was made secretary to the Earl of Carbery, who appointed him steward of Ludlow Castle. Soon after he married a woman of good family and some property, which, however, was lost in bad securities. He published the first part of *Hudibras* in 1663, and its reception at Court was immediate and triumphant. Then the coffee-houses and taverns took up the poem. Though the King had wit enough to see the merit of the work, he lacked generosity to relieve the necessities of the writer. Poverty is almost the only thing in Butler's life that one is certain of. In 1664

he published the second part of his book, and a third part appeared in 1678. He died in Rose Street, Covent Garden, September 25, 1680.

Hudibras is a kind of metrical *Don Quixote*. The Puritans are the subject of ridicule, and King Charles must have felt that the poet avenged for him the battle of Worcester. Butler thinks in witty couplets, he argues in them, he spears his foes with a jest, he routs and chases them into oblivion with inextinguishable laughter. His best things have become proverbs. In 1759 appeared *The Genuine Remains, in Prose and Verse, of S. Butler* (London), which contains a series of character sketches and much brilliant satire in the manner of *Hudibras*. Consult: The new edition of *Hudibras*, in Morley's Universal Library (London, 1894); and *Poetical Works*, edited by Johnson (London and New York, 1893).

BUTLER, WALTER (?-1634). An Irish soldier in the Austrian service. He rose to be a colonel of dragoons in the army of Wallenstein, in whose murder he was an accomplice. (See *WALLENSTEIN*.) Subsequently he distinguished himself at Nördlingen. He appears in Schiller's *Wallenstein*.

BUTLER, WILLIAM ALLEN (1852—). An American lawyer and satirical poet. He was born in Albany, N. Y., February 20, 1825, the son of Benjamin F. Butler (1795-1858), a prominent New York lawyer and politician. He studied law in his father's office, and became a successful lawyer, finding time, however, to contribute papers and poems to various magazines. He is best known for his satire entitled "Nothing to Wear," published anonymously in *Harper's Weekly* in 1857. This was widely circulated and was translated into French and German. It has recently (1899) been republished, with others of his poems. Mr. Butler first collected his poems in 1871; he has also written quite a number of prose works, among them a sketch of Martin Van Buren (1862); and *Domesticus*, a story dealing with the labor question (1886).

BUTLER, WILLIAM ARCHER (c.1814-48). An Irish moral philosopher and clergyman of the Established Church. He was born at Annervel, and was at first educated as a Roman Catholic, but became a Protestant, and graduated at Trinity College, Dublin, where he was subsequently scholar in 1834-36. In 1837 he was appointed professor of moral philosophy at Trinity College, and having been at about the same time ordained as a clergyman, received the prebend of Clonelhorka, and in 1842 the rectorship of Raymoghly. His best-known works are the *Sermons, Doctrinal and Practical* (1849), and the eloquent *Lectures on the History of Ancient Philosophy* (1856).

BUTLER, Sir WILLIAM FRANCIS (1837—). A British soldier, born in County Tipperary, Ireland. He was privately educated, entered the army, and rose to be lieutenant-colonel in 1860. He served in the Ashanti War (1870), the Zulu War (1879), and the war in the Sudan (1884-85), and commanded the English troops at Alexandria in 1890-93. In 1898 he was in command of the army in South Africa, and, in 1899-1900, of the troops of the Western District. He was promoted in 1900 to be lieutenant-general, and was appointed commanding officer at Alder-

shot. He has published *The Great Lone Land* (1872); *Far and Out* (1880); *Charles George Gordon* (1889); a life of *Sir George Pomeroy Colley* (1899); and other works.

BUTLER, WILLIAM MORRIS (1850—). An American physician. He was born at Maine, N. Y., studied at Hamilton College and the New York College of Physicians and Surgeons, and in 1874 became connected with the State Homeopathic Hospital at Middletown, N. Y. In 1883 he began practice in Brooklyn, N. Y., where he was appointed visiting physician of the Homeopathic Hospital and consulting physician of the Memorial Hospital. He became, also, professor of mental and nervous diseases in the Metropolitan Postgraduate School of Medicine, New York City. His publications include *Home Care for the Insane*.

BUTLER, WILLIAM ORLANDO (1791-1880). An American soldier and politician. He was born in Jessamine County, Ky.; early removed with his parents to Bullitt County; and in 1812 graduated at Transylvania University. On the outbreak of the War of 1812 he joined a company of Kentucky volunteers, and subsequently participated in the engagements of January 18 and January 22, 1813, on the river Raisin. (See *FRENCHTOWN*.) He was held for some time as a captive, but afterwards took an active part, as captain, in the engagement at Pensacola, in that of December 23, 1814, at New Orleans (for which he was brevetted major), and in the famous battle of New Orleans, on January 8, 1815. In May, 1817, he resigned from the service and returned to Kentucky, where he became a successful lawyer and politician. He served for three consecutive terms after 1817 in the State Legislature, and from 1839 to 1843 was a member of Congress. In 1844 he was Democratic candidate for Governor of the State, and, though defeated, reduced the Whig majority from 28,000 to something over 4000. He was appointed major-general of volunteers in June, 1846, for service in the Mexican War; joined General Taylor soon afterwards; took a prominent part in the northern campaign, distinguishing himself particularly at Monterey, where he was wounded; joined General Scott at Mexico City, with a considerable reinforcement; and participated in the final operations of the southern campaign. On February 18, 1848, nine days after the signing of the preliminary treaty with Mexico, and about three months before the proclamation of peace (on May 29), he superseded Scott as commanding general of the American Army. On August 15, 1848, he again left the service, and in the Presidential campaign of that year he was the Democratic candidate for Vice-President on the ticket with General Cass. Subsequently, until his death, he lived almost wholly in retirement, though in 1861 he attended the celebrated 'Peace Conference' at Washington. He published a collection of poems entitled, *The Boatman's Horn, and Other Poems*. For his life, consult Blair, *The Life and Public Services of General William O. Butler* (Baltimore, 1848).

BUTLER, ZEBULON (1731-95). An American soldier. He was born in Connecticut, served in the French and Indian War of 1755-63, and settled at Wyoming, Pa., in 1769. He was lieutenant-colonel of the Connecticut troops in New

Jersey in 1777-78, commanded the garrison of Fort Mifflin at the time of the Wyoming massacre (see *WYOMING VALLEY*), and in 1779 served in Sullivan's expedition against the Indians.

BUTLEROFF, *büt'ler-öf*, **ALEXANDER MIKHAILOVICH** (1825-86). A Russian chemist. He was born at Tshistopol (Government of Kazan) and was educated at the University of Kazan, where, in 1858, he was appointed professor of chemistry. He also held the position of rector at that institution. In 1868 he was called in the same capacity to the University of Saint Petersburg. Besides publishing a valuable work on the general principles of organic chemistry, Butleroff carried out a number of interesting original investigations. His best-known contribution to science was the discovery of the so-called tertiary alcohols (see *ALCOHOLS*), and of a general method by which the substances of this class may be readily prepared ('Butleroff's reaction'). His scientific papers may be found in the publications of the academies of Saint Petersburg and Paris, and in Liebig's *Annalen*. Butleroff was a strong believer in spiritualism, and even published a work in French on this subject, entitled *Etudes psychiques*.

BUTO (Gk. *Bourá, Boutó*). The Greek form of the Egyptian *Pe(r)-Uzoy(t)* (House of Uzoyt), the name of a city which, in prehistoric times, seems to have been the capital of Lower Egypt. The goddess Uzoyt, from whom the city took its name, was the patroness of the Delta. She is represented in the form of a serpent, and was identified by the Greeks with Latona. The city of Buto appears to have been situated on an island of the modern Lake Burlos, but the exact location is unknown.

BUTON, *büt'ton*, **BOETON**, or **BUTUNG**. An island of the Dutch East Indies, situated southeast of Celebes, from which it is separated by Buton Strait. It is included between latitudes 4° 25' and 5° 45' S. and longitudes 122° 32' and 123° 30' E. Area, about 1700 square miles. It has an elevated surface and is fertile and thickly wooded. It is an administrative dependency of Celebes, but is governed by a native chief under a Dutch resident. The chief town is Buton, at the southwest extremity of the island. Population, estimated at 100,000, chiefly Malays.

BÜTSCHLI, *büt'shlé*, **OTTO** (1848—). A German zoölogist, born in Frankfort-on-the-Main. He studied at the Karlsruhe Technical School and at the University of Heidelberg, became a lecturer at the former (1876-78), and in 1878 was appointed professor of zoölogy at the latter. His early researches concerned the history of the evolution of gasteropods, worms, and insects, and the anatomical structure of the nematodes and other worms. In his "Studien über die Zellteilung und die Konjugation der Infusorien" (in Vol. X. of the *Abhandlungen* of the Sneckenberg Society, 1876), he was a pioneer in establishing modern scientific knowledge of nucleus and cell division. His studies of the constitution of protoplasm and the structure of bacteria have aroused wide scientific interest and discussion. His publications include an important volume on the "Protozoen" (constituting Vol. I. of Bronn's *Klassen und Ordnungen des Tierreichs*, 1880-89); *Untersuchungen über mikroskopische Schäume und das Protoplasma*

(1892); and *Untersuchungen über die Mikrostruktur künstlicher und natürlicher Kiesel-säuregallerten* (1900).

BUTT, ISAAC (1813-79). An Irish politician. He graduated at Trinity College, Dublin, in 1835; was professor of political economy there from 1836 to 1841, and became a member of the Irish bar. He was one of the counsel for Smith O'Brien and others tried in 1848 for treason, and also for the Fenians tried in 1865. In 1852 he was chosen to Parliament from Youghal as a Liberal Conservative; and in 1871 was returned from Limerick, and was for many years leader of the Home Rule Party. He was one of the projectors of the *Dublin University Magazine*, of which he was editor from 1834 to 1838. Among his published works are a *History of Italy* (1860), and *The Problem of Irish Education* (1875).

BUTTE, büt (Fr., mound, hillock, elevation; cf. Engl. *butt*). A hill or knoll rising abruptly above the surrounding level. Buttes abound in the Rocky Mountain region. Often the name is applied to high mountains, as the Downieville Buttes, Sierra County, Cal., which are over 8500 feet.

BUTTE. A city and county-seat of Silverbow County, Mont., on the western slope of a range of the Rocky Mountains, and on the Oregon Short Line, the Northern Pacific, the Great Northern, and the Montana Union (owned by the Northern Pacific) railroads (Map: Montana, C 2). It has a healthful location at an altitude of 5800 feet, is the seat of the State School of Mines, and contains a fine public fountain, a public library of about 30,000 volumes, a private academy, and, among the more notable buildings, the jail and court-house, the high school, completed at a cost of \$125,000, city hall, and opera house. The famous Anaconda Copper and Silver Mine is located here, and within a radius of a few miles are many other productive gold, silver, and copper deposits, the industries of the city centering almost entirely in the mines. In copper, the production of Butte is placed at about one-half of the entire output of the United States, and the amount of gold and silver mined is also considerable, the value of the annual production of these three minerals being estimated at nearly \$50,000,000. Besides the mines, there are immense mills and smelting-works. The government is vested in a mayor, biennially elected, and a city council. Butte spends annually in maintenance and operation over \$500,000 (including amounts for the school district extending beyond the municipal limits); the principal items of expenditure being about \$190,000 for schools, the district, as above stated, comprising more than the city limits, \$60,000 for the fire department, \$55,000 for the police department, \$40,000 for street cleaning and sprinkling, and \$20,000 for municipal lighting. Butte was settled in 1864, and laid out in 1866, but its prosperity dates from the successful operations in quartz mining in 1875. It was incorporated first in 1879 by an act of the Territorial Legislature, and in 1888 was reincorporated. In 1881, upon the creation of the county, Butte was chosen the county-seat. Population, in 1870, about 350; in 1880, 3363; in 1890, 10,723; in 1900, 30,470.

BUTTER (Lat. *butyrum*, Gk. [from Scythian, probably] *βούτυρον*, *boutyron*, from *βούς*, *bous*,

cow + *τυρός*, *tyros*, cheese). A substance made from the fat of milk or cream by churning and working to separate the water and other constituents. It has been known since a period prior to the beginning of the Christian Era, being used as food to some slight extent in early days, but mostly as a medicine and as an ointment after bathing, and sometimes for burning in lamps in the place of oil. The Greeks probably derived their knowledge of it from the Scythians or Thracians, and the Romans from the Germans. Butter was first made from the milk of sheep and goats, and later from that of cows. It was churned in a very crude manner in skin bags or pouches and was evidently a very inferior article. It was not solid, but liquid, and is always spoken of as being poured out. The manufacture and use of butter as a staple article of food is comparatively recent, and in southern Europe it is still sparingly used, being replaced in great measure by olive and other oils. In the art of butter-making the Danes have long occupied a foremost place, and Danish butter brings at present a higher average price than that made in any other country. Denmark has become the leading butter-exporting country of the world, surpassing France, which formerly led in this respect. The exports of Danish butter in 1899 reached 160,143,255 pounds, valued at \$34,575,634. In the United States the production of butter has made rapid growth since the introduction of the creamery system, and a product of high quality is now made. According to the statistics of the United States Department of Agriculture, the amount produced in 1899 was 1,430,000,000 pounds, valued at \$257,400,000.

Butter may contain a small quantity of salt added to make it more palatable and to aid the keeping qualities, or it may be fresh (unsalted, as demanded by the taste of the consumers. Unsalted or slightly salted butter is consumed largely in England and in some parts of Europe, and the European countries in general salt their butter to a less degree than is customary in America. The natural color of butter is a golden yellow, varying in intensity with the feed, the animal, and the stage of lactation. To make the color more uniform throughout the year, a little coloring matter is commonly added in the making, usually some artificial butter-color (q.v.). The demand of different markets varies considerably in regard to the shade of color desired. Some South American countries prefer a deep orange or red color, and butter prepared for export to those countries is colored in accordance with this taste. The other qualities taken into account in judging butter are the flavor, texture or grain, and the 'finish' or general appearance. The flavor usually counts 40 or 45 points on a scale of 100. It is largely a matter of individual judgment, the high flavor preferred by some verging on rancidity, while others prefer a mild, delicate flavor. The characteristic flavor should be well pronounced, and there should be an absence of rancidity or any extraneous flavors. The texture is the appearance when the mass of butter is broken in two or when a knife or trier is passed through it. Under this term is also implied the hardness or firmness.

The composition of butter varies considerably with the process and the conditions of manufacture. According to the most reliable data available it may be said to be approximately as fol-

BUTTER-MAKING

THE OLD WAY.

THE NEW WAY.

lows: Water, 11 per cent.; fat, 85 per cent.; protein (curd), 1 per cent.; and ash (mostly salt), 3 per cent. The average of over 350 butter analyses made during the World's Fair Dairy Test at Chicago was: Water, 11.57; fat, 84.7; curd, 0.95; and salt, 2.78 per cent. By far the most variable constituent is water, and its proportion very largely determines the percentage of fat in butter. The water content is quite largely within the control of the maker. It may run as high as 20 or 25 per cent., and even to 45 or 50 per cent. in very exceptional cases. In such cases, however, it has either been intentionally incorporated, or left there through carelessness, and is in the nature of an adulteration. There seems no good reason why, with proper making, butter should contain over 15 per cent. of water or less than 80 per cent. of fat, and this has been accepted as a standard in some places.

The most common adulterant of butter is, of course, oleomargarine (q.v.). Unfortunately, the detection of this with absolute certainty is a difficult matter, especially when the proportion is not large. This is on account of the variations in the volatile, fatty acids, in the saponification equivalent, and in other factors of normal butter, due to the feed, to the breed of cows, and to the stage of lactation. The extent to which adulteration is practiced has thoroughly aroused the dairymen, and it is responsible for the agitation against oleomargarine as a food product. Cottonseed and other oils have been used for adulterating butter, and attention has recently been called to the use of glucose as an adulterant of butter put up for export to South America, the makers claiming that the glucose was added as a preservative. A variety of preservatives have been used in butter, especially in inferior butter or in that intended for long shipment. The most usual are mixtures of borax and boric acid. Such preservatives are usually regarded as adulterants.

'Renovated' or 'process' butter is butter of inferior quality which has been treated by mechanical and chemical processes to remove the disagreeable taste and odors, and to eliminate its rancidity, and then incorporated with a quantity of milk or cream to give the mass a semblance of grain and flavor. A great deal of poor country butter is worked over in this way, and considerable of this is sold as good creamery butter, of which it is a fair imitation while fresh. Although it does not contain any excessive amounts of water or curd, it may well be doubted from its history whether as a food product it is as good as average butterine or oleomargarine.

FOOD VALUE. Butter is used as an article of diet, as a fat for frying, and as one of the ingredients of a large number of foods. Like other edible fats, it is a source of energy in the diet. Of the 0.17 to 0.33 pound of fat required per man per day, according to the amount of work performed, a considerable part may be furnished by butter, since experience has demonstrated that no fat is more wholesome. In 185 American dietary studies, it was found that butter furnished, on the average, 1.9 per cent. of the total food and 19.7 per cent. of the total fat of the daily food.

Butter is very thoroughly assimilated, the coefficient of digestibility of butter-fat being 98 per cent. or over.

Fresh and salt butter are equally wholesome. Clarified butter is used for a number of culinary purposes. It is prepared by heating the butter until all frothing and deposition of casein has ceased, and the liquid has become clear and free from water. The butter made in India from sour milk and called *ghee* (q.v.) is often clarified.

BUTTER, ARTIFICIAL. See OLEOMARGARINE.

BUTTER-AND-EGGS. See TOADFLAX.

BUTTERBUR. See TUSSILAGO.

BUTTER-COLOR. An artificial preparation used for coloring butter and imitation products, to give them the desired golden-yellow hue. Butter is colored to give the product a more uniform appearance throughout the season, and when butter from a number of factories or dairies is 'blended' it is necessary to color it to prevent its being streaked. There are a variety of butter-colors on the market. Annatto was formerly the active principle of most of them, but of late it has been replaced to some extent by coal-tar colors, such as anilin yellow and butter yellow. Other coloring matters occasionally employed are turmeric, saffron, marigold-leaves, carrot-juice, and chrome yellow. The coloring matter is usually dissolved in some oil. The preparations are usually of such strength as to require the addition of only small quantities to the cream to produce butter of the desired color. Experiments have indicated that in the small proportions in which they are present in butter, they are generally entirely harmless.

BUTTERCUP. See RANUNCULUS.

BUTTERFIELD, DANIEL (1831-1901). An American soldier. He was born in Utica, N. Y., graduated at Union College in 1849, and subsequently engaged in the transportation and express business. In April, 1861, he entered the Federal Army as colonel of the Twelfth New York Militia, and soon afterwards commanded a brigade in Patterson's ineffective campaign in Virginia. He was raised to the rank of brigadier-general of volunteers in October, 1861, and commanded a brigade in the Fifth Corps of the Army of the Potomac during the Peninsular campaign. He took part in nearly all the engagements, was wounded at Gaines's Mill, and in the second battle of Bull Run commanded a division under Pope. In November, 1862, he was appointed major-general of volunteers. He commanded the Fifth Army Corps at Fredericksburg, and at Chancellorsville and Gettysburg was chief of staff under Hooker and Meade respectively. In October, 1863, he joined the Army of the Cumberland, and, as chief of staff to Hooker, participated in the battle of Chattanooga. He then commanded a division of the Twentieth Corps in Sherman's Georgia campaign, and at the close of the war was brevetted brigadier-general and major-general in the United States Army for "gallant and meritorious conduct in the field." He was in command at New York City from 1866 to 1869, when he resigned from the service; and from 1869 to 1870 was United States sub-treasurer there. In 1889 he organized and commanded the great Washington centennial parade in New York City, in which over 100,000 men participated. He wrote: *A System of Calls, Picket and Outpost Duty, Corps Badges and Flags* (1862).

BUTTERFISH (for origin of name see below). Any of several fishes. The best known is a blenny (*Muraenoides gunnellus*), about 12 inches long, olive-brown in color, with obscure bars and spots, called also 'gunnell' and 'rock-eel.' It is abundant in the North Atlantic. (See GUNNELL.) In New York and Massachusetts the name applies to one of the harvest-fishes of the Stromateidæ, allied to the mackerels. It is oval, about 10 inches long, bluish above and silvery below, and known to science as *Rhombus triacanthus*. It owes its name to the butter-like feeling of its surface, and it is highly esteemed as food. Lafayette, harvest-fish (referring to the time of its appearance), and dollar-fish (due to its roundish form and silvery hue), are other local names. Similar species belong to the north-west coast. A third 'butterfish' is a small yellow or reddish serranid (*Epinephelus punctatus*) of Florida and the West Indies—one of the groupers (q.v.); and a fourth is a popular long-fin (*Chilodactylus nigricans*). See LONGFIN; HARVEST-FISH.

BUTTERFLIES and **MOTHS** (the name is probably due to the popular belief that it steals butter and milk; or it may refer to the color of the excrement; cf. M. Dutch *boterschijte*, *schete*). Insects of the order Lepidoptera which are not separable by any distinct line of structural characters. (See LEPIDOPTERA.) They agree in essentials and their popular separation is a practical rather than a natural one. Perhaps the nearest we may come to a definite distinction is to call *butterflies* all those Lepidoptera whose pairs of wings are never fastened together in flight; and call *moths* all those whose wings are so united.

"The popular division of Lepidoptera into 'butterflies' (*Rhopalocera*) and 'moths' (*Heterocera*) is quite unscientific, the butterflies being more nearly related to the higher moths than these to the lower moths. It has been proposed to separate the three lowest families which have . . . a jugum on each fore wing, as Jugatæ, from all other Lepidoptera—Frenatæ; also to divide the families with incomplete pupæ (*Incompleteæ*) from those with obtect pupæ (*Obtectæ*); also to separate the lowest family on account of the structure of the first maxillæ as a suborder (*Laciniata*) distinct from all other families (*Haustellata*). On the whole, it is better not to adopt any division of the Lepidoptera between the order and the family." G. H. Carpenter, *Insects* (New York, 1899).

Butterflies, as a rule, go abroad in the daytime, seeking no concealment, and are brightly colored, while moths more usually fly in the twilight or at night, and are subdued in hue. Butterflies are distinguished by the terminal knob (or occasionally hook) of the antennæ, whence the common group-name *Rhopalocera*, while the antennæ of moths (*Heterocera*) are usually otherwise in form, often filiform or feathery. Butterflies have the habit of holding the wings in a vertical position over the back when at rest, while moths usually keep them flat.

Of the Lepidoptera represented in North America, the following families may be called *butterflies*: Hesperiidæ, Lyceidæ, Lemoniidæ, Nymphalidæ, and Papilionidæ; and all the rest *moths*, among which the Pterophoridæ, Tineidæ, Tortricidæ, Pyralidæ, Geometridæ, Noctuidæ, Bombycidæ, Zygaenidæ, Pieridæ, and Sphingidæ

are most important. Other families of both sorts belong only to South America or the Old World.

STRUCTURE. The head in this group is distinct from the thorax, clothed with hairs, and bears large, compound eyes, and moths have also simple eyes (*ocelli*). The antennæ are always present, and important not only as feelers, but as organs of hearing and smell (see INSECT), the latter service being probably a very important one in this group. These antennæ take various shapes. Among butterflies they are thickened at the end, sometimes into a rounded club, but more often into a spindle-shape terminating in a bent point. Of the moths "some have thread-like antennæ tapering to a fine point; others have feather-shaped antennæ; others still have antennæ which are prismatic in form, and provided with a little hook or spur, at the end; and there are many modifications and variations of these forms." The shape, or at least the size, usually varies between the sexes, being larger in the male than in the female—a fact connected with his duty to search for her, and especially observable in moths. The same may be said of the eyes, which, in the nocturnal species, cover the whole side of the head and have an enormous number of facets—27,000, it is said, in some hawk-moths.

The mouth in the Lepidoptera is modified into a sucking-organ, enabling this insect to feed on the nectar of flowers and the sap of trees and plants. The mandibles are rudimentary or absent, and the maxillæ, by a very extraordinary development and modification, are formed into a sucking-tube, called the proboscis; which, when not in use, is coiled up between two forward-projecting organs, the labial palpi. It is "composed of three distinct hollow tubes, soldered to each other along their inner margins," and "has much the appearance of a double-barreled gun, with a third tube lying below." Nutrition is imbibed through the lower or central tube, by a regular pumping, produced by the alternate muscular pinching and loosening of a bulb-like arrangement in the head; and the other tubes admit air. In some of the sphinx-moths the proboscis may be ten inches long, and in others its tip is armed with spines which serve to break or cut the surface of fruits, the juice of which is sucked up.

Wings.—The thorax bears the legs and wings. The former are weak and are merely used as organs of support when the insect is at rest, and the front pair of legs may be short or rudimentary, as is the case in *Vanessa*. The four membranous wings are usually large in comparison with the size of the body; expanse of wing and strength of flight, however, are not exactly correlated, for some of the hawk-moths with proportionately small wings are the most enduring flyers, yet the large-winged forms probably fly with less exertion. In actual size lepidopterans vary from almost microscopic species, hiding in the moss, to tropical monarchs 12 inches in expanse. These transparent membranes are supported by a framework radiating from the thoracic joints, which consist of double horny tubes (veins or 'nerves' and nervules) one within the other, the inner being filled with air and the outer with nutritive fluids. "These 'nerves,' as custom will persist in terming them, in the butterflies, take a bow-like or ellipsoidal sweep from the base of the wing, forming what is the 'discoïdal cell,' whence there branch off to the edges a

series of horizontal, almost parallel, slightly divergent nervules. On the position of these the identification of species is most securely based.

In the moths, on the other hand, the discoidal cell is less conspicuous." The names of the parts of the wing, and of its veins and nervules, used by entomologists in their descriptions of species, are given in the accompanying illustrations. To further increase the power of the pinions, the pair on each side are made to act as one. This adjustment is effected either by an overlapping of the hind wing by the front wing (butterflies or some of the larger moths) or the posterior wing possesses a 'frenulum,' composed of one or more bristles, which fits into a 'retinaculum,' a membranous flap or a bunch of scales on the anterior wing (other moths). According to Hampson, "the form of the frenulum is of use in determining sex, as in the males of all the forms that possess it it consists of hairs firmly soldered together so as to form a single bristle, while in nearly all females it consists of three or more bristles, separate and shorter than that of the male."

Scales.—The wings of all Lepidoptera, as the word implies, are clothed more or less completely with scales, which are modified hairs—hairs that are very short and much widened; and every gradation may be found, in a species like *Ithomyia*, between the hairs on the body and wings and the scales. They are like small chitinous bags with the sides pressed together, and each one has on its proximal end a short stalk which fits into a cavity of the wing-membrane. They are of various shapes, notched on the posterior margin, striated, etc., and "the males of many species have peculiarly shaped scales arranged in tufts and folds, which are called 'androconia,' and are useful in microscopically determining species." The scales are in rows, and overlap much as do the scales on a fish or the shingles on the roof of a house. They rub off easily, and entomologists know how to remove them without serious injury; but when taken from a living insect they diminish or destroy its ability to fly. They number hundreds of thousands, and their use is to strengthen the membranous wings, and when they overlap the wing-membranes at the edges to a considerable extent, as occurs in some cases, they also increase the wing-area. Another use is to bear the colors of the wings, for when the scales are removed the color is gone. This color is due either to pigment contained within the scale or its walls, or to the fine striations on the upper surface which give rise to metallic 'interference colors.' Both albinism and melanism occur. The pigments are perhaps in the nature of biliary excretions, such as urates from nitrogenous matter and melanins from carbonaceous matter.

Distinctions of Sex.—The abdomen is composed of segments, nine for the female and ten for the male, and contains the viscera, and the lateral spiracles by which air is admitted to the respiratory system. It is shorter in most butterflies than the hinder wings; and in most moths is tufted along the dorsal line and on the end. The terminal segment has various appendages, and contains the sexual organs of both sexes. There is often a very striking difference in size, color, and form between the females, especially among the butterflies, where procreation may be the sole duty of the imago during its brief sum-

mer existence. In case there are several broods of butterflies in a season, each brood may have its characteristic coloration. Our *Ajax* butterfly is three-brooded, and before the facts of its life-history were known, each brood had been given a specific name. By artificially varying the temperature or moisture, any or all the seasonal forms may be produced at will from one and the same laying of eggs. The males, which are usually more gayly decorated than the females and exceed them in number, are continually in search, about the food-plants, of mates, who exert a far-reaching attracting power. Collectors utilize this instinct: having caught a female they expose it in a cage and soon are likely to find several males flocking about it. Under certain circumstances eggs may be laid by an unfertilized female, for which see REPRODUCTION—*Parthenogenesis*. Adherents of the doctrine of sexual selection believe the female exercises a choice among these assembled suitors, selecting for her partner the best, according to the standard of the species, and so maintaining the high quality of the race. A single impregnation is sufficient, and the impregnated females soon begin to lay eggs, having accomplished which, they die, in the great majority of cases, the exceptions being those which are double-brooded, or (a very few) where the adults largely survive the winter.

HIBERNATION AND MIGRATION. A few butterflies, such as the mourning-cloak, are able to endure in a state of torpidity the winters of the north. A large number winter over as pupæ, and others, like the brown and black *Isabella* caterpillar, as well-grown caterpillars. Others hatch out only in time to go into winterquarters. Many winter over as eggs, and not a few in two different stages, the latter having a double chance of surviving. It has been established by at least one set of careful observations that the cabbage butterfly (see CABBAGE INSECTS) of southern Europe migrates or flies in a general southerly direction in the fall and northerly in the spring. In the United States the milkweed butterfly (q.v.) sometimes so migrates in enormous swarms. Such migrations are even more common in the tropics. In his work on Ceylon, Sir James Tennent writes of "the extraordinary sight of flights of these delicate creatures, generally of white or pale yellow hue, apparently miles in breadth, and of such prodigious extension as to occupy hours and even days uninterruptedly in their passage." These migrations are at times occasioned by lack of food-plants on which to deposit eggs. In other cases we know they are seasonal. By going south the butterflies find a climate in which they are able to winter.

REPRODUCTION AND METAMORPHOSIS. The eggs of all Lepidoptera are laid on or near the food-plant, that is, the plant upon which the young must feed. In number they vary from less than one hundred to several thousand, and are deposited continuously and rapidly, as a rule. They may be placed singly, as is common among butterflies, or, as is more usual among moths, in clusters or masses, adhering to their support and perhaps to each other by a glutinous coating; while some moths prepare a sort of nest of hairs plucked from their bodies upon and within which the eggs rest, or otherwise protect them from observation or the weather, especially those destined to last through a northern winter

or tropical season of drouth. Their membranous shells take various forms, and are often exceedingly beautiful when seen through the microscope. "Some," says Holland, "are spherical, others hemispherical, conical, and cylindrical. Some are barrel-shaped, others have the shape of a cheese, and still others have the form of a turban. Many of them are angled, some depressed at the ends. Their surface is variously ornamented. Sometimes they are ribbed . . . [and] between these ribs there is frequently found a fine network of raised lines variously arranged. . . . As there is great variety in the form of the eggs, so also is there great variety in their color. Brown, blue, green, red, and yellow eggs occur. Greenish or greenish white are common tints. The eggs are often ornamented with dots and lines of darker color. . . . Fertile eggs, a few days after they have been deposited, frequently undergo a change of color, and it is often possible with a magnifying-glass to see through the thin shell the form of the embryo which is being developed within the egg." The eggs may hatch in a few days or only after months, for numerous species pass the winter or the dry season in the egg. The larva born in the egg, and which escapes by an opening, of curious structure, at the upper end of the shell, called the micropyle, is known as a caterpillar.

This larva, or 'caterpillar,' is a worm-like creature, and takes a form, color, etc., characteristic of its group and species. The term properly is restricted to lepidopterous larvæ alone, though sometimes applied to other larvæ, as those of the saw-flies. The head of the caterpillar is conspicuous, often large, and composed of horny (chitinous) material, taking various shapes. It is provided with six simple eyes (*ocelli*), usually to be seen only with the aid of a lens, which are either just above each mandible, or on each side of the head; there are two rudimentary antennæ. The mouth is adapted for tearing, cutting, and masticating the substances on which the caterpillar is destined to feed, which are very various in the different species, although in all extremely different from the food of the perfect insect; it is provided with strong upper and lower jaws; a labium, or lower lip; and four palpi. In the mouth (labium) also is situated the spinneret of those species which, when they change into the chrysalis, envelop themselves in silken cocoons. (See *SILK*.) The first three segments of the body are each furnished with a pair of short legs, which are hard, scaly, and clawed, and represent the six legs of the perfect insect; some of the remaining segments are also furnished with short feet (*prolegs*), varying in all from four to 10 in number, the last pair situated at the posterior extremity of the body; but these are membranous or fleshy, and armed at their extremity with minute hooks. Those caterpillars in which the prolegs (which are shed in the last molt) are pretty equally distributed along the body, move by a sort of regular crawling motion; but those which have only four such feet, near the posterior extremity, move by stretching the body out to its full length, taking hold by their fore feet, and then bending the body into an arch, thus bringing the hind feet forward, when the body is stretched out again for a new step, and so on; this last is the method of progression of the geometrid moths, called

loopers, inch-worms, or measurers. The larva appears to guide itself by its feelers (*palpi*). The heads of many caterpillars also have defensive spines, or arrangements for emitting noisome liquids or odors, to be referred to later.

The body of the caterpillar contains nearly all the organs of the adult butterfly or moth. Respiration goes on through nine spiracles on each side, two on each ring, except the second, third, and last. There are no external traces of sexual organs, but there arise, during this stage, the 'imaginal disks,' which develop into the wings and legs of the adult insect. These rudiments of wings exist even in very young caterpillars as a thickening and bagging in of the hypodermis. Into this bag, trachea and blood make their way. Just how these internal wings reach the outside is not known; probably by the destruction of the outside hypodermis. If the wing-membrane breaks during development, so that the blood or hæmolymp exudes, the injured wing will be smaller or deformed. Sometimes the wings fail to expand properly because they dry too soon, and a wet sponge under a bell-jar, with transforming *Lepidoptera*, will aid in the production of perfect specimens.

Feeding Habits and Mischief.—Caterpillars find themselves at birth in contact with proper food, and begin at once to devour it, and to obey certain other instincts necessary to their life and prosperity. This is the stage in which the butterfly or moth gets most of its nourishment and growth, none taking food in the next or pupal stage, and many not feeding at all, as imagoes. The great majority are vegetable-eaters, many being limited to a particular kind of plant, or to a few nearly allied plants. Some feed on flowers, some on seeds, some on roots, and some even on the woody portions of stems; some on wool, hides, furs, and other animal substances; a few on lard, and other kinds of fat. Some feed in the dark, and some in the light. Some kinds seem to eat almost incessantly, but most of them have alternate periods of ravenousness and quiescence. As many of the favorite food-plants have been cultivated by civilized man, and other substances eaten by these creatures have been made use of by him, he has multiplied by his operations the supply and consequently the numbers of certain species until they have become pests, destructive of his work and profits. It is in the caterpillar stage that almost all the destructiveness of the *Lepidoptera* is accomplished. On certain years they succeed in denuding whole forests or many fields. The cutworm, the army-worm, and the cotton-worm are well-known pests. Their voracity is remarkable. According to Trouvelot, when a *Polyphemus* caterpillar hatches, it weighs one-twentieth of a grain, and when it is 50 days old, it weighs 207 grains, and has consumed 120 oak-leaves, weighing three-fourths of a pound. "So the food taken by a single silkworm in 56 days equals in weight 86,000 times the primitive weight of the worm. What a destruction of leaves this single species of insects could make if only a one-hundredth part of the eggs laid came to maturity! A few years would be sufficient for the propagation of a number large enough to devour all the leaves of our forests."

Taken as a whole, caterpillars are economically so injurious that were it not for the great depletion of their numbers by their multitudinous

BUTTERFLIES AND MOTHS

For names and descriptions, see article "Butterflies and Moths."

foes, they would soon destroy the vegetable kingdom. They injure, or even kill, shrubs and trees, as well as all sorts of garden vegetables. They eat woolen stuffs of all kinds and furs. To offset all their destructiveness, they offer little save silk that is, at present at least, known to be useful to man. There are a few species that are helpful to vegetation, such as the *Lycenidae*, which feed on plant-lice and scale-insects. One such species (*Feniseca Tarquinius*) occurs in the United States. A few forms are aquatic and feed on plants under water.

Self-Protection in Caterpillars.—The skin of some caterpillars is naked, that of others is covered with hairs, spines, or tubercles. Most are solitary, but some make for themselves nests or tents of silk, under which they dwell in societies, protected from the inclemency of the weather. Many construct cases or sheaths by agglutinating various substances together, as the caterpillar of the common clothes-moth. Some roll together leaves, and fix them by threads, so forming a dwelling for themselves; and a few burrow and excavate galleries in the substance of leaves or in the pith of plants. Most of them are in color brown or green, while those hidden in galleries are whitish; but many carry gaudy colors and numerous ornamental or strange protuberances. All these characteristics are connected with Nature's effort to protect them from their enemies. Alfred Russell Wallace has made clear the fatality to caterpillars of even slight wounds, for "a slight wound entails great loss of blood, while a modest injury must prove fatal." Therefore devices that enable caterpillars to escape the notice or the attacks of enemies are very useful to them. Many caterpillars possess a disagreeable smell, or a nauseous taste, or both. Thus, those of the swallow-tailed butterflies "are provided with a bifurcate or forked organ, generally yellow in color, which is protruded from an opening in the skin back of the head, and which emits a powerful odor; this protrusive organ evidently exists only for the purposes of defense." Most caterpillars resist an attack by hurling their bodies violently from side to side. Others assume startling attitudes, or have a surprising arrangement of color. These terrifying attitudes may accompany disagreeable tastes and so serve more vividly to impress upon the foe the unpleasant quality of the prey. Nevertheless, as Professor Poulton has stated, hungry animals may come to eat and like distasteful caterpillars. Certain caterpillars escape the enemy by resembling the color of the background, concerning which more is to be said elsewhere. Others, such as the geometrids or measuring worms, may combine with this protective coloration the capacity of attaching themselves by the hind end and stretching out in the air like a twig. This rigid attitude they may maintain for some time. Imitation may even be carried to the length of mimicking other kinds of animals. Thus the huge eye-spots, peculiar folds, and marks on the anterior end give some forms the appearance of snakes or other strong animals. The color of caterpillars is due to two sources: (1) Pigment gained from the food; (2) Pigment inherent in the deep-lying tissues or skin. Most green caterpillars seem in some way to be colored by the chlorophyll of the food-plant. Yellow is derived mainly from xanthophyll of plants. Pigment derived from food-plants tends

gradually to give the caterpillar the coloration of the surroundings. See PROTECTIVE COLORATION; MIMICRY; etc.

Struggle for Existence.—Only a few out of the vast hosts of caterpillars ever reach maturity. Many are destroyed by cold, wet, drouth, or lack of food. Vast numbers fall prey to birds, reptiles, and mammals. Many others are caught by wasps and stored up as food for the young, or are captured by adult and larval predaceous beetles. Ichneumon flies deposit their eggs within great numbers of caterpillars, where they develop and eventually kill the caterpillar or pupa. Tachinæ also lay their eggs on caterpillars and the larvæ are parasitic within them. In addition, caterpillars are subject to fungus and various other contagious diseases which are particularly fatal to the cultivated silkworm.

Molting.—Soon after the caterpillar begins to take food and increase in size, it is obliged to shed its skin, which has become too tight. To take its place, a larger, soft one is developed beneath the old one. This new skin becomes, in its turn, too tight and unelastic, and must be shed. A number of such moltings or ecdyses take place before the embryo attains full size. These normally occur at regular intervals, and four or five molts complete the growth; but "in cases where caterpillars hibernate . . . a long interval necessarily elapses. Some Arctic species are known in which the development from the egg to the perfect insect covers a period of two or three years." The manner in which the molting is effected is very interesting. When the necessity is felt, the caterpillar ceases feeding, attaches itself firmly to some object, and becomes quiet for a time. "The process begins with a splitting of the skin on the upper surface of the thorax; this is continued forward to the head, which opens along the sutures. The head and thorax of the new stage, or 'instar', are then worked out by an energetic wriggling motion of the insect, and the old skin is gradually stripped off from before backward, like the finger of a glove. In caterpillars it is known that a fluid, secreted by glands in the hypodermis, is present at molting-times between the new and the old skin, which it helps to separate."—Carpenter.

The caterpillar may be regarded as a recapitulation of one stage in the phylogenetic development, that is to say, in the evolution of the lepidopterous insect. It may indeed be said to reproduce a stage in the phylogeny of insects best represented to-day by *Peripatus*, a primitive and widely distributed genus that serves to connect arthropods with worms.

Pupation.—After a caterpillar has passed through the period of successive feedings and moltings which the economy of its species requires, it prepares to pass into the second larval stage and become a *pupa*, in which tough integuments cover the developing organs instead of soft skin. Pupæ may cover themselves with a case of silk or other materials, called a cocoon, or may remain naked, in which case they are known as chrysalids (sing. *chrysalis*). The former is the custom among the moths—the latter among the butterflies. The insect in this stage is utterly helpless, and a cocoon serves as a protection. It is spun as the last act just before passing into the pupal stage, and is formed of silken threads, produced by the hardening of the fluid secreted by the spinning glands. These may be

wound round and round the larva until the silken case thus made suffices; or they may form merely the lining of an earthen cell (for many species pupate under ground), or they may serve to bind into the cocoon their own hairs, chips of wood, or other materials, or to tie down rolled leaves, or form a web-like network hung like a bag or a hammock from some support, or making a fuzzy mass in some crevice or among leaves and twigs. When the work of spinning the silk is once begun, it is carried on almost without cessation for several days. The forms of cocoons are various; when not concealed, they are usually of a tint that blends well with their surroundings, leaving them inconspicuous, while their material is calculated to resist the attacks of insect-eating birds and mammals, or of ichneumon-flies and other intending parasites.

Cocoons are mainly the work of moths, to which the term 'pupa' is now frequently restricted, for the butterflies pass their pupal stage incased in comparatively rigid integuments, which form a 'chrysalis.' They vary greatly in form, some being acorn-like, others very angular, etc., and most are obscure in tint, so as to be easily overlooked, but some are brilliant in color, usually of golden or metallic hues, whence the name *chrysalis*. Some butterfly chrysalids (Nymphalidæ) are simply suspended from the posterior end (*Hesperis*); those of others (Papilionidæ) are held in place by an additional strand or girdle of silk (*Succincti*). Within the chrysalis or cocoon is the immature butterfly or moth, and all the parts belonging to the future adult insect may be found by examination. Breathing goes on through air openings, and the parts steadily develop. "The pupæ of the vast majority of moths, of butterflies, and of two-winged flies have the limbs and wings not merely pressed close to the body, but immovably fixed thereto by a general hardening and fusion of the outer skin. Such pupæ are distinguished as 'obtect.' But although the limbs are incapable of motion, certain abdominal segments remain free, so that the hind body can be, to some extent, bent and turned about; and, by means of rows of spines on the abdominal segments, the pupa is, in many cases, enabled to work its way out of its shelter, when the time for the final change has arrived." Such are styled 'incomplete.' The pupal stage may be of long or short duration. Many Lepidoptera pass the winter or the tropical dry season as pupæ. Some have several broods a year, and in such the pupal stage of the hibernating brood will last longer than that of the others.

The Imago.—When the pupa has arrived at maturity, its coverings split and allow the emergence of the 'imago' or perfect insect. "Hardly anything in the range of insect life," remarks Dr. W. J. Holland, "is more interesting than the rapid development of the butterfly after its first emergence from the chrysalis. . . . The imago, as it first emerges, is provided with small, flaccid wings, which, together with all the organs of sense, such as the antennæ, require for their complete development the injection into them of the vital fluids, which, upon first emergence, are largely contained in the cavities of the thorax and abdomen. Hanging pendant on a projecting twig, or clinging to the side of a rock, the insect remains, fanning its wings, while by the strong process of circulation, a rapid injection of the blood into the wings and other organs

takes place, accompanied by their expansion to normal proportions, in which they gradually attain to more or less rigidity. . . . The body is robbed of its liquid contents in a large degree; the abdomen is shortened up; the chitinous rings which compose its external skeleton become set and hardened; the wings are expanded, and then the moment arrives when, on airy p. ions, the creature that has lived a worm-like life for weeks and months, or which has been apparently sleeping the sleep of death in its elements, soars aloft in the air, the companion of the sunlight and the breezes."

It is impossible here to go into any description of butterflies and moths. Butterflies, as a rule, are more brilliant than moths, many of them, in the tropics, especially resplendent in metallic hues, rivaling those of the 'eyes' of peacock-plumes. Moths, on the contrary, are more usually dull of hue, and less given to appearing in open places, even when they fly by day, yet some are high-colored and beautiful.

Both butterflies and moths, and their caterpillars, may resemble to some extent the shape of the object or the coloration of their background, or of other insects. Thus they illustrate most strikingly and copiously various phases of 'mimicry' and 'protective coloring.'

Butterflies, like bees and many other insects, carry pollen from flower to flower, and hence aid greatly in the formation of seeds. See CROSS-FERTILIZATION; INSECTS AND FLOWERS.

GEOGRAPHICAL DISTRIBUTION. Lepidoptera occur wherever plant-life suited to the nourishment of the caterpillars is present. They are sun-loving forms, and are most numerous in species in the tropics. However, in numbers of individuals, some of the temperate zone forms far outrank any of the others. Some species occur in the Arctic zone and on the tops of snow-clad mountains. Certain forms flourish in the far north, in Greenland, Labrador, and Iceland, or on tops of snow-capped mountains. Some species are restricted by temperature or food-plant to a very limited area, while others are practically of world-wide distribution. Widely distributed forms either feed on widely distributed plants, or can feed on a number of different food-plants.

The delicacy of the Lepidoptera has prevented their common preservation as fossils. The Tertiary rocks of the western United States, and the rocks from the time of the British chalk down, have yielded remains of a few scattered species.

About 50,000 species of Lepidoptera are known, of which 6,000 occur in America north of Mexico. Of skippers there are two families—the large skippers, Megathymidæ, and the smaller skippers, Hesperiidæ. The butterflies include the Papilionidæ, Pieridæ, Lycaenidæ, and Nymphalidæ, and all other families (over 40) belong to the moths.

PLATE OF BUTTERFLIES AND MOTES.

1. Butterfly's wings, giving names of parts.
2. Wings, giving names of veins and nervules; I, I, internal veins; C, costal veins; SC, subcostal vein; SC, 1, 2, 3, 4, 5, subcostal nervules; UR, upper radial; LR, lower radial; M, median vein; M, 1, 2, 3, median nervules; SM, submedian veins; PC, precostal nervule; UDC, MDC, LDC, upper, middle and lower discocellulars [after Holland].
3. Resting position of a butterfly.
4. Typical antenna of a butterfly.
5. Resting position of a moth (with typical plumose antennæ).
6. Mouth-parts of a butterfly, showing the extended double proboscis (maxilla, *mx*), mandibles (*m*), labrum (*l*), labial palpi (*lp*), and base of the antennæ (*an*) between the great eyes.
7. Some of the many forms of lepidopteran eggs; *a*, one with a lid lifted at hatching for egress of larva.
- 8, 9. Forms of wing-scales.
10. Arrangement of the scales clothing the wing.
11. A caterpillar, showing parts: *A*, cephalic segments (head); *B*, thoracic segments; *C*, abdominal segments; *a*, rudiments of the six true legs; *b*, four pairs of prolegs.
12. Caterpillar of a moth (*Stauropus fagi*), showing use of prolegs in walking, and extreme development of thoracic larval legs.
13. Caterpillar of a Papilio, showing its retractile osmeteria protruded from the neck.
14. Caterpillar of a puss-moth, showing retractile anal mastigia extended.
15. Caterpillar or measuring-worm of a geometrid moth in an erect and stiffened position simulating a dead twig.
16. Parts of a pupa (chrysalis of a Sphinx-moth): *a*, tongue-case; *b*, eye-case; *c*, trunk-case; *d*, first abdominal segment; *m*, point terminating abdomen; *s*, spiracles, or breathing-pores, opening into tracheæ.
17. Process of change of a butterfly (*Anosia plexippus*) caterpillar into a pupa (after Riley): *a*, caterpillar just before the shedding of the skin; *b*, chrysalis just freed from the molted caterpillar skin, except the cremaster; *c*, pupa holding itself in place, head down, by seizing the folds of the shed skin between the edges of its abdominal segments while it searches with its cremaster for the button of silk, attached to a twig or leaf, in which it will hook the cremaster and hang; *d*, fully developed form of the chrysalis (light green with gold "buttons"). This is an example of a suspended pupa (Suspendul).
18. A belted pupa (Ciceti).
19. History of transformation in the Lepidoptera (a moth): *a*, egg; *b*, young larva; *c*, mature larva (caterpillar); *d*, pupa, within a cocoon; *e*, mature moth (imago).

BUTTERFLY-FISH. A fish of a tropical marine family (Chaetodontidæ), so called because of its gay colors and fluttering activity about the coral reefs, among whose growths it chiefly makes its home, and where it lives by capturing small animals, darting about with an irregular agility suggestive of a butterfly in a garden. It is small, short, very much compressed and deep, and the scales extend over the dorsal and ventral fins so that it is difficult to say where the fins merge into the body. The flesh is excellent food. See CORAL-FISH.

BUTTERFLY-WEED (possibly on account of its gaudy orange-red flowers), or **PLEURISY-ROOT**, *Asclepias tuberosa*. A plant found in

many parts of the United States, and which has obtained a considerable reputation for the medicinal virtues of its root. The root is large, formed of irregular tubers, or spindle-shaped branches, externally yellowish-brown, internally white, with a somewhat acrid, nauseous taste when fresh, merely bitter when dried. It yields its properties to boiling water, and is usually administered in the form of a decoction, fluid extract, or sometimes as a powder. It is diaphoretic and expectorant, and has been found useful in the early stages of pulmonary affections, in rheumatism, and in dysentery. The stem of the plant is erect, 1 to 2 feet high, and hairy; the flowers a brilliant orange-yellow. The sap of the plant is not milky. See ASCLEPIAS.

BUTTERINE. A name for a butter substitute, used interchangeably with oleomargarine. See OLEOMARGARINE.

BUTTER-MAKING. The process of making butter from cow's milk is divided into the operations of creaming, churning, and working or finishing. The fat in milk exists in the form of minute globules in suspension. In the operation of creaming, the separation of these globules from the rest of the milk is effected either by setting the milk in shallow pans or in deep cans in cold water, or by means of a cream-separator. It is possible to make butter by churning the whole milk without first creaming it, and this was undoubtedly the practice in earlier days, but there is far greater loss of fat in this way, and the churning of large quantities of milk is very laborious. In both shallow and deep setting the cream is raised by gravity. The fat-globules, being lighter than the water and other constituents of the milk, gradually rise to the surface on standing, carrying with them some of the other constituents also. The time required and the completeness of the operation depend upon the size of the fat-globules, which differs in the case of different breeds of cows, the larger globules rising more readily. The fat left in the skim milk consists mostly of small globules which failed to rise as soon as the others. The fat content of the skim milk is the measure of the efficiency of creaming. In shallow setting in pans the force of gravity alone is relied upon, the milk being set as quickly as possible after it is drawn, and the cream skimmed off after standing twenty-four hours or longer. The loss of fat by this method is quite large, amounting to about 20 per cent., and the skim milk contains from 0.5 to 1.5 per cent. of fat. In deep setting, cans about 18 inches deep are used, and these are immersed or partially submerged in cold water, preferably at about 40° F. The low temperature causes the globules to rise more rapidly and more completely than in shallow setting. The milk is allowed to stand in these cans for eighteen to twenty-four hours, and the cream is then removed from the top by means of a dipper, or the skim milk is drawn off from below, leaving the layer of cream in the can. The latter method is the least wasteful, and by it the fat in the skim milk may be reduced to as low as 0.2 per cent. under favorable conditions. Efficiency in deep setting depends upon cooling the milk rapidly as soon as it is drawn, and in maintaining a temperature a little above freezing. If the temperature is allowed to rise there is a material loss of fat in the skim milk. The separator has quite generally superseded deep or

shallow setting in creameries and in large dairies during the past few years. In this method the cream is separated from the milk by centrifugal force, in a bowl or drum, revolving at a high rate of speed, from 5000 to 8000 revolutions a minute and even more. The milk enters through a tube reaching to the centre and near the bottom of the bowl, where the high rate of speed causes the heavier milk fluid (the serum) to gravitate toward the circumference of the bowl, while the lighter cream remains near the centre and rises to the upper part of the bowl. The skim milk flows out through a side tube, and the cream through a second tube leading from the centre near the top. The operation is continuous, milk flowing into the bowl and skim milk and cream flowing out of it without interruption. The rate of separation varies with the size and capacity of the machine, the smaller hand separators skimming from 200 to 500 pounds an hour, and the larger forms 2000 pounds and over. By means of various appliances within the bowl the separation of the fat is made quite complete, the skim milk from a good separator properly operated containing only about 0.1 per cent. of fat and in some cases only 0.05 per cent.

The cream obtained by setting or by the separator may be churned at once, as is the case in making sweet-cream butter, or may be first 'ripened' or soured. The object in ripening is to develop the characteristic flavors of butter and a slight acidity which aids in churning and affects the texture of the butter. Ripening is effected by adding to the cream a 'starter' of sour skim milk, buttermilk, or cream from a preceding churning, or a commercial preparation of the desired micro-organisms called a lactic ferment or pure culture. It is necessary to prevent access to the cream of any germs which may cause improper souring, or impart an undesirable taste or quality to the butter, and it is with this view that pure cultures are used for ripening. Pasteurization of the milk or cream used in butter-making, which is practiced quite extensively in some countries, has the same object, the theory being to kill all the germs which may be in the milk or cream, and add only such as are desirable.

The cream is ripened with the aid of the starter mentioned, by keeping it at a constant temperature (60° to 70° F.) until the proper amount of acid has developed, the time required depending upon the number of germs present and upon the temperature. It is then ready for churning. In this process the cream is agitated in a churn (q.v.) to cause the particles of butter fat to unite into masses so that they can be separated from the buttermilk. This is accomplished at a temperature of from 50° to 65° F., the larger fat-globules congealing and uniting first, and the smaller ones adhering to these as they come in contact with them. Finally the whole body of fat may be brought together in a practically solid mass and the buttermilk drained off. After washing, the butter is worked by hand or by machine (see BUTTER-WORKER) to remove the buttermilk and washings more completely, is salted to suit the taste, and then is either packed in tubs or boxes, or made into prints.

Various factors affect the quality of butter aside from the care in making. Among these are the feed of the cows, the conditions under which they are kept, the stage of lactation of the cows,

the handling of the milk and cream to avoid absorbing odors or becoming tainted, etc. The perfection of the separator and other dairy machinery has led to material improvement in the quality of American butter, and has made it possible to make good butter in almost all parts of the United States. Scrupulous cleanliness and close attention to every detail, from the production of the milk to the final packing of the finished product, are prime requisites to success. Since the introduction of the creamery system the amount of butter made on farms has greatly decreased, but there is still much more butter made on farms than in creameries, although creamery butter controls all the markets. See, also, CREAMERIES and DAIRIES. For more detailed accounts of the process of butter-making, the reader is referred to H. E. Wing, *Milk and Its Products* (New York, 1898); "Butter-Making on the Farm," *United States Department of Agriculture, Farmers' Bulletin*, No. 57 (Washington, 1899); and *Handbook of Experiment Station Work*, also issued by the United States Department of Agriculture.

BUTTERMILK. The liquid remaining after the butter fat has been separated from cream by churning. It consists largely of the water, sugar, casein, and ash of the cream, together with a small amount of lactic acid produced in the ripening of the cream (see BUTTER-MAKING), which gives it a slightly acid taste. It also contains a small amount of fat, depending upon the completeness of churning, which failed to separate from the serum. Its composition varies, but is approximately as follows: Water, 91; casein, 3; milk sugar, 4.8; fat, 0.5; and ash, 0.7 per cent. It is a healthful and nutritious beverage, much relished by some persons. In many localities it is used to a considerable extent for feeding pigs, corn-meal or some other grain being usually added to it. For this purpose it has been found to be nearly equal to skim milk, which contains about one-fifth more solid constituents. The pork produced upon it is of excellent quality. See BUTTER-MAKING.

BUTTERNUT (so called on account of its oil), or **WHITE WALNUT** (*Juglans cinerea*). A large, wide-spreading American tree 50 to 75 feet high, ranging from New England to Georgia, and west to Minnesota and Kansas, with nearly smooth bark, and large compound leaves. The leaves and green nuts are clammy and pubescent. The nuts are well known, and form agreeable food when dried; when taken green and pickled they are prized for the table. The nuts contain as much as 4 per cent. of fixed oil, which is sometimes extracted or expressed. Sugar can be made from the sap, but it is much inferior to that made from the maple. The timber is useful for coach and cabinet work, posts, rails, and wooden bowls. The bark of the root is mildly cathartic. A dyestuff was formerly prepared from the bark and husks, and was quite widely used at one time for dyeing woolens, etc., a light reddish brown. For additional illustration, see Plate of BRAZILNUT. See WALNUT.

BUTTER, ROCK. See ROCK BUTTER.

BUTTER-TREE. A name given to several tropical trees, of different orders, the fruit of which yield complex fixed oils, having somewhat the appearance, and used for the purpose, of butter. The butter-trees of India and Africa

BUTTERNUT TREE

BUTTERNUT (*Juglans cinerea*), Northern New Jersey, early May.

belong to the genus *Bassia*, of the order Sapotaceæ; the butter-trees of Guiana and Brazil to the genus *Caryocar* (q.v.), of the order Caryocaraceæ. The oil-palm (q.v.) and the *Cocos butyracea* (see COCOANUT) may also be regarded as butter-trees, although not generally receiving that name.

The mahwa, madhuca, or mahowa of the East Indies (*Bassia latifolia*) attains a height of 50 feet and is found in stony and mountainous parts of India. The succulent corollas of the flowers are eaten raw, and a kind of spirits is distilled from them. They also yield an essential oil. The seeds yield by expression a thick, greenish-yellow oil used as food and also for lamps. The Indian butter-tree, *Bassia butyracea*, occurs in the more mountainous parts of India. The tree grows to a height of 50 to 60 feet. The wood is light and of no great importance. The fruit is eaten to some extent, and from the seeds is expressed the oil or butter, which is white, and is extensively used. The Indian oil-tree, *Bassia longifolia*, is a related species, the seeds of which are used in a similar manner to the others. The wood is said to resemble teak in its strength, hardness, and durability. *Bassia pallida* is said to yield gutta-percha. The butter-tree of Central Africa, described by Mungo Park, is now known as *Butyrospermum Parkii*, although formerly considered a species of *Bassia*. It produces the *Galam butter*, also called *Shea butter* (i.e. tree-butter), which is highly valued and forms an important article of internal commerce in the interior of Africa. The seeds of the fruit, which resembles an olive, are dried in the sun, or in a peculiar kind of oven, and the kernels are then boiled in water, in order to obtain the butter from them, which not only keeps for a whole year without salt, but is also whiter, more solid, and more pleasant to the taste than the butter of cow's milk. This butter is used both as an article of food and of medicine. It has been supposed that the introduction of this tree might be of great importance in other tropical countries.

BUTTER-WORKER. A machine for working butter to remove the buttermilk and washings, to incorporate the salt, and to bring the butter into compact form. (See BUTTER-MAKING.) Both hand and power workers are used; and there are also several forms of the combined churn and butter-worker, in which the butter is worked within the churn without removing it. The latter are always operated by power. Butter-workers reduce the labor of butter-making, and aid in producing a better butter. They make it unnecessary for the hands of the maker to come in contact with the product, and as the grain of the butter is least affected by working it at a temperature of from 45° to 55°, this is an important advantage. They are now very generally employed in creameries and large dairies. See BUTTER-MAKING.

BUTTERWORT (a *wort*, or root, secreting a greasy, butter-like substance) (*Pinguicula*). A genus of plants of the order Lentibulariaceæ. The species are small plants with rosettes of radical leaves that secrete viscid fluid, which catches insects. They are found in bogs and marshes of different parts of the world. The flowers have spurred bilobed corollas, and often have some beauty, especially those

of *Pinguicula grandiflora*, a rare native of the south of France and of Ireland. The common butterwort (*Pinguicula vulgaris*) is abundant in the northern parts of Great Britain and Europe. It has the power of coagulating milk. The Laplanders pour reindeer-milk warm from the animal upon the leaves of this plant, strain it, and set it aside for two or three days, till it acquires the consistence of cream and some degree of acidity, when it is with them a favorite article of food. A little of it in this state will produce the same effect on warm reindeer-milk which was at first produced by the leaves of the plant. The origin of the English name, butterwort, is sometimes referred to the power of coagulating milk, sometimes to the peculiar texture of the leaves.

BUTTERWORTH, HEZEKIAH (1839—). An American editor, juvenile writer, and poet. He was born at Warren, R. I., December 22, 1839. After a common-school education, Butterworth traveled widely in America and Europe, and became (1871) editor of *The Youth's Companion*. Among his popular juvenile books are: *Zigzag Journeys* (1876-90); *A Knight of Liberty*; *The Boyhood of Lincoln*; *The Patriot Schoolmaster*; and *The Wampum Belt* (1896). He has published, also, *Poems for Christmas, Easter, and New Year* (1883); *Poems and Ballads* (1887), dealing with American history; and *Songs of History* (1887).

BUTTMANN, būť'mán, PHILIPP KARL (1764-1829). An eminent German classical scholar. He was born in Frankfort-on-the-Main, and studied in Göttingen under Heyne. He became, in 1789, assistant in the Royal Library in Berlin, and rose successively to be secretary and librarian (1811). He held at the same time (1800-08) a professorship in the Joachimsthal Gymnasium in Berlin, which he afterwards exchanged for a professorship in the newly founded university of that city. He died June 21, 1829. Buttmann is best known by his Greek grammars, the *Griechische Grammatik* (22d ed., 1869), and his *Griechische Schulgrammatik* (14th ed., 1862). His *Lexilogus* (2d ed., 1860) is a study of the difficult words in Homer and Hesiod. His other important works are: *Ausführliche griechische Sprachlehre* (1810-27); editions of selected dialogues of Plato; Demosthenes *In Midiam*; Sophocles's *Philocetes*, *Aratea*, and *Scholia to the Odyssey*. Valuable, also, was his *Mythologus* (1828-29), a collection of essays on myths of the ancients. He continued the great edition of Quintilian begun by Spalding.

BÜTTNER, būť'nēr, KARL GOTTHILF (1848—). A German missionary and linguist, born in Königsberg. He studied theology at the University of Königsberg, in 1872-80 worked under commission of the Rheinische Missionsgesellschaft in Damaraland, and at the same time conducted a school for native teachers at Otyimbingwe. From 1886 to 1889 he was inspector of the Ostafrikanische Missionsgesellschaft in Berlin, and in 1887 was appointed an instructor in the Seminary for Oriental Languages. He published a *Sprachführer für Reisende in Damaraland* (1888); a *Wörterbuch der Suahelisprache* (1891); and *Lieder und Geschichten der Suaheli* (1893).

BUTTON (Fr. *bouton*, bud, button, knob, literally, something pushing out, from *bouter*, to push; cf. Engl. butt). A term applied to the well-known appendages to dress used either for fastening or for ornament; to a sort of oblong latch used by joiners and cabinet-makers for fastening the lids of boxes, doors of closets, etc.; and in technical language, to the mass of fused metal found at the bottom of a crucible or cupel after fusing or assaying.

The use of buttons as an article of dress is a product of modern civilization, as savages employ strings to fasten their clothing together. The Greeks and Romans also employed strings and girdles, the loose, flowing nature of their garments not requiring a more secure fastening. Buttons were first fastened to the clothing for ornamental purposes. The next step was the use of loops and buttons, the evolution of the buttonhole coming last of all. Buttons were first employed in southern Europe in the Thirteenth or Fourteenth Century, and the manufacture of buttons in England dates only from the reign of Elizabeth as a trade of any importance. It has undergone several extraordinary changes, produced chiefly by the ever-varying fashions in dress; but also by some simple, though ingenious, inventions, as well as by foreign competition. In Great Britain, Birmingham has always been the principal seat of the button manufacture. What has been called the 'Augustan Age' of button-making in that city included the latter portion of the Eighteenth and the early part of the Nineteenth centuries, when it was the fashion to wear coats 'loaded with innumerable gilt buttons,' and when employers on a moderate scale in this manufacture were making incomes of from £2000 to £3000 a year, and their workmen from £2 to £4 per week.

There are, in general, three kinds of buttons: Those which are sewed to the garment through holes in the button itself; those which have shanks of metal; those which have, in place of the metal shank, a tuft or layer of felt or other cloth. The last two kinds are usually made on the shell plan, there being two plates of metal with a filling of pasteboard or cloth between, each having the edges turned back, and the one securely pressed into the other by machinery. The face of the button may be covered with cloth or may be of decorated metal. The back has a hole or collet in the centre, through which the metal shank or cloth tuft is introduced. The shell button was invented by B. Sanders, a Dane, who, in 1807, moved from Copenhagen to Birmingham, and there began the manufacture of buttons. He used a metal shank, and his son introduced the cloth tuft in its place. A further modification of the button was made later, when in place of the tuft a thin layer of cloth was secured by a metal plate to the back of the button, which was to be sewed on by means of this loose layer of cloth. At the close of the Nineteenth Century the tendency of fashion was to abandon in a considerable degree the shell button, and to return to the older form with two, three, or four holes. Shanks, when used, are often fastened directly to a solid button, especially if it be of metal.

Among the other materials which have had a great success in their day, it is found that but-

tons made of hoof, under the name of 'horn buttons,' originally introduced more than a half-century ago by E. Bassot of Paris, were for a good many years most extensively manufactured at Birmingham and sent to all parts of the world. The hoofs are first boiled in large kettles and then cut into fragments. These are shaped into buttons, which are then placed under a hydraulic press to stamp various patterns on them. Another machine bores the holes, and still another polishes them. An average factory produces from 1500 to 2000 gross per week.

Vegetable ivory has long been a favorite material for the manufacture of buttons, because it is readily dyed and turned in the lathes. (See *ATTALEA*.) It is the fruit of a South American palm called the corozá-nut, and resembles in appearance true ivory, though some what softer. The nuts cost in France, in 1899 (according to a United States consular report), from \$3.81 to \$5.71 per 100 kilograms (220 pounds). The nuts are first shelled by means of a rotary sheet-iron drum, provided on the interior with sharp, three-edged irons. The nuts are then cut into halves, out of which buttons are bored, or into blocks which are formed into buttons by a shaping machine. The dyeing process requires much skill and chemical knowledge, and each factory has its carefully guarded secrets. The buttons are dried in wire trays, where they are subjected to a certain degree of heat. They are then polished by means of a large, revolving, felt-lined barrel, by polishing stones, and by hand.

Metal buttons are a numerous class, and include buttons for uniforms, trouser buttons, fancy buttons, which are gilt, stamped, chased, or enameled, and many cheap varieties in iron and other metals. Numerous kinds of composite buttons are also partly composed of metal. Glass buttons form another interesting branch, as do also porcelain buttons. Vulcanite buttons have been very extensively made in the United States. As to other materials, a Birmingham manufacturer once said it would be easy to write out a long list from which buttons have been made, but very difficult to name one from which they have *not* been made. In making metal buttons, circular disks, called 'blanks,' are first cut out of sheet brass or other metal by means of fly-presses, usually worked by girls. The fly-press consists of a vertical iron screw with a triple thread, to which screw is attached a horizontal arm, bending downward at the end to form a handle. A punch attached to the press rises and falls with the motion of this handle, and rapidly cuts out the blanks. When large quantities of one pattern are required, a self-feeding, self-acting machine is used, which cuts out the blanks in rows at one blow. After being annealed, the blanks are next made convex by a blow from a stamp. The shanks are formed of wire by a separate machine, which cuts off pieces and bends them into loops of a required form. When these are soldered on, the buttons are dressed on a lathe. They are then gilded and burnished; some, however, are only lacquered; and some, though gilt, are finished in a dead or frosted style. Livery and other buttons having a device in

strong relief are stamped by a die placed in a stamping-press. See DIES.

Buttons with holes, when of pearl-shell, bone, wood, or ivory, are cut with a tubular saw, turned separately in a lathe, and drilled. When of metal the blanks are punched, then stamped in dies to the required form; the holes are punched and finished smooth, so as to round the sharp edges that would otherwise cut the thread. Glass buttons are usually made by taking a rod of glass of any color, softening the end by heat, and pressing it into a mold, each half of which is fixed to one limb of a pair of pincers. The shank is placed in a hole in the mold before the melted glass is inserted.

The manufacture of pearl buttons was introduced into the United States about 1855. The raw material at first came from China, and entered free of duty. In Bohemia and elsewhere such buttons are manufactured in families and by the poorer classes often as a house industry in which all members of the family can engage, the smaller children sewing the buttons on cards. In Austria, France, and Germany the work has largely been done by convicts. The shells are brought from the Red and Mediterranean seas, and there is said to be great danger that the beds will be exhausted, as it takes them twenty years to mature.

During the last decade of the Nineteenth Century the manufacture of pearl buttons in the United States received a great impetus, owing to the discovery of fresh-water mollusks in the Mississippi River admirably adapted to this use. Of the 400 species of mussels found in the river, several varieties are suitable for button manufacture, but the best is the *Quadrula ebena*, or 'nigger-head,' which has a very thick shell, a black or dark-brown outside skin, and a glistening white interior. The fishing is conducted throughout the year, even in the coldest weather, under the ice, when shells are in best condition, being less brittle. On account of the shallowness of the river, fishing is extremely easy, and is carried on so unceasingly, even during the spawning season, that unless measures are taken to regulate the matter, the banks will inevitably be exhausted. Another enemy to the life of the mollusks is the sewage pollution of the river. After the shells are purchased from the fishermen, they are soaked in barrels of fresh water from three to six days, to render them less brittle. They are next sawed into blanks with saws formed by steel strips bent into tubular form. A fine spray of water plays on the shell, to keep it cool and lessen the dust, which is very irritating to the respiratory organs. The back of the button is then ground, to remove the skin and even the surface, and the front is polished and the depression made by means of an emery wheel. The holes are then drilled, and the buttons are ready for sorting, carding, and packing. The manufacture of buttons in the Mississippi Valley began at Muscatine, Iowa, in 1890. It is now the principal business along a section of the river over 200 miles in length, extending from Fort Madison, Iowa, to Sabula, Iowa. In 1898, 7000 tons of mussels were used, at a cost of \$72,000; the manufactured output consisted of 2,250,000 gross of buttons, at a market value of \$500,000. The unit of measure in button

manufacture is a line, or one-fortieth of an inch, and it is stated that—in the United States at least—the cost of manufacture varies pretty directly with the diameter or number of lines of the button. The whole subject of the pearl-button industry of the Mississippi Valley was investigated in 1899, by the United States Fish Commission, from whose reports much information concerning the industry can be obtained.

An interesting account of the development of the button industry in the United States will be found in Bulletin No. 172 of the Twelfth Census of the United States. It is here stated that brass buttons were manufactured in Philadelphia as early as 1750, and, soon after, the manufacture of hard-wood buttons was begun by Benjamin Randolph in the same city. The first button-factory in Waterbury, Conn., which city is now the centre of the metal-button industry, was established about 1800. The manufacture of covered buttons by machinery instead of by hand was begun in 1827 by Samuel Williston, of Easthampton, Mass. Horn buttons were made as early as 1812, the hoofs of cattle forming the raw material. Vegetable-ivory buttons have been made in the United States since 1859, and this branch now ranks third in the button industry. Various kinds of composition buttons have been made since the industry was started at Newark, N. J., in 1862, where a button resembling vegetable ivory was produced from certain fossil and vegetable gums, combined with finely comminuted carbonate of lime, feldspar, or mica. Composition buttons are now made of many materials, among them the Irish potato, which, when combined with certain acids, becomes as hard as stone. Other materials are the casein from skim milk, blood, and brown sea-weed. Prior to 1900, 348 patents for button-machines and 1355 for the making of buttons had been issued by the United States Patent Office. A unique branch of the button industry is the manufacture of campaign and society buttons, and of buttons on which photographs are reproduced. These are usually made from celluloid.

The centres of the different branches of the button industry in the United States are as follows: Bone buttons, Pennsylvania; brass buttons, Connecticut, New York; cloth buttons, Massachusetts; composition buttons, Pennsylvania, New York; fresh-water pearl-button blanks, Iowa, Illinois; fresh-water pearl buttons, New York, Iowa, Pennsylvania; horn buttons, Connecticut; ocean-pearl buttons, New York, New Jersey, Pennsylvania; paper buttons, New Hampshire; tin buttons, New Jersey; vegetable-ivory buttons, New York, Massachusetts, New Jersey. In 1850, according to the Census Bulletin named above, 59 button-making establishments in the United States had an output valued at \$964,359, while in 1900 the 238 establishments reported valued their productions at \$7,695,910. The value of imported buttons declined from \$2,176,046 in 1891 to \$600,982 in 1900.

In China a knob, or so-called button, is worn in the hat as a sign of rank, there being nine ranks, each of them signified by the material of which the button is made. The highest rank is indicated by a ruby; second by a coral; third, a sapphire; fourth, lapis lazuli; fifth, crystal; sixth, white stone; seventh, plain gold; eighth and ninth, differently marked gold.

BUTTON, Sir THOMAS (? -1634). An English navigator, the successor of Sir Henry Hudson in the search for a northwest passage. In 1612-13 he was frozen in and wintered on the west coast of Hudson's Bay. The next summer he explored that coast, returning to England in the autumn.

BUTTON QUAIL. A peculiar quail-like bird of the genus *Turnix*, family *Turnicidæ*, order *Hemipodii* (q.v.), found in the tropical and sub-tropical portions of the Old World. It is also called bustard quail, bush-quail, ortygan, and hemipode. About twenty species are known, one of which—the torillo of Spain (*Turnix sylvatica*)—occurs in southern Europe. They are almost the smallest game birds known, and frequent wooded places, in small coveys, feeding on seeds, berries, and insects, and frequently visiting plantations. The females are more brightly colored than the males, and more forward in their manners than is usual among birds; and their extreme pugnacity is taken advantage of in India in trapping them by the help of a decoy, which they try to assail.

BUTTON'S COFFEE-HOUSE. A famous place of assemblage for wits in Addison's time, situated in Russell Street, Covent Garden, London.

BUTTONWOOD. See PLANE.

BUTTRESS (OF. *bouterets*, from *bouter*, *boter*, to thrust). A structure, usually in the form of a pier, erected for the purpose of giving additional stability to a wall. It is not particularly necessary, except in vaulted construction, so little trace of it is found in Egyptian or Greek art. As its purpose is to balance the outward pressure or thrust, it was not required in the concrete Roman structures, where the pressure, as in a casting, was only downward. The use of buttresses begins in Byzantine architecture (see *BYZANTINE ART*), is continued in Romanesque (see *ROMANESQUE ARCHITECTURE*), and receives its complete and logical development in Gothic (see *GOTHIC ARCHITECTURE*), for these styles used a system of balanced thrusts. This balance was at first largely secured without buttresses, which are useful only where the pressure is concentrated at certain given points, which the buttresses are used to strengthen. For instance, in a Romanesque tunnel-vaulted church, the thrust of the high vault of the nave is continuous, and is met, say, by semi-tunnel vaults over the aisles, whose outline is like that of the later Gothic flying buttresses—like a continuous flying buttress. Buttresses are of four main varieties: (1) Internal; (2) external; (3) pier buttresses; (4) flying buttresses. In Saint Sophia, at Constantinople, two enormous pier buttresses brace the central dome on either long side, doing what the semi-domes perform on the other sides; but the main strain is passed down toward the ground by a skillfully arranged series of vaults over galleries, aisles, etc. In other and less bold Byzantine constructions, all the buttressing is internal. As early as the Romanesque period there is a stronger tendency to reveal structural methods on the outside. The use of external buttressing in the form of piers became then very common, but they remained secondary in usefulness to the aisle vaulting, in resisting the

pressure of the nave vaulting, and their capability by increased projection to strengthen the outer walls was not thoroughly utilized. But when, as in Norman Romanesque, ribbed cross-vaulting was adopted, which concentrated the thrusts on the piers and on the points in the walls opposite them at the base of the vaulting compartments (see *VAULT*), then the buttress was enabled to fulfil its real function. The Gothic framework which then developed was composed of three interacting parts, which secured a perfect equilibrium: (1) The cross-ribbing of the vaults; (2) the supporting piers; (3) the retaining buttresses. These Gothic buttresses consisted of two parts—pier and flying arch. The flying buttress was a purely Gothic invention. Suppose a five-aisled Gothic cathedral, with buttresses outside opposite the fall of each vaulting compartment, and occupying substantially all the space between the large stained-glass windows. A heavy buttress pier rises from the ground, projecting from the outer aisle wall to a point about opposite the base of the vaulting of the nave. It is divided into three stories—the first is part of the outer aisle wall, and receives its vault thrust directly: the second is joined to the upper part of the wall of the gallery, over the inner side aisle, by a flying half arch abutting against its pier buttress; the third is joined in the same way by a longer arch to the base of the vault of the main nave. These flying arches receive the thrust and transmit it along the line of greatest resistance to the main pier buttress. The development of this system by Gothic architects is one of the most interesting details of the style. The earliest examples—in about 1140, at Saint Germer—are low and ineffective; they increase in height and heaviness as the Twelfth Century advances (Esserent, Noyon); and toward 1200 architects know just what form, position, and size are the most effective. They are then able to reduce them in bulk, the more skillfully they use them, and they begin to use for decorative purpose what would seem likely to be an awkward blemish on the exterior of their buildings. A comparison of the buttresses of the cathedrals of Soissons, Notre Dame, Amiens, and Rheims will show how this was managed during the course of the Thirteenth Century in France. Colonnets against the piers, pinnacles and finials as a crown, tabernacles, engaged shafts and blind arcades, gargoyles and grouped moldings, contributed, together with increased elegance of form and harmony of proportions, to make the developed Gothic buttress a beautiful detail, as well as the most vital part of Gothic structure, by which heavy walls were rendered unnecessary. On French façades, the four great piers that divide them into three sections are buttresses, though other Gothic schools beside the French used the buttress; but as they did not develop it nor thoroughly grasp its function in all its delicacy, they used it less successfully and generally. The Spanish school follows the French most closely, but often omits the secondary pier buttress (cathedral at Burgos). Next in purity comes the English, where sometimes, as at Westminster, an approach is made to French perfection. Then comes Germany, at a great distance; while in Italy, with its defective grasp of constructive principles, the

Gothic buttress is used in two or three cases only (e.g. Frari, Venice). Since the Gothic period the buttress has been practically eliminated. The Renaissance returned to the Roman method of concealed balance of thrusts, and the same method was followed by subsequent styles.

BUTURLINOVKA, бѹрлѹнѹкѹ (originally the estate of Count Buturlin), or ПЕТРОВСКОЕ. A village in the Government of Voronezh, Russia, 35 miles southeast of Bobrov. It has a number of tanneries, flour-mills, and brickyards. Population, 1897, 23,400.

BUTYRIC ACID (Lat. *butyrum*, butter; see BUTTER), $C_4H_8O_2$. One of the so-called fatty acids. It is an important constituent of butter, in which it exists in the form of a glyceride—i.e. an ester of glycerin. The free acid has a disagreeable odor similar to that of stale sweat, in which it is found in small quantities. It is a thick liquid, somewhat lighter than water, and boiling at $163^\circ C$. It mixes with water in all proportions. It is usually prepared by a double process of fermentation. First, milk-sugar is exposed to the action of the *lactic ferment* present in the air, which transforms the sugar into lactic acid. The lactic-acid solution thus obtained is then subjected to the action of another ferment, the *butyric ferment*, present in decaying cheese; and by this second process of fermentation the lactic acid is gradually transformed into butyric acid, provided the solution is kept neutral by the addition of chalk. The butyrate of lime thus obtained is decomposed with dilute hydrochloric acid, and the free butyric acid is separated by distillation. Butyric acid may also be prepared from butter by boiling (saponifying) with caustic potash. The acid called *isobutyric acid* has the same molecular composition as butyric acid, though the two differ distinctly in their physical and chemical properties; thus isobutyric acid boils at $155^\circ C$, and, unlike butyric acid, has a limited solubility in water. The constitutional formula assigned to butyric acid is $(CH_3CH_2CH_2COOH)$; that assigned to isobutyric acid is $(CH_3)_2CH.COOH$.

BUTYRIC ESTER, or PINEAPPLE OIL. An exceedingly fragrant oil obtained by distilling a mixture of butyric acid, alcohol, and sulphuric acid. The butyric ester which passes over is generally mixed with alcohol, and sold in commerce as *artificial pineapple oil*. Its odor resembles that of pineapples. The substance is used in the manufacture of fruit candy and in perfumery. In its formation, ordinary alcohol (C_2H_5OH) combines with butyric acid (C_4H_7COOH), according to the following chemical equation:

See also ESTERS.

BUXTEHUDE, бѹхтѹхѹдѹ, DIETRICH (1637-1707). A noted German organist and composer, born at Elsinore, Zealand, Denmark. Nothing is known regarding his musical training. He must have achieved a considerable reputation by 1668, for in that year he was appointed organist of the Marienkirche of Lübeck, at that time one of the most important posts of the sort in Germany. There he exercised a powerful influence upon the musical history of

his time. Not only was he distinguished as an organist, but he established the 'Abendmusiken', famous throughout Germany even into the Nineteenth Century. These were services, comprising organ music and concerted works for chorus and orchestra, given annually in the Marienkirche, on the afternoons of the five Sundays preceding Christmas. It is recorded that to hear these performances in 1705 Bach walked 50 miles, from Arnstadt to Lübeck, where he prolonged his month of leave to three months. Buxtehude was surpassed in the choral by the Pachelbel (q.v.) school, but he was eminent as a pioneer in purely instrumental music, later carried to its full development by Bach. Many of his compositions have been lost. Fourteen *Choral-Bearbeitungen* have been edited by Dehn (Leipzig), and the organ works that are still extant by Spitta (2 vols., Leipzig, 1876-78). Various separate pieces have appeared in Busby's *History of Music* (London, 1819); Commer's *Musical Caca* (26 vols., Berlin, 1839 et seq., Vol. I.); Ritter's *Kunst des Orgelspiels* (Leipzig, 1877); and other works.

BUXTON (AS. *boc*, Ger. *Buche*, Scotch, *buck*, Engl. *beech* + AS. *tun*, Engl. *town*). A market-town and watering-place in Derbyshire, England, 33 miles northwest of Derby (Map: England, E 3). It lies 900 feet above the sea, in a deep valley, surrounded by hills and moors, which have been tastefully planted, the only approach being by a narrow ravine. Buxton is famous for its calcareous springs, tepid ($82^\circ F$.) and cold (discharging 120 gallons of water per minute), and its chalybeate springs. It is visited annually from June to October, by 12,000 to 14,000 persons, the waters being taken for indigestion, gout, rheumatism, and nervous and cutaneous diseases. There is a small industry in ornaments made from alabaster and spar. Buxton is in direct railway communication with London, 160 miles distant. Near Buxton are Diamond Hill, famous for its crystals, and Poole's hole, a stalactitic cavern about 560 yards long. About five miles east of Buxton is Chee Tor, a perpendicular limestone rock 300 feet high. Population, in 1891, 7540; in 1901, 10,181. The Romans had baths here. Mary Queen of Scots resided for some time at Buxton when in the custody of the Earl of Shrewsbury.

BUXTON, JEDEDIAH. See CALCULATORS, REMARKABLE.

BUXTON, Sir THOMAS FOWELL (1786-1845). An English philanthropist. He was born at Earl's Colne, Essex, the eldest son of a wealthy family. At his graduation from Trinity College, Dublin, at 21 years of age, he was asked to represent the University in Parliament, but declined. He married a sister of the celebrated Mrs. Elizabeth Fry in 1807, entered business as a brewer, and by his energy and great business ability ultimately accumulated a large fortune. He at once interested himself, also, in local charities, and in educational and religious enterprises. In 1818 he entered Parliament as member for Weymouth, which he continued to represent for about twenty years, taking a prominent part in all debates on such questions as the amelioration of criminal law and of prison discipline, the suppression of the suttee in India, and the emancipation of slaves. The latter, in particular, engrossed a large share of his activity

for many years, and no one displayed more indomitable zeal and firmness in its advocacy. In 1837 he was rejected by his constituency, and refused ever after to stand for a borough. In 1840 he became a baronet. For his life, consult *Memoirs of Sir T. F. Buxton, Bart.*, edited by his son, Charles Buxton (London, 1872).

BUXTORF, buks'törf, JOHANN, THE ELDER (1564-1629). A German Orientalist. He was born at Kamen, Westphalia, December 25, 1564. His student years were spent at Marburg, Herborn, Heidelberg, Basel, Zurich, and Geneva, and after traveling through Germany and Switzerland he settled at Basel, where he became professor of Hebrew in 1591, at the instance of his teacher, Grynaeus, and there died of the plague, September 13, 1629.

It was while studying at Herborn under Piscator that he imbibed his love for Hebrew, to the study of which and of Rabbinical literature he devoted his life. He associated much with learned Jews, and so great was his acquaintance with Jewish writings that he was frequently consulted by Jews on matters relating to ceremonial laws. His learning gained for him the title 'Master of the Rabbins.' His most important works are *Synagoga Judaica hoc est Schola Judæorum* (1604); his *Biblia Hebraica Rabbinica* (1618-19); his *Tiberias; sive Commentarius Massorethicus* (1620); his *Lexicon Chaldaicum Talmudicum et Rabbinicum* (1639), a most comprehensive work of which a new edition was issued by Fischer (1866-74); and his *Concordantiæ Bibliorum Hebraicorum* (1632; new ed. by Bär, 1862-63). The two last-named works were, however, not completed by Buxtorf, and were published after his death in completed form by his son, Johann Buxtorf. Consult Kautsch, *Johann Buxtorf der Aeltere* (Tübingen, 1880).

BUXTORF, JOHANN, THE YOUNGER (1590-1664). Son of the preceding, also an Orientalist. He was born at Basel, August 13, 1590. At the age of 12 he entered the University at Basel, and at 16 he received the diploma as Master of Arts from the hands of his father. After finishing his studies he proceeded to Heidelberg and subsequently to Geneva. In 1623 he was offered the chair of logic at Lausanne, but declined, preferring to return to Basel, where, after holding various clerical offices, he was elected, in 1629, to succeed his father at the university. He remained in Basel, holding during his residence various chairs until his death on August 16, 1664. He was married four times; his first three wives dying shortly after marriage. Of his children, all died young except two boys, one of whom, Johann Jacob, succeeded his father in the chair of Hebrew. Much of his life was spent in controversies regarding disputed biblical and theological questions, notably regarding the antiquity of the vowel system in Hebrew. Besides his *Lexicon Chaldaicum et Syriacum*, which appeared (Basel, 1622) with a preface by his father, he completed and published from the MSS. of his father the *Lexicon Chaldaicum, Talmudicum, et Rabbinicum* (Basel, 1639) and *Concordantiæ Bibliorum Hebraicorum* (Basel, 1632).

BUXUS: See Box.

BUYS-BALLOT, buys'bál'lot', CHRISTOPHORUS HENRICUS DIDERICUS (1817-90). A Dutch meteorologist, born at Kloetinge, and educated at

the University of Utrecht. He became professor of mathematics in the university (1847), and professor of experimental physics (1870). In 1854 he was appointed director of the Royal meteorological institute at Utrecht. He was the first to make a practical application of a system of storm-signals in Europe and invented the *aërochinoscope*, used on the Dutch coast to communicate to vessels at a distance the direction from which wind or storm is to be expected. He is, perhaps, best known for the Buys-Ballot Law, a statement expressing the connection of wind-directions with a given storm-centre. He was active in endeavoring to obtain an international uniformity in meteorologic observations. His publications include *Changements périodiques de la température* (1847); *Eenige regelen voor te wachten van weerverandering in Nederland* (1860: "Some Rules Regarding Weather Changes in Holland"), and 40 volumes of the *Annual* of the Meteorological Institute.

BUZAU, bú'sou, BUZEO, or BUSEO. The capital of a district in western Wallachia, Rumania, on the Buzau River, and on the Rumanian-Bucharest Railway. It is an episcopal see, with a cathedral establishment and other public buildings, and has a considerable domestic trade. Population, in 1899, 21,561.

BUZFUZ, SERGEANT. A caricature of a contemporary class of barrister in Dickens's *Pickwick Papers*. He is counsel for Mrs. Bardell in her breach of promise suit against Pickwick. His firm has taken up her case thinking that the latter will pay the costs; and when they lose their fees by the defendant's choice of jail instead of blackmail, they very nearly land their own client in prison. Buzfuz is inimitable at showing dark intentions in the most innocent actions and speeches of Pickwick.

BUZULUK, bú'zoo-lóok' (founded in 1756 on the Buzuluk River). A district town in the Government of Samara, Russia, 110 miles east-southeast of the city of Samara (Map: Russia, H 4). The chief industries include the casting of church bells and the preparation of sheepskins. Population, in 1897, 14,500.

BUZZARD (OF. *buzart*, Fr. *buse*, from Low Lat. *busio*, Lat. *buteo*, a kind of falcon or hawk). A hawk of the genus *Buteo*, a widely distributed group. They are of medium or rather large size, heavy-bodied, of strong but measured flight. They are not so spirited as the falcons (q.v.) and capture their prey more stealthily. They live very largely on the smaller mammals, such as field-mice and squirrels, but they also often capture birds, and are frequent visitors to the poultry-yard. The wings are rather long and pointed, exceeding the tail; feet robust, with tarsi partially feathered. The type of the genus is the common buzzard of Europe (*Buteo vulgaris*), which measures about four feet across the wings, and is prevaillingly brown, with a considerable mixture of black on the upper parts, and of white or grayish white on the under. In America this species is replaced by Swainson's buzzard (*Buteo Swainsoni*), which is one of the commonest large hawks from the Mississippi westward to the Pacific. It occasionally strays eastward through the Northern States. In color it is only slightly different from the European species, but it is somewhat larger. Some nine or ten other buzzards occur in the United States.

but only two or three of them are widely distributed. The most common of these is the red-tailed hawk (*Buteo borealis*), found over all North America. The tail of the adult bird is a rich rufous, tipped with white and with a narrow black band near the tip. The red-tail is one of our largest hawks, measuring from four and a half to five feet across the wings. Though often called the 'hen-hawk,' he seldom attacks poultry, and feeds largely on frogs and insects, as well as mice and squirrels. The nest is a large affair of sticks built in a tree from 30 to 70 feet from the ground. The eggs, laid very early in the spring, are usually three or four in number, dull white, somewhat marked with brown. Closely allied to the red-tail is the red-shouldered hawk (*Buteo lineatus*), a somewhat smaller bird, and easily recognizable by the rufous wing coverts, forming a bright patch at the bend of the wing. The red-shouldered hawk has about the same range as the red-tail and is often confused with it under the names 'hen-hawk' and 'chicken-hawk,' but poultry is really a very insignificant part of its diet. Its breeding habits are similar to those of the red-tail. The broad-winged hawk (*Buteo latissimus*) is much smaller than either of the preceding, and is confined to the eastern part of the continent. It feeds very largely on insects.

The name is often extended to the genus of which the rough-legged hawk (*Archibuteo lagopus*) is the best-known species. These buzzards are easily recognized by the feathered tarsus, the feathers extending clear to the toes in front. The rough-leg is one of the most wide-ranging hawks known, being found in the Old World from Lapland to the Cape of Good Hope, and in America as far south at least as Virginia. It is somewhat darker than the European and is ranked as a separate subspecies. (See PLATE OF EAGLES AND HAWKS.) In the western part of North America is found a closely allied species, the 'California squirrel-hawk,' which is considered "one of the largest, handsomest, and most distinctively marked hawks of North America." Besides these various buzzards already mentioned, about twenty other species are known, found in all parts of the world. In America, the name buzzard is commonly given to the American vultures, of which the common turkey-buzzard (q.v.) is the most familiar example.

BUZZARD, MR. JUSTICE. An ignorant and corrupt judge in Fielding's *Amelia*.

BUZZARD-EAGLE. See EAGLE.

BUZZARD'S BAY. A bay on the south coast of Massachusetts, about 30 miles long by 5 to 10 miles wide, sheltered from the ocean and partly separated from Vineyard Sound (q.v.) by the Elizabeth Islands (Map: Massachusetts, F 4), which form a portion of the southern boundary. Buzzard's Bay is a favorite summer resort. In the bay are the harbors of New Bedford, Wareham, Sippican, Nasketucket, and Mattapoiset.

BY-BIDDING. A fictitious bidding at an auction sale on behalf of the vendor, at his request or with his connivance, for the purpose of enhancing the price and without the intent of buying. Another name for this practice is 'puffing.' In England, secret by-bidding or puffing by a single bidder will vitiate a sale at an auction advertised as being without reserve. Such appears to be the rule generally prevailing in the

United States. When the auction is not announced to be without reserve, there is considerable authority both in England and in the United States for the view that a single puffer will not invalidate the sale, if he is employed to prevent a sacrifice of the property at too low a price, and does not run the price up unduly. The safe and honorable course for an owner, however, who wishes to save his property from sacrifice at auction, is to give notice that he reserves the right of bidding, or of withdrawing the property, if satisfactory bids are not made. An agreement by the vendor to pay the puffer for his services is unenforceable whenever the services are illegal. See AUCTION; CONTRACT.

BYBLOS, bib'lōs (Gk. *Βίβλος*). An ancient city of Phœnicia, more properly Gyblos, now called Jebeil, situated at the base of the Lebanon, about half way between Tripoli and Beirut. It is frequently mentioned in Phœnician inscriptions under the form G B L and appears in cuneiform documents as early as the Fifteenth Century B.C. as Gubli, in later inscriptions also as Gubal. From the el-Amarna tablets it is evident that it was a place of considerable importance already at a remote period, and was prominently involved in the western campaigns of Tiglath-pileser III. and Shalmaneser IV. (Eighth Century B.C.). How the change from initial G to B was brought about is not known, but among Greek writers (e.g. Strabo), it is invariably known as Byblos. Byblos was the seat of worship of Adonis of Tammus and of Astarte under the name of Baalet-Gublu (lady of Gublu or Byblos). The town is called Gebal in the Bible; Ezek. xxvii. 9 mentions the maritime pursuits of the inhabitants. The remains of the town are rich in ruins, dating from Roman times and the period of the Crusades. It was the birth-place of Philo.

BYELINSKI, byē-lén'ské, VISSARION GRIGORYEVITCH (1810-48). A Russian literary critic. He was born at Sveaborg, the son of a physician. He attended the gymnasium at Penza and studied philology at the University of Moscow, where he became intimate with the 'idealist' circle of Stankyevitch, Herzen, and others. In 1832, on account of a tragedy directed against serfdom, he was expelled from the university, ostensibly on the ground of 'incapacity.' In 1834 he made his debut with the famous *Literary Reveries*—a brilliant survey of the historical development of Russian literature—in *Rumor*, and contributed to it and the *Telescope* until their suppression in 1836. Two years later, with several friends, he undertook to edit the *Moscow Observer*. Under the influence of Bakunin and a one-sided interpretation of Hegel's proposition: 'all that exists is rational,' he preached complete acceptance of and conciliation with reality. At the same time he advocated the theory of pure art, which aimed at an artistic embodiment of 'eternal ideas' and not at a reproduction of life. In 1839 he went to the capital and became principal contributor of the *Annals of the Fatherland*. 'Reality' soon frightened him here, and all the fiery striving for truth and right now turned into deep grief over this reality. From 1840-46 he wrote a series of long essays on Derzhavin, Lermontoff, Gogol, Koltsoff, Pushkin (the last a volume of over 600 pages), and other popular writers, the whole forming practically a history of Russian litera-

ture from Lomonosoff down to his own day. Byelinski's critiques now acquired a social character, and he appeared not only as a keen æsthetic judge, but as a passionate critico-publicist as well, fighting for personal rights, unmasking social and literary hypocrisy, scourging stagnation, routine, and lack of humaneness in society. In 1846 he began to contribute to the *Contemporary*, rejuvenated under the editorship of the poet Nekrasoff. His last great effort was his *Literary Review for the Year 1847*, in which he saw the hope of Russian literature in the 'naturalistic' works of Turgenieff, Gontcharoff, Dostoyefski, and others. His health was undermined, and the trip abroad could not delay the progress of consumption, which brought him to the grave on the eve of his arrest by the police on account of his radical views.

A perfect master of style, passionate, and endowed with a brilliant fancy, with a natural bitterness greatly increased by physical ailing and the hardships of life, he poured all his heart and soul into his work. Greeting with ardent delight the appearance of every new gifted writer, he unerringly foretold his future development, basing his opinion upon a careful analysis of his work. Besides giving correct estimates of all the chief Russian writers and bringing down the history of Russian literature to certain well-defined periods, he was the first Russian to establish right conceptions of art and literature, and to point out the direction which literature must take to become a social force.

His works, in twelve volumes, were published in 1850-62, and later. In 1898, after the copyright ceased, several new editions appeared. The best is now (1902) in the course of publication, with profuse notes by S. Vengeroff (to be in twelve volumes). Consult A. Pypin, *Byelinski: His Life and Correspondence* (Saint Petersburg, 1876).

BYELOSTOK, byá'lo-stók'. See BIALYSTOK.

BYERLY, WILLIAM ELWOOD (1849—). An American mathematician. He was born in Philadelphia, Pa., and in 1871 graduated at Harvard. He was assistant professor at Cornell (1873-76), and since then has been at Harvard, first as assistant professor, and then, after 1881, as full professor of mathematics. He became a Fellow of the American Academy of Sciences in 1878, and has published *Elements of Differential Calculus* (1879); *Elements of Integral Calculus* (1881); a *Treatise on Fourier's Series and Spherical, Cylindrical, and Ellipsoidal Harmonics*; and *Problems in Differential Calculus* (1895).

BYERLY TURK, THE. The sire of the Herod race-horse stock, ridden in the Irish Rebellion of 1689, by one Captain Byerly and named after him. He was one of the triad from which all English thoroughbreds mentioned in the stud-book are traced. See GODOLPHIN BARD.

BYFORD, WILLIAM HEATH (1817-90). An American physician. He was born in Eaton, Ohio, graduated at the Ohio Medical College in 1844, and became professor of anatomy in the Evansville (Ind.) Medical College in 1850. In 1857 he was appointed professor of obstetrics and diseases of women and children in the Rush Medical College (Chicago), where he became professor of gynecology in 1880. He was president and professor of clinical surgery in the Women's Hospital Medical College from its organization in 1862 until 1880; was twice president of the

American Medical Association; and was president of the American Gynecological Society. Among his works, the best-known are: *Surgery Applied to Diseases of Women* (1865, 2d ed. 1871), and *Philosophy of Domestic Life* (1868).

BYINGTON, EZRA HOYT, D.D. (1828-1901). An American Congregational scholar. He was born at Hinesburgh, Vt., September 3, 1828, graduated at the University of Vermont, 1852, and at Andover Theological Seminary, 1857; was pastor in various places. He wrote *The Puritan in England and New England* (Boston, 1896, 4th ed., 1900); *The Puritan as Colonist and Reformer* (1899); also the histories of the Congregational churches at Hinesburgh, Windsor, and New Haven, Vt.; a memorial of Rev. E. Cutler, D.D., and a volume of sermons, *The Christ of Yesterday, To-Day, and Forever* (1897). He died at Newton, Mass., May 16, 1901.

BY-LAW (probably on the analogy of *by-path*, *by-way*, corrupted from *byrlaw*; see *BY-LAW*). As the term itself indicates, it was first applied to the local rules or laws of a township, manor, or vill, but, as used at present, the term includes all rules or regulations made by public or private corporations, or even by unincorporated societies, for their own management or for the government of their members. The power to make and to change its by-laws belongs to every corporation, even without an express grant of authority. When the power is conferred by charter, or by a general statute, upon particular persons, such as a board of directors, it can be validly exercised only by such persons. In the absence of any limitation, however, the power belongs to the members at large. A by-law which is repugnant to a constitutional provision or to a settled rule of law, or which is unreasonable, is invalid. A valid by-law of a municipal corporation (or ordinance, as it is usually called in this country) is a true law, for it has the authority of the State behind it. A breach of it subjects the offender, generally, not only to an action for a penalty, but to a criminal prosecution. By-laws of private corporations or of unincorporated societies are rather agreements binding on the members, than laws, in the true sense of that term. Consult the authorities referred to under *CORPORATION*; *ULTRA VIRES*; and also Boisot, *By-Laws of Private Corporations* (2d ed., Saint Paul, 1902); Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899).

BYLES, bilz, MATHER (1706-88). A New England clergyman and poet, distinguished for wit and repartee. He was born in Boston, March 26, 1706, graduated at Harvard in 1725, and after being ordained to the ministry, received charge, December 20, 1733, of the Hollis Street Congregational Church, Boston. He was distinguished as a pulpit orator, and his published sermons show a considerable command of language. He corresponded with Pope and Swift, and wrote a *Poem on the Death of George I.* (1727); a *Poetical Epistle to Governor Belcher on the Death of His Lady* (1736); and *Miscellaneous Poems* (1744), which were lauded by his contemporaries to an extent that now seems ludicrous. Byles was a consistent Tory, and in 1776 left his parish on that account. In 1777 he was denounced as an enemy of his country, tried, and condemned to imprisonment and banishment, but

he was suffered to remain in his own house, "guarded, regarded, and disregarded," as he said, and lived in Boston till his death (July 5, 1788), bequeathing his Royalist sympathies to his daughters. His son, Mather (1736-1814), also a clergyman, became an Episcopalian in 1768, and on the founding of Saint Johns, New Brunswick, by the Tories, who had been expelled from Boston, became their rector till his death (1814).

BYLINA, bi-lé'na (Russ., the past, from *byti*, Skt. *bhū*, to be, as it is historical in character). The epic songs of Russia, covering a period from mythological to comparatively modern times. Their heroes, *bogatyr*s (paladins), are either mythical, types of the forces of nature, or historical personages. The former, the so-called 'elder paladins,' occupy a small part of the epic songs, the bulk of them dealing with the latter, or 'younger paladins.' In the cycle of 'younger paladins,' aside from the minor portion dealing with the later Moscow period, two main earlier sub-divisions are distinguished: one clustering around the Southern capital, Kiev, and its Prince Vladimir, the other around the free city of Novgorod. The central figure in the Kiev period is Ilya Muromets (q.v.). The *bylinas* have been collected from bards in the northern part of Russia and in Siberia, particularly in the governments of Olonets, Arkhangelsk, and Toms. Consult: Rambaud, *La Russie épique* (Paris, 1876); Wesselofsky, "Beiträge zur Erklärung des russischen Heldenepos," *Archiv für slavische Philologie*, Vol. III. (Berlin, 1879); *Epic Songs of Russia*, translated by Isabel Hapgood (New York, 1886).

BYLLYNGE, bil'ling, EDWARD (? -1687). An English Colonial proprietor. With John Fenwicke, he purchased in New Jersey an extensive tract of land, including that part of the province north of an imaginary line drawn from Burlington to Barnegat. A quarrel regarding the division of the land having somehow arisen between these Quaker associates, William Penn, as arbiter, adjudged nine-tenths of the total property to be Byllynge's. Byllynge, however, soon made an assignment in favor of his creditors, and his holding, long styled the 'Byllynge tenths,' was disposed of to two organizations of the Society of Friends. In 1677 he was elected Governor of West Jersey Province.

BYNG, bing, GEORGE, Viscount Torrington (1663-1733). A British admiral, born at Wrotham, Kent, January 27, 1663. He entered the navy at the age of 15, and was rapidly promoted. In 1688 he gained the favor of the Prince of Orange by activity and zeal in his cause, and received the rank of captain. In 1703 he was made Rear-admiral of the Red. The attack on Gibraltar was confined to his command, and for gallant conduct at Malaga he was knighted by Queen Anne. In 1706 he was elected to Parliament, and represented Plymouth until 1721. In 1708 he became Admiral of the Blue, and commanded a squadron fitted out to oppose the Pretender's intended invasion of Scotland from France. He pursued the French fleet to the Firth of Forth, took one ship, and forced the fleet back to Dunkirk, on which occasion he was presented with the freedom of Edinburgh. On the breaking out of the Rebellion of 1715, he was appointed commander of a squadron in the Downs, and for important services against

the French, was created a baronet. In 1718 he commanded the English fleet sent to Sicily for the protection of the neutrality of Italy, and gained a striking victory over the Spanish fleet off Messina. Soon after he was appointed treasurer of the navy and rear-admiral of Great Britain. In January, 1721, he became a privy councillor, and in September following was created Baron Southill and Viscount Torrington. On the revival of the Order of the Bath, in 1725, he was installed one of the knights, and on the accession of George II. was nominated first Lord of the Admiralty. He held this office till his death, January 17, 1733.

BYNG, JOHN (1704-57). A brave but ill-fated British admiral, fourth son of Admiral George Byng, Viscount Torrington. He entered the navy early, served under his father in 1727, became captain, and by 1748 attained the rank of Admiral of the Red. In 1756 he was promoted Admiral of the Blue, and appointed to command a hastily equipped squadron of ten ships, sent to the relief of Minorca, at that time blockaded by a French fleet under La Galissonnière. On the 20th of May Byng gave the signal to engage, which was obeyed by Rear-Admiral West, but Byng, through ill manœuvring, failed to support him, and the French, acting on the defensive, remained victors. Byng did not consider himself justified in making other efforts, and left Minorca to its fate. The dissatisfaction in England, when the news arrived, was taken advantage of by the Ministry to divert public odium from their inefficient measures. Byng was tried by court-martial and condemned to death, for a breach of the Twelfth Article of War, but recommended to mercy. Sacrificed to the general indignation, he was shot on board the *Monarch*, at Portsmouth March 14, 1757, meeting his fate with firmness and resignation.

BYNKERSHOEK, bin'kērs-hōök, CORNELIUS VAN (1673-1743). A Dutch jurist, born at Middelburg, in Zealand, May 29, 1673. He studied at the University of Franeker, took the degree of doctor in 1694, and immediately after commenced to practice as an advocate at The Hague. In 1703 he was elected by the States-General a member of the supreme council of Holland, Zealand, and West Friesland, and, in the exercise of his functions, soon had occasion to observe how defective was the common law of the country. With a view to remedy this, he published various works on the civil law, the most important of which was the *Observationes Juris Romani*. In 1724 he was elevated to the dignity of president of the supreme council. His works on international law acquired wide celebrity. The most famous are *De Dominio Maris* (1703) and *Questiones Juris Publici* (1737). In addition to these, he made a digest, under the title of *Corpus Juris Hollandici et Zelandici*, of all the laws of his own country. He died April 16, 1743. A complete edition of his works was published at Geneva in 1761.

BYNNER, EDWIN LASSITER (1842-93). An American novelist and librarian of the Boston Law Library. His best stories are three historical tales: *Agnes Surriage* (1886), *The Begum's Daughter*, and *Zachary Phips*. Of minor significance are *Tritons* (1878) and *Penelope's Suitors* (1887). *The Chase of the Meteor* is a juvenile. Numerous other works are negligible.

BYR, byr, ROBERT. See BAYER, KARL ROBERT EMMERICH.

BYRD, bērd, WILLIAM (1674-1744). An American author, son of Col. William Byrd, a Colonial official. He was born at Westover, Va., educated in England for the law, and, on his return to his Colonial estates, became a man of great influence in the Colony. He was a member of the King's Council for 37 years, and finally its president. He lived in lordly state at his plantation, Westover, and gathered the most valuable library in the Colony, numbering about 4000 volumes. He was the founder of Richmond (1733); also one of the commissioners on the North Carolina boundary, and did much to encourage immigration. He was a patron of art and science, and a Fellow of the Royal Society of Great Britain. Byrd is best remembered as the author of the *Westover Manuscripts*, published in 1841 under three titles: *The History of the Dividing Line; A Journey to the Land of Eden; and A Progress to the Mines*, all remarkable for their style, wit, keen observation, and intrinsic interest. The best edition of these is that of J. S. Bassett (1901). Byrd's interesting letters have been published in *The Virginia Magazine of History and Biography* (1902).

BYRGIUS, bār'jī-ūs, JUSTUS, or JOBST BÜRGI (1552-1632). A Swiss mathematician and inventor of various astronomical instruments. He was born at Lichtensteig, Canton of Saint Gall, and was employed as a mechanician first in the service of Wilhelm IV., Landgrave of Hesse, then of Emperor Rudolph II. Among his inventions may be noticed the proportional compasses. He also found a method of resolving spherical triangles, and is said to have hit upon the idea of logarithms.

BYRLAW, bār'la (Icel. byr, AS. by, Engl. by, settlement + *log*, Engl. laic). In early English and Scottish history, the local custom or law of a township, village, or rural district. This law appears to have been administered by popular local tribunals, having no connection with the regular courts of the kingdom, and to have been concerned, for the most part, with disputes as to boundaries, trespass of cattle, etc. It prevailed extensively in England, especially in Kent, as late as the Thirteenth Century, but has now almost everywhere yielded to the common law and the regular tribunals.

BYRNE, bērn, THOMAS SEBASTIAN (1842-). An American Roman Catholic divine, born at Hamilton, Ohio. He received his education at the public schools, the Preparatory Seminary of Saint Thomas, Bardstown, Ky., and Saint Mary's College of the West, where he graduated in 1864. After a supplementary course at the American College, Rome, he was ordained priest in Cincinnati (1869), and became instructor at Mount Saint Mary's Seminary. He was subsequently placed in charge of the Cincinnati Cathedral, and upon the reopening of Saint Mary's Seminary he became rector of that institution. In 1894 he was appointed Bishop of Nashville. In collaboration with the Rev. Dr. Pabisch, he translated Dr. Alzoy's *Church History* (3 vols., 1874-78). His other publications include *Man from a Catholic Point of View*, which was read at the Parliament of Religions (Chicago, 1893).

BYRNIE, bār'ni (AS. byrne, corselet. OHG. brunna, OIcel. brynja, breastplate; cf. OIr.

bruinne, breast). A shirt of mail. In the time of the Carolingians it reached only to the hip, but in the Tenth Century it extended to the knees. The sleeves were made wide and short, affording no protection to the forearm. See COAT OF MAIL.

BYRON, ANNE ISABELLA MILBANKE (1792-1860). The wife of Lord Byron, and the only child of Sir Ralph Milbanke. She was born May 17, 1792; married Lord Byron January 2, 1815, and separated from him in February of the next year. On the death of Lord (properly Baron Scarsdale, she became Baroness of Wentworth and for several years before her death employed her large income in works of charity. She died May 16, 1860. One child was borne by her to Byron, "Ada, sole daughter of my house and heart," who married William, Lord King, afterwards Earl of Lovelace. Consult Stowe, *Lady Byron Vindicated* (Boston, 1869).

BYRON, GEORGE GORDON, sixth Lord (1788-1824). One of the greatest of English poets. He was born in London, January 22, 1788, and was the only son of Capt. John Byron, of the Guards, and Catherine Gordon of Gight, a Scottish heiress. Captain Byron and his wife did not live happily. The husband was a profligate, and the wife's fortune was soon squandered at the gaming-table. Separated from her husband, Lady Byron retired on an income of £150 a year, to Aberdeen, with her lame boy, whom in her capriciousness she treated with alternate violence and affection. In his eleventh year Byron succeeded his grand-uncle, William, Lord Byron, and mother and son immediately left the north for Newstead Abbey, the ancient seat of the family, a few miles distant from Nottingham, in the romantic district of Sherwood Forest. On succeeding to the title, Byron was placed in a private school at Dulwich, and thereafter sent to Harrow (1801). The most remarkable thing about his early years was his extraordinary attachments. In his eighth year, in Aberdeenshire, he fell in love with Mary Duff. His cousin, Margaret Parker, who died early, was his next idol. His strongest passion, however, was for Mary Chaworth, whom he first met when on a visit to Newstead in 1803. Miss Chaworth's father had been killed in a duel by Lord Byron, the grand-uncle of the poet, and marriage would have healed the family feud and joined rich estates. But it was not to be. Miss Chaworth was Byron's senior by two years, and evidently felt little flattered by the worship of the lame Harrow boy. Next year came the parting interview described in *The Dream*. In 1805 Byron entered Trinity College, Cambridge. The next year he had a Newark bookseller print for him a volume of his verse, the entire impression of which he was induced to destroy. With additions and omissions, the volume was republished in 1807. Later in the same year Byron made his first real appearance before the public in *Hours of Idleness*. The poems contained in this volume were not absolutely without merit; but they might have been written by any well-educated boy who, in addition to ordinary cleverness, possessed the slightest touch of poetic sensibility. The volume was fiercely assailed by Brougham in the *Edinburgh Review*, and his sarcasms stung Byron into becoming a poet. Byron attributed the attack to Jeffrey. The satire *English Bards and Scotch Reviewers* was written in reply to the

article in the *Edinburgh*, and the town was taken by a play of wit and a mastery of versification unequalled since the days of Pope. Byron now withdrew from England, visiting Portugal, Spain, Turkey, and Greece. On his return he published the first two cantos of *Childe Harold* (1812), with immense success, and was at once enrolled among the great poets of his country. During the next two years he produced *The Giaour*, *The Bride of Abydos*, *The Corsair*, and *Lara*. While these brilliant pieces were flowing from his pen, he was indulging in all the revelries and excesses of London society. What was obnoxious in the man revolted at this mode of life, and in an effort to escape from it, he married, in 1815, Miss Milbanke, daughter of Sir Ralph Milbanke. This union was unfortunate. It lasted only a year, and during the brief period money embarrassments, recriminations, and all the miseries incidental to an ill-assorted marriage were of frequent occurrence. After the birth of his child Ada Lady Byron retired to her father's house and refused to return. Byron became the theme of all uncharitable tongues. The most popular poet, he was for a space the most unpopular individual in the country. In one of his letters, written from Italy some years later, referring to the slanders current at the time, he said: "I was accused of every monstrous vice of public rumor and private rancor. My name, which has been a knightly or a noble one since my fathers helped to conquer the kingdom for William the Norman, was tainted. I felt that what was whispered, and muttered, and murmured was true, I was unfit for England; if else, England was unfit for me. I withdrew." The separation from his wife and the departure from England in 1816, never to return, mark a stage in the development of Byron's genius. A new element of power now entered into his verse.

Misery and indignation stimulated him to remarkable activity. Six months' stay at Geneva produced the third canto of *Childe Harold*, and *The Prisoner of Chillon*. *Manfred* and *The Taming of Tasso* were written in 1817. The next year he was at Venice, and finished *Childe Harold* here; and, in the gay and witty *Beppo*, made an experiment in the new field which he was afterwards to work so successfully. During the next three years he produced the first five cantos of *Don Juan*, and a number of dramas of various merit, *Cain* and *Werner* representing opposite poles. In 1821 he removed to Pisa, and worked here at *Don Juan*, which, with the exception of *The Vision of Judgment*, occupied his pen almost up to the close of his life. In 1822 Byron, Shelley, and Leigh Hunt started a journal called *The Liberal*. After the tragic death of Shelley in the summer of this year, Byron and Hunt quarreled, and the journal came to a quick close. Morally, Byron's Italian life was licentious, and his genius was tainted by his indulgences. The least ensurable of all his moral lapses was his *liaison* with the Countess Guiccioli. Near the close of his career he was visited by a new inspiration; he soon so long obscured shone out gloriously in its setting. In the summer of 1823 he sailed for Cephalonia to aid the Greeks in their struggle for independence. From Cephalonia he went to Missolonghi at the beginning of January, 1824. There he found nothing but confusion and contending chiefs; but in three months he succeeded in evoking some kind of order out of the chaos.

His health, however, began to fail. He died from exposure and fever April 19, 1824. His body was conveyed to England, and buried in the family vault in the village church of Hucknall, near Newstead.

Lord Byron is a remarkable instance of the fluctuations of literary fashion. Elevated to the highest pinnacle of fame by his contemporaries, he was unduly decried after his death, when the romance which he had thrown around himself and his writings began to wear away; and it is only during the last twenty or thirty years that the proper place has been found for him in the public estimation. The resources of his intellect were amazing. He gained his first reputation as a depicter of the gloomy and stormful passions. After he wrote *Beppo*, he was surprised to find that he was a humorist; when he reached Greece, he discovered an ability for military organization. When all the school-girls of England fancied their idol with a scowling brow and a curled lip, he was laughing in Italy, and declaring himself to be the most unromantic being in the world. And he was right. Take away all his Oriental wrappings and you discover an honest Englishman, who, above all things, hates cant and humbug. In *Don Juan*, which is his masterpiece, and in his letters, there is a wonderful fund of wit, sarcasm, humor, and knowledge of man. Few men had a clearer eye for fact and reality. His eloquence, pathos, and despair, as in *Manfred* and *Childe Harold*, were only phases of his mind. Toward the close of his life, he was working toward his real strength, and that lay in wit and the direct representation of human life.

Murray, Byron's original publisher, has issued several editions of the complete works. Consult Henley, *Works of Lord Byron* (London, 1897—). The latest edition is that by Coleridge and Prothero (London, 1898-1901). The best estimate of Byron is to be found in Matthew Arnold, *Essays in Criticism*, second series (London, 1888). The main source of information as to his life is Moore, *Letters and Journals of Byron, with Notices of His Life* (London, 1830, new ed. 1874). Consult, also: Macaulay, *Moore's Life of Lord Byron* (London, 1831); Elze, *Lord Byron* (Eng. trans., London, 1872); Jeaffreson, *The Real Lord Byron* (London, 1883); Nichol, "Life," in *English Men of Letters* series (London, 1880); Countess Guiccioli, *Lord Byron jugé par les témoins de sa vie* (Paris, 1868); English translation by Jerminingham as *My Recollections of Lord Byron and Those of Eye-witnesses of His Life* (Philadelphia, 1869); Lady Blessington, *Conversations with Lord Byron* (London, 1834); Trelawny, *Recollections of Shelley and Byron* (Boston, 1858); Hunt, *Lord Byron and His Contemporaries* (London, 1828).

BYRON, HARRIET. The author of most of the imaginary epistles which compose Richardson's *Sir Charles Grandison*. She is a youthful sentimentalist, and an orphan.

BYRON, HENRY JAMES (1834-84). An English playwright and actor, born in Manchester. He studied medicine and then law, but soon became an actor and a playwright, and will be remembered as the author of a number of successful plays, the earliest of which was *Fra Diavolo* (1858). *Our Boys* (1878) had a long run, but *Cyril's Success* is generally regarded as

the best of his plays. Among his other works are: *Babes in the Wood*, *War to the Knife*, *A Hundred Thousand Pounds*, and *An American Lady*, all of which display ingenuity rather than invention. He published one novel, *Paid in Full* (1866); was the first editor of *Fun*; and established a short-lived paper called *Comio Times*.

BYRON, JOHN (1723-86). An English admiral and circumnavigator, the grandfather of Byron, the poet. He accompanied Anson around the world, suffering shipwreck and enduring great hardships in Patagonia, and as commander of a fleet he circumnavigated the globe in 1764-66. In 1769 he was Governor of Newfoundland, and in 1776 became vice-admiral. In 1778 he was sent with a fleet to watch the movements of Count d'Estaing, who had gone to the assistance of the United States in their war against England; and in July of the next year he fought the Count of Grenada, but the action was of little importance. In 1708 he published an account of his shipwreck on the coast of Patagonia. It furnished some hints to the author of *Don Juan*, who refers to "my grand-dad's narrative."

BYRON BAY. An open bay, about 50 miles wide, on the east coast of Labrador, North America, in latitude 56° N. and longitude 58° W. (Map: Canada, T 6).

BYRON ISLAND. See GILBERT ISLANDS.

BYSTRÖM, by'ström, JOHAN NIKLAS (1783-1848). A Swedish sculptor. He was born December 18, 1783, at Filipstad, in the Province of Wermeland, Sweden, and educated under Sergell of Stockholm. In 1809 he obtained the highest prize in the Swedish Academy of Arts, and in the following year went to Rome, where he executed his first independent work, a "Drunken Bacchante," and sent it home. It was received with great approbation, and Byström had to repeat it thrice. In 1815 he returned to Stockholm, and surprised the newly elected Crown Prince (Bernadotte) by exhibiting a colossal statue of himself, which he had finished all but the head in Rome, and had found means to complete quietly in Stockholm. The Crown Prince was highly gratified, and commissioned Byström to execute colossal statues of Charles X., XI., and XII. After 1838 he resided in Stockholm; but returned to Rome in 1844, and died there March 13, 1848. His chief works are: "A Nymph Going into the Bath," a "Reclining Juno Suckling the Young Hercules," "Hygieia," "Pandora Combing Her Hair," "A Dancing Girl," a statue of Linnæus, and colossal statues of Charles XIII., Gustavus Adolphus, and Charles XIV. Byström excels in the delineation of females and children, but his male figures are not strongly characterized; his conceptions are always true to nature, his grouping skillful and pleasant, and his execution is clear and distinct.

BYWATER, INGRAM (1840—). An English classical philologist, born in London, June 27, 1840. He received the degree of A.M. in Queen's College, Oxford, 1863, and was tutor, and, from 1883, university reader in Greek. In 1893 he succeeded Professor Jowett as regius professor of Greek. He is the editor of *Fragments of Heraclitus* (1877); *Priscianus Lydus* (1886); *Nicomachean Ethics* (1890); etc.

BYWAYS OF EUROPE. Descriptions of travel by Bayard Taylor (1869).

BYZANT, blz'ant. See BESANTS.

BYZANTINE ART. Broadly speaking, the art that flourished throughout the Byzantine Empire, from the time when Constantine the Great made Constantinople (Byzantium) its capital, A.D. 330, to the capture of the city by the Turks in 1453. The term may be applied to Christian art of the Oriental and Hellenic peoples, as soon as it began to differ from the style of early Christian art, which both East and West had largely in common at the beginning. Its historic development falls into six periods: (1) *Formative Age*, Fourth to the Fifth Century, in which experiments were tried and various forms of architecture and painting put to the service of religion, but no fixed formulas were found. Egypt, Syria, Asia Minor, North Africa, Greece, all erected monuments that differed very much from the official type of Roman Christian basilica; and it was the Hellenic painters who then depicted, both in manuscripts and on church walls, the first portraits of Christ and the earliest systematic series of Bible illustrations. (2) The *Golden Age* of Justinian, began about 527 A.D., and established the true norms of classic Byzantine art. These were, in architecture, the use of the dome on pendentives, with other forms of vaulting in subordination; the decoration of surfaces, mainly by deeply colored mosaics and rich marble facings, without the light and shade of heavy architectural projections or relief ornaments. The standard set by Saint Sophia was never afterwards equalled. The centre of official art was at Constantinople, and the clergy gradually assumed its control. This school declined during the Seventh Century. (3) The *Iconoclastic Age*, lasting substantially throughout the Eighth Century, while it seemed to give a death-blow to certain forms of religious art, really led to a healthy reform. It temporarily killed religious painting, from an exaggerated fear of the idolatrous tendency of painted images of sacred personages, but developed decorative and floral design, and renovation of social and political life reacted healthily on art, preparing the way for (4) the *Macedonian Revival* of the Ninth and Tenth centuries. The sturdy rulers of the Macedonian dynasty counteracted the morbid and unhealthy tendencies of Byzantine art and fostered the return to classic models. The reigns of Basil the Macedonian, Constantine, and Nicephorus Phocas saw a second Golden Age of superb monuments. The imperial palaces were as magnificent as the palaces of the Cæsars in old Rome, and the industrial arts reached an unequalled perfection. (5) The *Age of the Comneni*, during the Eleventh and Twelfth centuries, at its beginning was as splendid as the preceding. A great new school of art was established at Mount Athos. This monastic school spread its influence far and wide. Many cities and monasteries became special art centres, no longer dependent on Constantinople. Thessalonica continued traditions. The monastic churches of Chios, Daphne, Mount Helicon, Meteora, are a few of the monuments of this age. It was now that Europe, through the Crusades, through the trade with Venice, Pisa, Genoa, and other Italian

cities, and through the Greeks in Sicily and South Italy, came to feel most intensely the influence of Byzantine art, by which the barbarism of European nations was modified and their newly awakened artistic instincts directed. (6) The *Age of the Palæologi*, during the Thirteenth and Fifteenth centuries, is that of decadence. The decline was hastened by the barbarous conquest of Constantinople and the Empire by the Crusaders in 1204. The stream of fruitful art was dried up and the works of this age, which helped to influence Italy in the revival of painting, were unworthy of this high office, and have helped to give the mistaken idea of Byzantine painting generally current. The churches at Trebizond show the decline in architectural grandeur and decorative ability.

Byzantine art was a composite picture, for it had come into a varied inheritance. It derived intense love of color from the Orient, power to idealize from the Greeks, ability in architectural composition from the Romans. Its use as an impressive part of the pomp of imperial power in palace, processions, and ceremonies was thoroughly Oriental. Its exquisite treatment of every detail, where Roman art was so careless, was thoroughly Hellenic; its development of interior effects, its centralization and use for a systematic propaganda of ideas was thoroughly Roman. But in none of this was Byzantine art a plagiarist; it simply utilized these various elements in the service of a perfectly original scheme. Its most important additions to the general fund of the art assets of the world were: the *dome on pendentives*, which made it possible to suspend one or more domes over any kind of a ground-plan, thus securing superb interiors; *figured mosaic wall-paintings*, the most harmonious surface decoration for architecture, the most impressive expression of dogmatic religious art; a *system of Christian iconography*, corresponding to the system of classical mythology and embodying in art the same ideas that were expressed in creeds, dogmas, proceedings of the councils, and writings of the Fathers, and so serving as an important vehicle of religious instruction; the *preservation of classic traditions*, which would otherwise have been broken, and the imparting of them in modified form to the Mohammedans and Europeans of the Middle Ages; the *development of the minor arts* to a higher pitch of perfection than ever before, giving models to all branches of art elsewhere. It is well known how Byzantine ivories, miniatures, and enamels were the inspiration of mediæval sculptors and painters in Europe, their minute figures being enlarged in monumental copies.

When Byzantium was transformed into Constantinople by Constantine, the enlargement of the old city was made by the work of a large number of artists and artisans imported by Constantine from all parts of the Empire, but especially from Rome. A second pillaging of the artistic treasures of the ancient world took place for its benefit. Its forums, basilicas, baths, theatres, circus, were filled with works of Greek sculpture. While even then there was undoubtedly a considerable Hellenic element, the transformation of Christianity from a Roman to a Byzantine cult was gradual during the Fifth Century, and is symbolized by comparing the basilica of Saint John (c.450), still in the Latin style, slightly modi-

fied, with the 'little Saint Sophia,' or Church of Saints Sergius and Bacchus, in which, c.525, the elements of the Byzantine style were largely embodied. Probably these elements had been first worked out in more purely Hellenic soil and then brought into Constantinople; as, for instance, was the case with the scheme of Saint Sophia, brought in by architects from Asia Minor. The various stages in the school of Constantinople before and after the time of Justinian are illustrated by the many magnificent cisterns with their forests of columns (Fourth to the Tenth Century), the scanty remains of some of the old palaces (Boucoleon) and monasteries, the churches of Saint John (Fifth), Saints Sergius and Bacchus (Sixth), Saint Irene (Eighth), Theotokos (Tenth), Monêtes-Khoras (Eleventh to the Thirteenth), Pantokrator (Twelfth). It is this central school which developed mosaic painting, a form of decoration that is seldom found in Asia Minor, Syria, Palestine, Egypt, or other parts of the Empire. It is difficult to follow the geographical intricacies of Byzantine art, for to the division into schools are added the territorial fluctuations. The official and central school at Constantinople was followed more or less strictly throughout the Greek provinces; almost as closely in parts of Asia Minor; still less closely in Syria. Certain large territories which were wrested from the Empire by the Arabs in the Seventh Century were at that time beginning to feel the strength of the influence of Constantinople, though they had not yet lost their artistic independence. Such were the provinces of Northern Africa and Egypt, of Mesopotamia, and part of Syria. The Coptic school in Egypt had some of its roots in ancient Egyptian art, but the churches of Old Cairo and the monasteries of the desert show that especially in decoration Byzantine art had obtained a strong foothold and that the Byzantine reminiscences found in the later Mohammedan art of Egypt are largely attributable to this source. Other regions of the East which remained unconquered by the Mohammedans mingled local traits with prevalent Byzantine characteristics. This was especially the case in Armenia, Georgia, and the neighboring regions of the Caucasus, where the central dome, or pendentive and high drum, and the Greek-cross plan govern nearly all churches from the Seventh to the Fifteenth Century, as at Dighour and Pitzounda, while their surface decoration is peculiar and akin to what we know as Celtic and northern ornament. Of all Eastern churches, those of Asia Minor—such as those of Cassaba, Myra, and Nicæa—are almost alone the exact echoes of the school of Constantinople, except for the productions of Greece itself and the present provinces of European Turkey. One of the most important functions of Byzantine art was its influence outside of its home sphere. It is quite certain that if when the northern tribes wiped out Roman culture in the West, Byzantine influence had not been actively exerted in Italy; if Ravenna and then Venice had not been preserved as Byzantine outposts and Rome resuscitated by Byzantine monks and immigrants; if Greek colonies had not been thrown into southern Italy, if Sicily under the Normans had not subjected herself to Byzantine influence, and if the great maritime republics that held the trade of the world in their hands from the Ninth to the Thirteenth Century—Amalfi, Venice, Pisa, Genoa—

had not brought to the West all portable works of Byzantine art and themselves become impregnated with the artistic atmosphere of the East; and finally, if the Crusades had not opened up before the barbarous West superb vistas of the artistic civilizations of Byzantines and Mohammedans—if all this had not happened as it did, the torch of progress would not have been handed on and the great Gothic and Renaissance eras would not have been what they were.

ARCHITECTURE. Byzantine architecture is the complete monumental expression of Hellenic Christendom. The Greek Church in most higher branches of culture imposed itself upon the Latins, but it began by accepting the Latin scheme of basilical architecture. After experimenting with it for a while (Fourth to the Fifth Century), the Greek genius selected the Roman dome as its fundamental unit, in place of the wooden roof, and by the use of lofty piers and pendentive was able, in the Sixth Century, to suspend the dome and use it with any kind of ground-plan, even multiplying domes at will in the same interior. (See **DOVE**.) It was in the abstract a higher form of architecture than either Roman or early Christian, and was the real link between Rome and the Middle Ages, because it showed how the vaulting systems of Rome could be adapted to the form of the Christian Church, and, taking up the dome at the point to which the Roman architects had developed it, carried it a step further and made possible all styles of architecture that have come, even after the Renaissance. The Romans had gone no further in weakening the solid circular wall that supported their domes than to cut niches in it; the early Christian architects had gone a step further and turned the lower part of this wall into a colonnade, which opened into one or more concentric aisles. But the Byzantine architects of Asia Minor invented the pendentive, which made it unnecessary that the supports should follow the outline of the dome. The preliminary stages are shown in buildings like San Vitale at Ravenna, the cathedrals of Ezra and Bosra in Syria, and Saints Sergius and Bacchus at Constantinople, all built early in the Sixth Century. Then came the masterpiece, Saint Sophia (q.v.) at Constantinople, built by Anthemius (q.v.) and Isidore, architects of Asia Minor, who here suspended the Pantheon dome in the air far more truly than Michelangelo did at Saint Peter's. Its two great semi-domes flanking the central dome made possible an oblong plan without breaking the unity. The apse, side aisles, and galleries are all more thoroughly subordinated to the central nave than in any other Christian structure. (For details, see under **SAINT SOPHIA**.) No other Byzantine church undertook to rival or imitate, even in plan, Saint Sophia. The great variety in plan and elevation of Byzantine churches is in strong contrast to the uniformity of early Christian churches. Some are in the form of a Greek cross, like Saint Mark's in Venice, with five domes; the commonest form is oblong, with each bay covered by a small dome. Usually there is a central dome, raised on a drum above the rest, and sometimes cross-vaults or tunnel-vaults take the place of minor domes. In course of time the churches became smaller, the domes were erected on higher drums, the closed porch or narthex became larger and was usually domed, the exteriors, instead of being of plain bricks, had alter-

nate courses of brick and stone or marble, and were diversified by inset panels and patterns in relief, as well as by pilasters and arcades. Saint Irene represents the middle and the Theotokos and Pantokrator the final stage of this development at Constantinople. The churches of the Apostles, of Saint Elias, and of the Virgin at Salonica are among the most exquisite of this class in proportions and details, with tower-like domes and effective exteriors. In Greece proper the city churches, like the cathedrals at Athens and Mistra, are very small, and are excelled in size and decoration by the monastic churches, such as those of the Basilians at Chios, Mount Helicon (Saint Luke), Daphne, and Mount Athos, built between the Tenth and Fourteenth centuries. On a somewhat larger scale were the churches in the East. Syria, as shown by such churches as those of Damascus, Dana, Antioch, Edessa, held mainly to the basilical style up to the time of the Persian and Mohammedan invasions of the Sixth and Seventh centuries, which put an end to Christian architecture in that region. But Asia Minor, the source of Byzantine domical construction, still shows many churches of this style, such as those at Myra, Ancyra, Cassaba, Ephesus, Nicæa; Armenia, Georgia, and the Caucasus adopted for a period a pure Byzantine style, while at other times they developed local peculiarities, such as stone construction, pitched roofs, polygonal domes, carved ornamentation, etc. Churches at Ani, Digbur, Pitzunda, Etchmiadzin, etc., show how active this region was under its kings between the Tenth and the Fourteenth centuries. Near them was Trebizond, which shows churches belonging to the time in the Thirteenth Century when it was the Byzantine capital, while Constantinople was occupied by the Crusaders. Passing eastward, we find that the Byzantine style has penetrated into the northern provinces connected with the Empire of the East, into Serbia and other Danubian provinces (as at Kurte d'Arjish, Studenitz, and Semendria), and into Russia (Saint Sophia at Kiev), where Slavic taste degraded it gradually until the bulbous domes and exaggerated and overloaded details placed Russian Byzantine architecture upon a level with Mongol and Indian monuments.

Byzantine architecture existed even beyond the political limits of the Empire. Parts of Italy were pervaded by it between the Sixth and Twelfth centuries. Ravenna is a well-known example of the earliest period, with its San Vitale, its mausoleum of Galla Placidia, and its baptisteries. Venice also was an outpost of the East. Saint Mark's was a reproduction of the Church of the Apostles at Constantinople, with its five domes on a Greek cross and with its superb series of mosaic and marble decorations. It is decoratively at least a better representative of Byzantine art than Saint Sophia. The earliest palaces of Venice also are thoroughly Byzantine not only in style, but in plan, as, for instance, the Fondaco dei Turchi and many of smaller size but better preservation. Santa Fosca at Torcello is also purely Byzantine. Farther south it is common to find Byzantine influence combined with Mohammedan. This is the case in Sicily—as in the Eremitani and San Cataldo at Palermo—and in Campania. But throughout Calabria the churches are as purely Byzantine as in Greece, and other examples are scattered

BYZANTINE ARCHITECTURE
INTERIOR OF THE CHURCH OF ST. SOPHIA, CONSTANTINOPLE

elsewhere, as the cathedral at Capri and San Germano at Monte Cassino. Even Germany (Aix-la-Chapelle, Paderborn) and France (whole of Périgord, especially Saint Front at Périgueux), were sporadically invaded. It was natural that the less civilized northern and eastern nations on the borders of the Byzantine dominion should receive its architecture. The monuments of the countries in the northern part of the Balkan Peninsula are of this class. Serbia, Bosnia, Bulgaria, all borrowed from Byzantium, and it was the same even with the more powerful States.

The main classes of Byzantine architecture are: (1) Churches; (2) monastic establishments; (3) palaces; (4) fortresses. So little remains of minor classes, such as private houses, hospitals, fountains, civil edifices, etc., that we can get only vague ideas as to their style. The imperial palace at Constantinople exists no longer except in the descriptions of its gorgeousness. The fortresses have frequently survived and serve to show that in Africa, Syria, and Asia Minor they served as models to the Mohammedans, and subsequently to the Crusaders, thus revolutionizing the military architecture of Europe, as well as the East. The monastic establishments are even more important for architectural history than the corresponding ones in the West (see MONASTERY), because Byzantium always remained subject to monastic art, whereas Europe was so only for a short time. There were of course certain great centres of monastic architecture, such as the Mount Athos monasteries, those of Thessaly (Meteora), the Stoudion near Constantinople, and Saint Simeon Stylites in Syria; but the monastic influence was not concentrated, as in the West, in a few large establishments, nor did the monks, as there, shun the cities. Every city was filled with them, and there were few churches that had no monastery attached to them. Among good examples are the monastery of the Eleventh Century on the island of Chios, that of Daphne, and Saint Luke on Mount Helicon in Greece, of the same period; but greatest of all is Mount Athos (q.v.). The Byzantine architects made but little use of concrete; building of brick, they were able to decrease the thickness of their walls. For their domes they used hollow conical bricks of very light clay, which fitted into each other. This gave a minimum of weight and a maximum of cohesion. Although they did not use any flying buttresses nor advertise their methods of construction as the Gothic architects did, they nevertheless invented a system of equilibrium through interacting thrusts and a concentration of thrusts upon given points, which, although not apparent, was none the less effective. At Saint Sophia there is a pyramidal progression, the thrust of the dome being received on two sides by semi-domes, on two others by immense buttresses, and then transmitted to the gallery vaults over side aisles and narthex, until it dies away in the low walls of the exterior. But the mathematical knowledge required to carry out the principle successfully on so large a scale was not to survive Anthemius very long. No subsequent attempts equal Saint Sophia. The nearest approach, the palace church of Basil the Macedonian, has been destroyed. In the decoration of their interiors Byzantine architects loved color as much as did the Romans, and they carried it out more thoroughly than the early Chris-

tian architects of the basilical style, for their system was an incrustation of marbles and mosaics far richer than that used in the West, whose architects were often satisfied with thin-colored wall paintings. The entire system of Christian iconography was often given in mosaic pictures, and the lower walls covered with patterns of *opus sectile*. The pavements also were of mosaics. This applies particularly to the central and most strongly Hellenic parts of the Byzantine dominions and less so to frontier provinces, such as Syria, Egypt, and Asia Minor. The classic orders were almost wholly discarded; capitals, friezes, cornices, and plaques were decorated in low relief, basket-work (undercut and openwork), and Oriental patterns, often borrowed from stuffs, and heavy projections were avoided. Sculptural became more and more subordinated to color effects.

SCULPTURE. There are few works of Byzantine figured sculpture, on account of both the Oriental incapacity in drawing the figure after the Roman decadence and the iconoclastic prejudice against images. There are a few early works, such as the Ambone at Salonica, some sarcophagi at Ravenna, the wooden doors of Santa Sabina in Rome, which show how closely akin its style was during the Fifth and Sixth centuries to early Christian sculpture, with added imagination and Hellenic refinements. One of the latest echoes of this stage is the colossal bronze statue of a Byzantine Emperor from Barletta, now in Naples, the last of the imperial statues. The stiffer late Byzantine methods which prevailed between the Tenth and Fifteenth centuries are shown in the Madonna of the cathedral at Ravenna, the reliefs of Christ and angels at the Eski-Diama Mosque in Constantinople, and a few reliefs at the Mount Athos monasteries. While of rare occurrence, works of sculpture never lapsed into the state of barbarism current in Europe from the Seventh to the Twelfth Century, but always retained artistic qualities. Decorative sculpture especially was developed on principles of design more Oriental than classic; the stereotyped orders, anthemion, honeysuckle, egg-and-dart, and pearl motives, being superseded by a great variety of floral, geometric, and animal forms, sometimes free, sometimes schematic in arrangement. The technique also differed from that of classic ornament; the relief was usually slight, the surfaces rather flat, and the effectiveness secured by undercutting or sharp arrises, with violent rather than delicate transition of surfaces. This was carried to an extreme in the 'basket' capitals and similar works, where the design is almost entirely cut away from the ground, and in the altar and choir screens, where the main outlines are cut through the slab. The churches of Ravenna, Parenzo, Venice, Constantinople, and Salonica are rich in such works of the central Byzantine School, while a corresponding but independent development appears in the numerous churches of central Syria, where the design is freer and less like an adaptation of patterns from stuffs applied to sculpture. Byzantine ornament prevailed throughout Italy (except Lombardy) until the Eleventh Century, and lay at the basis of much of Mohammedan design in Egypt, Spain, and the East. It thus, more or less directly, permeated the Middle Ages. The minor branches of sculpture are described under MINOR ARTS.

PAINTING. The methods of fresco or wall painting, of mosaic, and of panel painting were all practiced by the Byzantine School. The less durable wall paintings and panels of the early period have disappeared throughout the East, and it is only from the mosaics that any idea of the history of Byzantine painting before the Twelfth Century can be gained. Its influence was even more universal than that of Byzantine architecture or sculpture, and dominated practically all schools of Christian art until the Renaissance. It was felt even in the later frescoes of the Roman catacombs. The wholesale destruction of examples in the East itself, first by the persecution of the Iconoclasts (q.v.), then by the vandalism of the Mohammedans, has obliged historians to rely largely on examples preserved in the West. The earliest stage appears at Ravenna in the mosaics of the two baptisteries and especially in the mausoleum of Galla Placidia, an exquisite scheme of color and decoration typifying the classic stage of the Fifth Century. The second period (of Justinian) is shown in mosaics at Saint Sophia in Constantinople and at Salonica, and especially in those of San Vitale and Sant' Apollinare Nuovo at Ravenna, in which the mosaics form substantially the entire scheme of internal decoration both figured and ornamental, with scenes from both the Old and New Testaments. Ordinarily, it was only in the apse, the dome, and the triumphal arch that so expensive a form of ornament was employed. There was a period of decadence during the Seventh and Eighth centuries, of which some examples remain in Ravenna (Sant' Apollinare in Classe) and Rome (Sant' Agnese and San Venanzio), though hardly anything remains of this time outside of Italy. During the revival under the Macedonian dynasty (Ninth to the Eleventh Century), the cycle of subjects represented by Byzantine painting was enlarged and systematized into a complete iconographic cycle, which furnished themes and their method of treatment to later art in the West. The most superb single group of monuments in which the mosaicists showed their skill was the imperial palace and chapel at Constantinople. To the close of this period belong the mosaics of Nicaea, of Saint Luke on Mount Helicon, of Chios (monastery of Basilians), of Daphne, and of Saint Sophia at Kiev in Russia; while its earlier years may well be represented by the great series in Santa Prassede at Rome, in Saint Irene at Constantinople, and Saint George at Salonica. With the middle of the Eleventh Century a new stage of activity opens for Byzantine painting. In reality its decadence has commenced, but the revival of art in Europe at that very time gives it a far broader scope beyond the now much-narrowed limits of the Eastern Empire. The Italian States, such as Venice (mosaics of Torcello, Saint Mark's, and Murano) and the Norman kingdom in the south (Cefalù, Martorana, and Capella Palatina at Palermo), employed Byzantine mosaicists, who trained local imitators. The Roman School was newly founded in this manner (Grottaferrata, Santa Maria in Trastevere); so was the great Benedictine School of Monte Cassino under Desiderius. These three centuries (Eleventh to the Thirteenth) furnish for the first time numerous extant frescoes, from the scattered examples in the Greek monastic chapels of Calabria to the

large coördinated series in the monastic churches of Mount Athos and Campania (Sant' Angelo in Formis, Sessa, and San Niccolò near Monte Cassino). Besides these and other centres of Byzantine influence in Italy, the Russian, Bulgarian, Armenian, Georgian, and other schools of painting are founded on Byzantine models. The rules for painting, both as to technical method and treatment and arrangement of subjects, are embodied in manuals, such as that attributed to Panselinus and used for centuries by the painters of Macedonia and Mount Athos (Didron and Durand, *Manuel d'Iconographie Chrétienne*, translated from the Greek, Paris, 1845). These carefully detailed directions, written and arranged in the form of a book, were circulated everywhere, and while facilitating quick execution, called for little exertion of artistic imagination or taste, and hastened the decadence of true art in the Byzantine school. When Italian fresco painting, as well as mosaic painting, was revived in the Thirteenth Century from one end to the other of the peninsula, the native artists went to the Byzantines to be taught. Such leaders as Giunta at Pisa, Margaritone at Arezzo, Guido and Duccio at Siena, Cimabue at Florence, Cavallini at Rome, adopted Byzantine methods wholly or in part. The Fourteenth Century witnessed the complete emancipation of the West, as well as the complete decadence of painting in the East. Such mosaics as those of Bethlehem (Church of the Nativity) and of the Kachriye Djami at Constantinople show the approaches of this decadence, which becomes plain in the mass of frescoes at Mount Athos and Meteora in Thessaly, at Mistra and Trebizond. Since then there has been nothing but lifeless repetition in the monuments of the Greek and Russian churches.

MINOR ARTS. The mediæval artists of the Byzantine Empire excelled in the arts of luxury, decoration, and industry; in the illuminating of manuscripts; the carving of ivory book-covers, boxes, and diptychs; the weaving of tapestries, hangings, and rugs; the making of superb vestments for the priesthood and nobility; the carving of cameos and precious stones, glassware, and falenice; the casting, embossing, chasing, and enameling of works in gold, silver, and bronze. Church treasures and palaces were equally filled with a multitude of such works. The description of the ceremonial of the imperial palace by the Emperor Constantine Porphyrogenetus, the texts relating to Saint Sophia, the report of the embassy of the Lombard Liutprand, and many other texts are confirmed by the surviving examples exported to the West. The superb collection of church vessels in the treasury of Saint Mark's in Venice is mainly part of the loot of 1204 from Saint Sophia. The imperial dalmatica at Saint Peter's in Rome is the most beautiful of Byzantine figured stuffs, which were among the most valuable exports from the East. The enameled reliquary at Limburg (948-59) and the crown of Saint Stephen (1071-78) at Budapest also stand at the head of their class, being surpassed only by the famous Pala d'Oro at Saint Mark's. That the artists of Constantinople often received orders from the West is shown by the bronze doors decorated with designs in *niello* executed for Italian churches in the Eleventh Century, such as those of Amalfi, Monte Cassino, Sant' Angelo, Atrani, and Saint Paul's at Rome. The ivory carvings

still extant are very numerous. The golden ages for their production were the Fifth to the Sixth and the Tenth to the Eleventh centuries, though perfection in this branch of art was more constant than in any other until the Thirteenth Century. Among the most beautiful early pieces are the Monza diptych of Galla Placidia (c.440), the Archangel of the British Museum, the Brescia box, and especially the marvelous episcopal ivory throne at Ravenna. Of later works, some of the finest are the "Virgin and Child," the "Crucifixion" triptych and the "Coronation of Romanus and Eudoxia" in Paris. One especially interesting class is that of the ivory oblong boxes, the only large series that are not religious in character, carved with lifelike scenes of daily life or borrowed from classic legend and myth—a peculiar survival. These can be seen at Sens, Corтона, Florence (Carrand), Saint Petersburg, New York (Metropolitan Museum), London (Saint Kens), and in nearly all large collections of mediæval ivories. Surpassing even the ivories, both in their importance for the history of art and in remaining examples, are the Greek illuminated manuscripts. It was in the East that the first works of this sort were executed. The idea of making pictures of all the main events of the Old and New Testaments in chronological series, starting in this way, passed into the field of monumental painting in the Fifth Century, and was most fruitful in results. The gold ground, the brilliant coloring, the idealistic qualities, and the opposition to realism of this branch of art made it peculiarly suitable as an expression of the Byzantine spirit. It followed the same historic vicissitudes as ivory-carving. The Rossano Gospels, the Vienna and London Genesis, the Vatican roll of Joshua and Topography of Cosmas, the Syriac manuscript at Florence are the leading early works (Fifth to the Sixth Century). For the middle period, with its peculiar combination of asceticism and classic revival, the typical works are the Homilies of Gregory Nazianzen and the Psalter in Paris (Bibliothèque Nationale), and the later Menologium of Basil at the Vatican (Ninth to the Tenth Century). A certain number of manuscripts executed by imperial command are especially magnificent, such as Saint John Chrysostom for Nicephorus Botaniates (1078-81) at Paris, the Panoply for Alexis Comnenus (1081-1118), and the Evangelium for John Comnenus (1118-43) at the Vatican. The decoration has become extremely rich at this time and the figures reduced in size or surrounded by heavy borders. Classic traditions no longer obtain, and asceticism dominates. The connexion with monumental painting during all these centuries has remained very close, and as there is an unbroken series of examples, in contrast to the scarcity and breaks in larger works of mosaic and wall painting, the miniatures supply invaluable material for the history of mediæval painting. In this branch only does the East preserve many examples, in the libraries of many monasteries, such as those of Mount Sinai, Mount Athos, and many more throughout the Levant. Still it is in Western collections, such as the Vatican, Bibliothèque Nationale, and British Museum libraries, that the bulk has found refuge. Being a common object of commerce, these manuscripts, imported to Italy, Germany, and France, furnished local sculptors, painters, and decorators with models and motives in nearly

every branch of art during all the centuries before the Renaissance. Finally, there are a few other categories which may be mentioned, though of lesser importance. There were little portable mosaic tablets, such as the diptychs in the Opera del Duomo in Florence and the Transfiguration in the Louvre, of marvelous delicacy of execution. The panel pictures, which were of considerable size in Italy, appear to have been smaller in the Byzantine School. The remaining examples are mostly later than the Twelfth Century. There are interesting collections at the Vatican, at Ravenna, and at Palermo. Earlier panel pictures are some of the so-called miraculous paintings of the "Virgin and Child," some supposed to be painted without hands. A number are in Rome (e.g. Santi Domenico e Sisto and Santa Maria Maggiore), Venice (Saint Mark's), Bologna (San Stefano), and throughout Italy. Crete was the centre for a school of panel painting, one of its leaders being Rico. It influenced the Italian schools in the Thirteenth Century. In Venice itself was established, in the Eleventh Century, a school of Byzantine painters. In the vexed question of Byzantine influence over European art, there is one point where no reasonable doubt can exist: that in all these minor arts the far more advanced culture of the East furnished the standards, not only for technique and artistic form, but for treatment of theme. The silk and tapestry workers of Sicily, Venice, Rome, and Flanders, the gold, silver, and enamel workers of the Rhine, the mosaicists of Campania and Venice, the panel painters of Tuscany, the ivory-carvers and goldsmiths of the monasteries everywhere, learned their art from Byzantium.

BIBLIOGRAPHY. Bayet, *L'Art Byzantin* (Paris, 1892), is a convenient handbook. The literary sources are collected in Unger, *Quellen der byzantinischen Kunstgeschichte* (Vienna, 1878). In Garrucci, *Storia dell' arte Cristiana* (Prato, 1879-99), are reproduced the miniatures, ivories, mosaics, and other works earlier than the Ninth Century. Kondakoff, *Histoire de l'art Byzantin* (Paris, 1886-91), is a careful study of the history of Byzantine illuminated manuscripts. Labarte, *Histoire des arts industriels* (Paris, 1873), though uncritical, is very important as the only general treatment of all the minor arts, well illustrated. The great collections of Cahier and Martin, *Mélanges d'archéologie* (Paris, 1847-56), and *ib.*, *Nouveaux mélanges d'archéologie* (Paris, 1874), contain many ivories, stuffs, and illuminations. For enamels the best work is Kondakoff, *Geschichte und Denkmäler des byzantinischen Emails* (Frankfort, 1889-92). For an account of the great share taken by the monasteries of Mount Athos, consult Brockhaus, *Die Kunst in den Athos-Klöstern* (Leipzig, 1891); for methods of construction, Choisy, *L'art de bâtir chez les Byzantins* (Paris, 1883); for groups of monuments, Pulgher, *Les anciennes églises Byzantines de Constantinople* (Vienna, 1878); Salzenberg, *Die altchristlichen Baudenkmale von Konstantinopel* (Berlin, 1854); Texier and Pullan, *Byzantine Architecture* (London, 1884). Historical synopses may be found in Essenwein, *Byzantinische Baukunst* (Darmstadt, 1886), in German series of handbooks edited by Durr, and in Kraus, *Geschichte der christlichen Kunst*, I. (Freiburg, 1896).

BYZANTINE EMPIRE, also styled the East Roman, Eastern, Greek, or Later Roman Empire; but a better name is 'the Empire of New Rome.' On the death of Theodosius (q.v.), in 395, the Roman Empire was divided between his two sons, Arcadius, who had the eastern half, with his capital at Constantinople, and Honorius, who had the western half. This event is generally taken for the beginning of the so-called Byzantine Empire, which took its name from Byzantium (q.v.), the ancient name for its capital. It came to an end in 1453, when Constantinople was captured by the Turks.

Arcadius (395-408) was weak and wholly under the domination of his successive ministers, Rufinus, Eutropius, and Gainas, of whom the first and the last were Germans; Gainas, who had murdered Rufinus, was succeeded in power by the Empress Eudoxia. Only after her death, in 404, was Arcadius at all independent. He was succeeded by his son Theodosius II., a boy of 7, who ruled from 408 to 450. During his whole reign the government was ably carried on by his sister Pulcheria, who was noted for her rigid virtue. During his reign the Huns under Attila exacted repeated contributions of money and gifts. Attila's demands ceased as soon as they met with a firm refusal from Marcianus (450-457), whom Pulcheria married after the death of Theodosius. Leo the Thracian (457-474) was elevated to the throne by the German general Aspar, who was all-powerful until he was murdered by the Emperor in 471. Zeno (474-491), son-in-law of Leo, succeeded, although the latter's son Leo II., a boy of 4, was at first proclaimed Emperor. After the death of Zeno his widow married Anastasius I. (491-518), who obtained the Empire through her favor. Justin (518-527) was an Illyrian peasant, of Slav descent; as a soldier of fortune he had risen rapidly. He put an end to the religious troubles which had existed under his predecessors. Leo, Zeno, Anastasius, and Justin were all men of experience, who pursued a cautious policy, recruited an army of natives, and made administrative and financial reforms, and left the treasury full, the army strong, and the Empire intact. But for their labors, the reign of Justinian the Great (527-565) would have been impossible. By his conquests and able administration he raised the Empire to a higher degree of prosperity and power than it was ever again to experience. His entire policy was directed toward unity, and this formed the keynote for the future history of the Byzantine Empire. He sought to bring all under one State, one Church, and one law. The Roman law was compiled and published under his auspices in the form of a monumental code. After his death the Empire declined rapidly. His great enterprises had exhausted the treasury and necessitated heavy taxation. His successor, Justin II. (565-578), without his ability, aspired to greater glory. The Persian War, which he provoked needlessly, drained the resources of the Empire, taxation became a crushing burden, the Avars and Slavs devastated the northern border, the Lombards overran most of Italy. Inefficient or unfortunate rulers succeeded, Tiberius Constantius (578-582), Maurice (582-602), and Phocas (602-610)—until, after the death of the last, Heraclius became Emperor (610-641). He humbled Persia, which had been the great opponent of Byzantium, and by

628 he had restored the Empire to its old supremacy in the East and was hailed as 'the new Scipio.' But the provinces of the Empire were exhausted by the long wars and had suffered from the hostile occupation. Consequently, when the Arabs began their great missionary conquests the emperors were too weak to oppose them successfully and were forced to see one after another of their provinces wrested from their grasp. The house of Heraclius furnished two other able emperors—Constans II. (641-668) and his son, Constantine (668-685), who fought bravely against the Mussulmans and checked their advance. But the reign of Justinian II. (685-695 and 705-711) was disastrous, and after his death anarchy brought the Empire to the verge of ruin. The rebel, Leo the Isaurian (717-741), saved the State. He defended Constantinople during the long siege by the Saracens, and reorganized the Empire, which, in spite of the efforts and ability of Heraclius and his grandson and great-grandson, had been steadily decaying. Leo's descendants are remembered chiefly for their efforts to restrict the worship of images. (See *ICONOCLASM*.) But this is not just, as the Empire gained in strength and prosperity under the Isaurian dynasty. Constantine Copronymus (741-775) was a great warrior and extended the boundaries of the Empire both in Asia and Europe. He reformed the administration, planted colonies along the frontiers, and encouraged commerce. His son, Leo IV. (775-780), was able, but he was succeeded by his son, Constantine (780-797), a boy of 9. The latter was under the guardianship of his mother, Irene, until he was 21. Then the two reigned conjointly until 797, when Irene had her son blinded and deposed. Her five years of rule (797-802) were very disastrous to the Empire. Nicephorus I. (802-811) was compelled to pay tribute to the Caliph Harun-al-Rashid in order to make peace with him, and was slain by the Bulgarians. After two years of disaster, Leo the Armenian (813-820) defeated the Bulgarians and began a prosperous reign, only to be murdered by conspirators. Under Michael the Amorian (820-829) the Saracens conquered Crete and began the subjugation of Sicily. His son, Theophilus (829-842), was engaged in almost constant warfare, bloody but indecisive, with the Caliphs. His reign, however, was prosperous at home, and he was renowned for his justice and the great buildings which he constructed. The Empire in his time was wealthy, and Constantinople was the centre of European trade. His son, Michael III. (842-867), was only 4 years old when he became Emperor. He grew up a drunkard, and no one attempted to revenge his death when Basil the Macedonian (867-886), whom he had made co-Emperor, caused him to be murdered.

Under the emperors of the Macedonian line the government was strengthened by the regular transmission of the imperial power. In fact, the whole period from 717 to 1057 was a time when the Empire was on the whole prosperous, well administered, and triumphant. Basil was successful in all his wars, except in Sicily, where Syracuse was captured by the Saracens in 878. He had great ability; his code of laws remained in use for centuries. His son, Leo the Wise (886-912), and his grandson, Constantine Porphyrogenitus (912-959), were literary men of no mean ability. Fortunately, the Empire was pros-

perous and its enemies were weak. Romanus II. (959-963), son of Constantine, reconquered Crete through his able general, Nicephorus Phocas. The latter became Emperor (963-969) by marrying Romanus's sister, but he ruled the Empire in the name of his two step-sons, Basil II. (963-1025) and Constantine VIII. (963-1028), and the same was done by John Zimisces (969-978), who murdered Nicephorus and married his widow. Like Nicephorus, John Zimisces was an able soldier. He defeated the Russians and reconquered Antioch and Edessa from the Saracens. Basil II. succeeded to the Empire, crushed the Bulgarians, and extended his dominions farther than any Emperor since Justinian. Constantine VIII. was sole Emperor from 1025 to 1028. He had taken little part in the government before and was very weak. On his death without a son the husbands and creatures of his daughter Zoë ruled the Empire for twenty-six years. It was on the whole a very disastrous period. But Theodora, Zoë's sister, who ruled from 1054 to 1057, was able and virtuous. With her the Macedonian line ended.

For twenty-six years there was a succession of emperors of little importance, none of them able to cope with the Seljukian Turks, who rapidly conquered all of the Asiatic possessions of the Empire. Alexis Comnenus (1081-1118) was compelled to face new dangers from the attacks of the Normans and the armies of the Crusaders. He struggled bravely and was successful in many respects. But, unfortunately, the finances of the Empire were seriously impaired by the diversion of commerce from Constantinople occasioned by the growth of the Italian cities and the foundation of the Kingdom of Jerusalem. In addition, the policy of Alexis caused the Greeks to be bitterly hated by the Crusaders. Alexis was succeeded by John the Good (1118-43), who was vigorous and warlike. He was constantly engaged in fighting the Seljuks, Hungarians, Serbians, and Armenians. Manuel Comnenus (1143-80) engaged in many wars for his own personal glory, but neglected the finances and government, so that he left the Empire in a bad condition. In the next twenty-four years incompetent rulers brought the Empire to the verge of ruin. Cyprus was lost, Bulgaria became independent, and the Seljuks threatened to conquer Constantinople. The Venetians were hostile, and allied themselves for an expedition with the Crusaders, who coveted the riches of Constantinople, which seemed to them fabulous. In 1204 Constantinople was taken and sacked and the Latin Empire established. This was very weak and lasted only until 1261, when Michael Palæologus, the ruler of Nicæa, the strongest of the Greek States which had arisen when the capital was captured by the Franks, expelled the Latins and reestablished a Byzantine Empire. But this empire was much smaller than it had been in 1204, and the ruling family, the Palæologi, were unable to make it powerful. Michael VIII. (1261-82) attempted to gain allies by offering to bring the Greek Church under the authority of the Pope. His son, Andronicus II. (1282-1328), was utterly incompetent, and the last years of his reign were filled with civil wars. A period of disaster followed. The command of the sea was lost, the finances were in hopeless disorder, and the rulers were weak. The Ottoman Turks were now establishing their power on the ruins of the Seljukian

realm in Asia Minor, and one by one they conquered the provinces of the Empire. Under John V. (1341-91) the Turks made their first permanent conquest in Europe by seizing Gallipoli in 1354. Manuel II. (1391-1425) and John VI. (1425-48) were feeble rulers and practically vassals of the Sultan. Constantine XIII. (1448-53) struggled bravely but unsuccessfully to retain his capital, the only portion of the Empire which was left, and finally, in 1453, Constantinople was taken by the Turks. The capture of the capital marks the end of the Byzantine Empire.

Until recently it has been the fashion to treat the Byzantine Empire with contempt. Gibbon described its history as "a tedious and uniform tale of weakness and misery." Voltaire spoke of it as "a worthless repertory of declamation and miracles, disgraceful to the human mind." Montesquieu wrote: "The history of the Greek Empire, from Phocas on, is merely a succession of revolts, schisms, and treacheries." Taine condemned it as "a gigantic moldiness lasting a thousand years." In 1854 a writer in an English review "rejoiced over the supposed moment when the last Byzantine historian was blown into the air by our brave allies the Turks." But in the last half-century all this has been changed. Scholars now recognize the inestimable debt which we owe to the Byzantine Empire. They realize that for eight centuries the Roman Empire, transplanted to New Rome, i.e. Constantinople, persisted in its task; that law, literature, industry, and commerce did not cease to flourish; that Constantinople stemmed the tide of invasion from the East, which otherwise might have engulfed all Europe. They have learned that the most striking feature of Byzantine history is "its constant vitality and power of revival," its "marvelous recuperative energy," shown at every crisis in its history.

It is impossible to characterize this history as a whole, because it covers a period of time greater in length than the history of England from the Norman Conquest to the present day. For more than a thousand years dynasties changed, wars and revolutions took place, the fortunes of the Empire sank and rose again. Of the 107 persons who ruled from 395 to 1453 as emperors or associates of emperors, 20 were assassinated, 18 were blinded or otherwise mutilated, 12 died in a monastery or a prison, 12 abdicated under compulsion or of their own free will, 3 died of starvation, 8 died in battle or as a result of accident—a total of 73. Vice, corruption, and cruelty were the dominant features at some periods; the government was despotic; the people were superstitious, effeminate, and servile. Yet the Empire lived on; the administration and organization remained effective; the traditions and civilization of old Rome were maintained. Great wealth, which was a source of wonder to all visitors, was accumulated, and great armies, which were the most effective in the world, were maintained. If any scholar, in spite of the complexity of Byzantine history, should attempt a generalization, probably he would say, as Frederic Harrison has said—"first, that the Byzantine Empire preserved more of the tradition, civil and military organization, wealth, art, and literature of the older Rome than existed elsewhere; and, secondly, that in many essentials of civilization it was more modern than the nascent nations of the West." These are the

two facts which are most striking, its antiquity and modernity, and just here is one of the reasons why Byzantine history is not attractive to us; its antiquity seems only an aping of the past; its modernity fails to interest us because we have reached a higher development than the Byzantine Empire ever did.

New Rome, like old Rome, had a wonderful capacity for absorbing and assimilating less civilized peoples. The Empire included representatives of all the races of eastern Europe. It opened to all full participation in its life. Its emperors might be of any nationality. Any barbarian of ability, if baptized, was welcome to its army, administration, and Court. This was one of the causes of its strength. A second was the position of Constantinople. The city could not be reduced by starvation. Its walls, until 1204, proved strong enough to defy all invaders. Then, too, while the Western Empire was being overrun by the barbarians, the Asiatic provinces of New Rome enjoyed an almost continuous peace. From their wealth the Empire secured the resources necessary to hold its European possessions, and to carry on the wars of Justinian. Finally, it was fortunate in having a large number of able emperors. Most of them were not brilliant personalities who command admiration, but rather cautious administrators, indefatigable workers, who labored slowly and steadily to strengthen the Empire, to fill the treasury, and to improve the administrative service.

The Empire, although conservative, was not wholly unprogressive. This is exemplified in its military organization, its law, its art, and its manufactures. Thus, after the battle of Adrianople (q.v.), the Byzantines realized the fact that the old infantry army was no longer efficient, and formed a new army mainly of cavalry. The infantry they supplied with bows and lances in place of swords and javelins. They developed armor for protection. They used a smaller and more effective tactical unit than the old legion, and they recruited an army of subjects, not mercenaries. They developed the art of fortification and the use of Greek fire. They built a great navy. Oman says: "The art of war as it was understood at Constantinople in the Tenth Century was the only system of real merit existing in the world; no Western nation could have afforded such a training to its officers till the Sixteenth, or we may even say the Seventeenth Century." The *Corpus* of Justinian continued for centuries to be the law of the Byzantine Empire. But it was constantly modified and expanded to suit new conditions. In the Ninth Century a new code was drawn up (see *BASILICA*) in which the influences of Christianity and advancing civilization are marked. In the Eighth Century a maritime code, a military code, and a rural code were developed to meet the changed conditions. The first, especially, is of great importance in the history of legal ideas. Byzantine art (q.v.) is treated at length elsewhere. Here it deserves mention as an indication of the great influence which the Byzantine Empire exercised on Russia, on the Mohammedan caliphates in the East and West, on the south of Italy, on Venice, and on some parts of France and Germany. To-day examples of Byzantine architecture are to be found in every Christian and Mohammedan country. In the manu-

facture of mosaics, silks, and embroidered satins, the Byzantine Empire was preëminent for centuries. The samite and sendal of the mediæval romances came from Constantinople.

The direct services of the Byzantine Empire to Europe were many and varied. Four, in particular, deserve emphasis. (1) It was the bulwark of Europe from which host after host of invaders were beaten back. For seven centuries, almost unaided, it bore the brunt of every attack, and thus enabled the Western nations to develop and gain strength. (2) It preserved the Greek and Roman culture and transmitted it to western Europe as the people of the younger nations became sufficiently advanced to share in the priceless heritage. Some of this culture was constantly filtering through, but during the period of the Crusades and later the transmission was most marked. (3) It maintained the world's commerce, which for centuries was centred at Constantinople. The pupils whom Constantinople had formed, Venice and Amalfi, wrested the sceptre of the seas from her only in the Eleventh Century. (4) It was the civilizer of all eastern Europe, where the influence of the Greek Church, Greek art and architecture, and Greek administration is everywhere evident at the present day.

BIBLIOGRAPHY. The original authorities for the history of the Byzantine Empire are the authors whose works are included in the collection of the Byzantine Historians. The first edition was published in Paris, in thirty-six volumes, between 1648 and 1711. This collection was reprinted with additions in Venice, 1727-30. In the Nineteenth Century, Niebuhr, assisted by Bekker, the Dindorfs, and others, edited the so-called 'Bonn Edition' under the name of the *Corpus Scriptorum Historiæ Byzantinæ*. But this last edition is extremely unscholarly. There are separate editions of the most prominent chroniclers, which will be found under their respective names. Of the secondary works, the following may be mentioned: Finlay, *History of Greece from B.C. 146 to A.D. 1864*, edited by Tozer (7 vols., Oxford, 1877); Gibbon, *Decline and Fall of the Roman Empire*, edited by Bury (7 vols., London, 1896-1901); Krumbacher, *Geschichte der byzantinischen Literatur* (Munich, 1897); Bury, *The Later Roman Empire* (New York, 1889); Heyd, *Histoire du commerce du Levant au Moyen Age* (Leipzig and Dessau, 1885); Krause, *Die Byzantiner des Mittelalters in ihrem Staats-, Hof- und Privatleben* (Halle, 1869); Rambaud, *L'empire grec au X^e siècle* (Paris, 1870); Pears, *Fall of Constantinople* (New York, 1885); Oman, *Byzantine Empire* (London, 1892); Harrison, *Byzantine History in the Early Middle Ages* (London, 1900). The last gives an excellent select bibliography of the monographs on special phases of Byzantine history. Very useful bibliographical clues can also be found in the appendices and notes to Bury's edition of Gibbon.

LIST OF EMPERORS OF THE BYZANTINE EMPIRE

Arcadius, 395-408.	Justinian I., 527-565.
Theodosius II., 408-450.	Justin II., 565-578.
Marcelian, 450-457.	Tiberius Constantinus, 578-582.
Leo I., the Thracian, 457-474.	Maurice, 582-602.
Zeno the Isaurian, 474-491.	Phocas, 602-610.
Anastasius I., 491-518.	
Justin I., 518-527.	

HERACLIAN DYNASTY, 610-717

Heraclius I., 610-641.
Heraclius Constantinus, 641.
Heraclionas, 641.
Constantinus (Constans II.), 641-668.
Constantine IV. or V., *Pogonatus*, 668-685.
Justinian II., 685-695.
Leontius, 695-697.
Tiberius Apsimarus, 697-705.
Justinian II. (restored), 705-711.
Philippicus Bardanes, 711-713.
Artemius Anastasius, 713-716.
Theodosius III., 716-717.

SYRIAN (ISAURIAN) DYNASTY, 717-820

Leo III., the Isaurian, 717-741.
Constantine V., or VI., *Copronymus*, 741-775.
Leo IV., the Chaza, 775-780.
Constantine VI. or VII., 780-797.
Irene, 797-802.
Nicephorus I., 802-811.
Stauracius, 811.
Michael I., *Rhangabe*, 811-813.
Leo V., the Armenian, 813-820.

AMORIAN DYNASTY, 820-867

Michael II., the Stammerer, 820-829.
Theophilus, 829-842.
Michael III., the Drunkard, 842-867.

BASILIAN OR ARMENIAN (MACEDONIAN) DYNASTY, 867-1057

Basil I., the Macedonian, 867-886.
Leo VI., the Wise, 886-912.
Constantine VII., or VIII., *Porphyrogenitus*, 912-959.
Alexander, associate Emperor, 912-913.
Romanus I., *Leapenus*, 919-944. (Associate Emperor together with his three sons, Christopher, Stephen and Constantine.)
Romanus II., 959-963.
Basil II., *Bulgaroctonus*, 963-1025.
Nicephorus II. Phocas, 963-969, associated with Basil II.
John I., *Zimisceas*, 969-976, associated with Basil II.
Constantine VIII. or IX., 1025-1028.
Romanus III., *Argyros*, 1028-1034.
Michael IV., the Paphlagonian, 1034-1041.
Michael V., 1041-1042.
Constantine IX. or X., *Mona-machus*, 1042-1055. (Reigns with his wife Zof.)
Theodora, 1055-1056.
Michael VI., *Stratioticus*, 1056-1057.
Isaac I., Comnenus, 1057-1059.
Constantine X. or XI., *Ducas*, 1059-1067.
Eudocia (in the name of her sons, Michael VII., Andronicus and Constantine, and with her second husband, Romanus IV.), 1067-1071.
Michael VII. (see above), 1071-1078.
Nicephorus III., *Botanlates*, 1078-1081.

COMNENIAN DYNASTY

Alexius I., Comnenus, 1081-1118.
John II., or Caloiohannes, Comnenus, 1118-1143.
Manuel I., Comnenus, 1143-1180.
Alexius II., Comnenus, 1180-1183.
Andronicus I., Comnenus, 1183-1185.

THE ANGELOIAN DYNASTY

Isaac II., Angelus, 1185-1195.
Alexius III., Angelus, 1195-1203.
Isaac II. (restored), 1203.
Alexius II., Angelus, 1204.
Alexius V., *Ducas*, 1204.

LATIN EMPERORS OF THE EAST

Baldwin I., 1204-1206.
Henry of Flanders, 1206-1216.
Peter of Courtenay, 1216-1219.
Yolande, 1219-1221.
Robert, 1221-1228.
John of Brienne, 1229-1237.
Baldwin II., 1237-1261.

NIOKEAN EMPERORS

Theodore I., *Lascaris*, 1206-22.
John III., *Ducas*, 1222-54.
Theodore II., *Ducas*, 1254-58.
John IV., *Ducas*, 1258-60.

THE EMPIRE RESTORED: THE PALEOLOGI

Michael VIII., Paleologus, 1261-82.
Andronicus II., Paleologus, 1282-1328.
Andronicus III., Paleologus, 1328-41.
John V., Paleologus, 1341-51.
John VI., *Cantacuzenus*, 1347-1354.
Manuel II., 1391-1425.
John VII., 1425-48.
Constantine XI., 1448-53.

BYZANTINES. In numismatics, the term applied to coins of the Byzantine Empire. Byzantine coins are of gold, silver, and bronze; bear impressions distinct from those of the

earlier Roman coins; and were copied in several countries where the Byzantine standard was adopted. The commercial relations of the Eastern Empire served to distribute its coinage over almost all the then known world. It was current in India, as well as in the north of Europe. Consult Saulcy, *Essai de classification de suites monétaires byzantines* (Metz, 1836), and see BESANTS.

BYZANTIUM, bí-zăn'-shí-üm (Gk. *Βυζάντιον*, *Byzantion*). A city which stood on the Thracian Bosphorus, at the east end of the Propontis. It was founded about B.C. 660, by Dorian colonists, probably from Megara, and rapidly rose in importance as a seat of commerce. Its position was at once secure and enchanting; it commanded the shores of Europe and Asia, and had magnificent facilities for trade. After a time of subjugation under Darius Hystaspis, Byzantium was occupied by the Spartan general Pausanias. Later the city joined the Delian League, and its importance is shown by its large contributions. At the time of the Samian revolt (B.C. 440), Byzantium seems to have tried to withdraw, but reappears in the tribute lists two years later, and remained loyal to Athens until B.C. 411, when it joined Sparta. Retaken by Alcibiades (B.C. 409), it was again captured by Lysander after the battle of Ægospotami. Spartan tyranny led to a change of feeling, and about B.C. 390 Thrasybulus, the Athenian, re-established the democracy, and before B.C. 378 Byzantium concluded a treaty of alliance with Athens. This friendship was of short duration, and finally, in B.C. 357, Byzantium leagued itself with Chios, Rhodes, and King Mausolus II. of Caria, in the Social War. In B.C. 341-40 Philip of Macedon advanced against the city, and, under the influence of Demosthenes, the citizens once more joined Athens. Under Alexander the Great and his successors, Byzantium retained its independence, but for some years after B.C. 278 was subject to a heavy tribute imposed by the Celts. The duties imposed to meet this burden led to a war with Rhodes, in which the city was supported by Attalus I. of Pergamum. During the Roman wars Byzantium seems to have supported Rome, and, as a result, in spite of some suffering in the Mithridatic wars, enjoyed considerable prosperity. In the civil war between Septimius Severus and Pescennius Niger, Byzantium sided with the latter. It was, therefore, besieged by Severus, and, after a brave defense of three years' duration, was captured in A.D. 196 and reduced to ruins. Severus, repenting the desolation which he had made, rebuilt a part of the city, ornamented it with baths, porticoes, etc., and restored to the inhabitants their ancient privileges. In A.D. 330, after the defeat of Licinius, Constantine made the city the capital of the Roman Empire, under the name of Constantinople (q.v.).

C

C The third letter in the Latin, as in all alphabets, like the Romance and English, that are derived from it. In position the letter *c* corresponds to the Greek gamma (Γ) from which its form is actually derived through curvature or rounding. Its shape is ultimately traceable, it is thought, to a hieroglyphic pictograph for a throne. See ALPHABET.

PHONETIC CHARACTER. In sound the Latin *c* originally had the same force as the Greek gamma (Γ) from which it is adapted, and this old value is seen in such Latin abbreviations of proper names as *C.* for *Gaius*, *Ch.* for *Gnaeus*; but in Latin *C* later began to take on the force and function of *K*, which was falling into disuse, and a new letter *G* (a modification of *C*) was introduced to represent that voiced guttural *g*-sound. (See *G*.) The *k*-sound of *c* continued in Latin down to at least the Eighth Century of the Christian Era; and that is also its power in the Anglo-Saxon or Old English, when 'king' is written *cyning*, and 'queen' *cwēn*, as there was no *q* during that period. The later differentiation or changes of the sound of *c* from the old stop or *k*-sound in *come* to the hissing or sibilant *s*-sound in *cetaceous*, with similar modifications, is largely due to the influence of a following *i*, *e*. These front vowels being farther forward in the mouth than *a*, *o*, *u*, tend to change the character of the checked sound into a split or hiss. As examples of such sibilant developments, compare the pronunciation of Latin *Cicero* (Kikero), Italian *Chichero*, English *Siscero*, or again the common English pronunciation of *vici*, 'I conquered' ('vis') instead of 'wēkē'), in *veni, vidi, vici*. Of like character is such an interchange as Latin *centum*, 'hundred'; Sanskrit, *śata*. Examples of palatalization or splitting of *c* to *ch*, before *i*, *e* are especially common from Anglo-Saxon into modern English, through the Southern Dialect—e.g. AS. *cild* (*kild*), Eng. *child*; AS. *ccorl*, Eng. *churl*; AS. *sēcan*, Eng. *seck* and *beseck*; or, again Lat. *caput*, 'head'; Fr. *chef*, Eng. *chief*; Lat. *canto*, Eng. *chant*. The phonetic laws governing such interchanges as *c* with *g*, *h* in the Indo-Germanic languages may be better understood by pronouncing in succession the syllables *ac*, *ca* (with perfect closure), *ag*, *ga* (with the same closure, but voiced), and *ah*, *ha* (with imperfect closure); hence, such alternates as Lat. *ager*, 'field,' Eng. *acre*; Lat. *duc* (lead, draw), Eng.

tug; Lat. *canis*, 'dog.' Gk. *kuv-*, *kun-*; AS. *hund*, 'hound.' (See PHONETIC LAWS.) In usage, as a letter compared with *k*, the Germanic alphabets, which are under obligation to the Greek as well as to the Latin, adopted *k*, from the Greek *kappa*, to represent the guttural sound. For this reason, *c* in German and Swedish, etc., hardly occurs outside of words of Romance origin. In Modern English *c* is practically superfluous, as far as sound-representation is necessarily concerned; the letter *k* might easily take its place in recording the stop-sound of *c* before *a*, *o*, *u*, and the letter *s* might readily be substituted for the hissing sound of *c* before *e*, *i*.

AS ABBREVIATION. In music *C* is the first tone, or keynote of the diatonic scale of *C* major. *C* = 100; *C.* = Centigrade (thermometer scale); B.C. = before Christ; *c.* = *cent*, *centime*, etc.; and it is used in some other familiar abbreviations.

CAABA, kā'bā or kā'a-bā. See KAABA.

CAAING (kā'ing) **WHALE** (Scotch *ca. coa.* to drive), or **BLACKFISH**. A large, porpoiselike cetacean, of the Killer family (Delphinidae) and genus *Globiocephalus*, principally characterized by its globose head. They go in large schools, crowding after a leader; and as they yield a fair amount of oil similar (but inferior) to sperm-oil, and their flesh is savory, they are incidentally an object of the sea-chase. The caaing whale proper (*Globiocephalus melas*) is 20 feet long, black, with a white abdominal area, has very long and narrow pectoral fins, and inhabits the colder parts of the Atlantic, appearing on our coast southward to New York, south of which it is replaced by a short-finned black species (*Globiocephalus brachypterus*). The Pacific has a widespread species (*Globiocephalus scammoni*), wholly black, and much pursued by whalers. The food of all is mainly squids, but fish are also eaten. See WHALE.

CAAMA, kā'mā, or KAAMA. (1) A small South African fox or fennec (*Fennecus caama*), now rare, whose fur is valuable. It has the habits of a fennec (q.v.), and lives largely on the eggs and young of ostriches and other ground-building birds. It is also called 'asse'.

(2) See HARTBEEST.

CAAZAPA, kā'a-sū'pā. A town of the Republic of Paraguay, situated 25 miles south of Villa Rica, with which it is connected by rail-

road (Map: Paraguay, F 9). It is the centre of a fertile agricultural region. Population, about 12,000.

CAB. See CARRIAGE.

CABABISCH, ká-bá'bësh. An Arab tribe in Africa, inhabiting the immense deserts of eastern Sudan, between Dongola, Darfur, and Kordofan.

CABAL' (Fr. *cabale*, from *cabbala*, on account of its secrecy). The designation of an unpopular English ministry (1667-73), composed of (Clifford, Ashley, Buckingham, Arlington, and Lauderdale, the initials of whose names coincidentally spelt Cabal).

CABALLERO, ká-bá-lyá'ró, FERNAN (1797-1877). The pseudonym of Cecilia Böhl von Faber, a Spanish novelist. She was born in Switzerland and educated in Germany, but in 1813 accompanied her father to Spain, and soon became enthusiastically attached to her adopted country. She was married three times, her last husband being a lawyer named Arrom. Her first novel, *La Gaviota*, was published in 1849, and was followed by many others, the chief of which are: *The Alvareda Family* (1880); *Clemencia* (1887); and *Elia*. She also published the first collection ever made of Spanish popular tales and poems, *Cuentas y poesías populares andaluces* (1859). Her principal novels have been translated into most European languages.

CABANATUAN, ká-bá'ná-twán'. A town of Luzon, Philippines, in the Province of Nueva Ecija, situated 16 miles north of San Isidro. It has a telegraph station. Population, in 1898, 12,000.

CABANEL, ká-bá'nél', ALEXANDRE (1823-89). A French painter. He was born in Montpellier, September 28, 1823, studied with Picot, and was practically, during the latter years of his life, the unofficial head of French art, inasmuch as he was consulted concerning all functions of which art formed a part. He devoted himself after 1860 mainly to portrait painting, and he was peculiarly fitted, by his taste and distinction of style, to portray aristocratic France. His portraits always possessed the distinguished air which we associate with the bearers of old names of the Faubourg Saint-Germain. He also painted subjects from romantic literature and history. He was a member of the Institute and of the Académie des Beaux Arts, where he was a professor for many years, turning out from his class more successful competitors for the Prix de Rome than any other instructor in that institution. Among his imaginative works were: "Francesca da Rimini;" "Aglæ;" and "The Birth of Venus." A large number of his portraits were painted for Americans; that of Miss Catharine Wolfe is now in the possession of the Metropolitan Museum, New York. At the same museum are his "Queen Vashti and King Ahasuerus" and "Birth of Venus." Consult Strahan, *A History of French Painting* (New York, 1899).

CABANIS, ká-bá'nēs', JEAN LOUIS (1816-). A German ornithologist, born in Berlin, and educated at the university there. In 1839-41 he made ornithologic researches in North and South Carolina, and in 1849 was appointed custodian of the ornithological collections of the Berlin Zoölogical Museum. The investigations which

had so important an effect in determining a natural system of classification were published by him first (1847) in Wiegmann's *Archiv für Naturgeschichte*, and more fully in the *Museum Heineanum* (4 parts, Halberstadt, 1850-63). He founded the *Journal für Ornithologie* in 1853. His other works include the ornithological portions of Schomburgk's *Reisen in Britisch-Guayana* (Berlin, 1848), and of von der Decken's *Reisen in Ostafrika* (Berlin, 1869).

CABANIS, PIERRE JEAN GEORGES (1757-1808). A French physician and philosopher. He was born in Cosnac; studied in Paris, and in the year 1773 went to Warsaw as secretary to a Polish magnate. On his return to Paris, he was for some time engaged in literary pursuits, from which he turned his attention to the study of medicine. During the Revolution, whose tendencies he fully approved, he became the warm friend and physician of Mirabeau. After the death of the latter, in order to refute the charge of having poisoned him, Cabanis published the *Journal de la maladie et de la mort de Honoré de Mirabeau* (1791). Among the papers of Mirabeau was found an extensive work on public education in the handwriting of Cabanis. This had been used by Mirabeau in his public discourses. Cabanis took a leading part in the reorganization of the French schools of medicine and held several professorships in them. He was one of the Council of Five Hundred, and afterwards a member of the Senate. The contributions of Cabanis to philosophy and science may be briefly summed up as follows: In the first place, he was the first to demonstrate empirically the reciprocal influence and the ultimate unity of life and mind, a unity which Herbert Spencer presents as the fundamental principle of inductive psychology. Further, Cabanis was the first to prove that the newly born living being is not "like a musical instrument which in itself contains neither sounds nor harmony," but that it has more or less well-defined instincts and inclinations; that the form and development of ideas are caused not only by physical agents from without, but also by internal (visceral) impressions—a principle which is at the very foundation of an important part of psychology. In his psychological investigations Cabanis steered clear of metaphysics. Thus he remained strictly within the domain of experiment when inquiring into the origin of psychological impressions and into the influence of age, sex, temperament, disease, diet, climate, etc., on the development of ideas, instincts, and passions. His scientific views on subjects of this nature have led many to believe that Cabanis was a materialist and an atheist. It must be borne in mind, however, that when thought is studied in its dependence on the brain, it could not possibly be treated but as a function of that organ. And if Cabanis speaks of the brain from a physiological point of view as assimilating impressions and secreting thought, just as the stomach digests food, he is not therefore necessarily a materialist. As a matter of fact, in his metaphysical *Lettres sur les causes premières*, in which he formulates his dreams of the ultimate nature of the ego, he clearly expresses his belief in a spiritual and immortal soul and in a personal God. The best edition of Cabanis's chief work, the *Rapports du physique et du moral de l'homme*, was published by Piesse

(Paris, 1844). Consult Dubois, *Examen des doctrines de Cabanis* (2 vols., Paris, 1842).

CABARET (Fr., of disputed origin; Low Lat. *cuparetum*, from Lat. *caupo*, huckster, inn-keeper, has been suggested). A tavern; a public house where beer and spirits are retailed.

CABARRUS, ka'ba'rus', FRANÇOIS, Comte de (1752-1810). A Spanish financier of French birth. He organized the San Carlos Bank and a company for trade with the Philippine Islands; was one of the Council of Finance under Charles III., and proposed many reforms. Under Charles IV. he was accused of embezzlement and was imprisoned, but was soon released and raised to the rank of count. Joseph Bonaparte made him Minister of Finance, in which office he died. His daughter Thérèse, under the name of Mme. Tallien, afterwards Princess of Chimay, was conspicuous in the closing days of the French Revolution.

CABAT, ka'ba', NICOLAS LOUIS (1812-93). A French painter, born in Paris. He was a pupil of Flers, and became one of the leaders of the so-called realistic landscape school. His works include "Pond at Ville d'Avray" (1834); "Winter Day" (1836); "A Spring in the Wood" (1864); "A Morning in the Park of Magnet" (1877).

CABATUAN, ka'ba-twān'. A city of the Province of Iloilo, on the island of Panay, Philippines. It is situated on the River Tigum, and is connected by roads with the important towns on the island. Population, in 1898, about 18,000.

CABBAGE (OF. *cabus* in *chou cabus*, headed cole, OHG. *Kabuz*, Ger. *Kappus*, *Kappes*, from Lat. *caput*, head) (*Brassica oleracea*). A plant in general cultivation for culinary purposes and for feeding cattle. It is a native of the rocky shores of Great Britain and other parts of Europe, and in its wild state is generally from a foot to two feet high. It has been cultivated in Europe from time immemorial and has developed into several different forms, such as cabbage, kale (q.v.), kohlrabi (q.v.), cauliflower (q.v.), and Brussels sprouts (q.v.).

The wild cabbage has smooth, sea-green leaves, waved and variously indented; under domestication these have developed into a head, which is the part eaten.

There are two general classes of cabbages—smooth-leaved and wrinkled-leaved. The smooth-leaved cabbages may be either green or red, the head may be conical, oblong, round, or flat, and there are early, medium, and late maturing kinds. Red cabbage is chiefly esteemed for pickling; while green cabbage is the kind most generally grown in the garden and for market. More than 100 varieties are in cultivation in the United States. The wrinkled-leaved or Savoy cabbage is a cabbage of excellent quality, but is little grown, because it is not so productive as the common green kind. Cabbage demands a rich loam soil with plenty of manure. Seed for the early crop is sown in the hotbed. The plants are set in the field, as soon in spring as the frost is out of the ground, in rows three feet apart and two feet distant in the row. For the late crop the seed is sown in beds or in hills in the open in May. The early cabbage will mature in July, while the late crop may not be harvested until freezing weather. Cabbage may be wintered by putting in pits head down and cover-

ing with straw and earth or by storing in a cold, damp cellar. The tree-cabbage or cow-cabbage is a variety cultivated for cattle, especially in the Channel Islands and the north of France, the leaves of which do not close together into compact heads, but which is remarkable for its great height, reaching, when it is in flower, 10 feet or a rich soil.

CABBAGE DISEASES. Cabbage is subject to two parasitic diseases, both of which are often very destructive. The first of these is clubroot, due to a low fungus, *Plasmidiophora brassicae*, which causes peculiar swellings and outgrowths from the roots of the cabbage, often the whole root system being involved. (See CLUBROOT.) The other disease is a brown or black rot caused by attacks of bacteria, *Pseudomonas campestris*. It has been known in the United States for a dozen years, and has become widely distributed. It is known to occur also in the west of Europe, and is a destructive disease, often devastating whole fields. The disease attacks the cabbage at any stage of growth and often dwarfs the heads or makes them one-sided. If severe, no heads are formed, and the whole plant may be killed. Frequently the heads rot and fall off, but this is due to other agencies than the disease itself. Cut stumps of diseased cabbage show brown or black rings, and these may be traced into the head. On the leaves the margins become yellow and the veins black. The disease seems to enter by the leaves and progresses toward the stem. In many cases the leaves fall off, leaving bare stumps. The disease attacks, in addition to cabbage, turnips, cauliflower, kale, and rape. On the turnip it causes an internal brown rot. It seems to gain entrance through the gnawing of insects, slugs, etc. It remains in the soil for some time, just how long is not known, and is spread through manure and rubbish. For remedial measures it is advised to rotate the crop, destroy all cabbage insects, pay strict attention to the seed-bed, and plant on new soil whenever possible.

CABBAGE-BARK. See ANDIRA.

CABBAGE INSECTS. Many insects infest cabbage-plants, the chief of which are as follows:

Cabbage-Aphis.—A plant-louse (*Aphis brassicae*) brownish-black above, light-green below, which infests the leaves of cabbages and turnips in both Europe and America. See APHIDS.
Cabbage-Bug.—A pentatomid bug (*Margantia histrionica*) called the 'harlequin,' on account of its brilliant coloring (black, yellow, and red), which has spread within the last half-century from Central America throughout the United States, and plays havoc with cabbages and similar plants. It hibernates in tufts of grass and weeds, and attacks the young plants; a strong wash of lime-water is recommended as a remedy.

Cabbage-Butterfly.—A name common to several species of white butterflies of the family Pieridæ, whose larvæ, known as cabbage-worms or kale-worms, feed on the leaves of the cabbage and other cruciferous plants. About a dozen species occur in North America, the most destructive of which is *Pieris rapæ*, a European species introduced by way of Canada about 1800, and now spread over nearly all the United States. In the North it is three-brooded, and in the South is probably even more prolific. Its caterpillar has the green color of the cabbage with a lemon-yellow dorsal band; and it not only eats

CABBAGE AND ALLIES

1. TURNIPS (*Brassica campestris*).

2. KALE (*Brassica oleracea*).

3. BLACK MUSTARD (*Brassica nigra*).

4. CABBAGE (*Brassica oleracea* var.).

5. KOHLRABI (*Brassica oleracea* var.).

6. CAULIFLOWER (*Brassica oleracea* var.).

7. BRUSSELS SPROUTS (*Brassica oleracea* var.).

the leaves before heading-time of the plant, but burrows through the heads. Since Paris green and other poisons cannot be used on the cabbage, this is a difficult pest to combat. Pyrethrum and kerosene emulsions are most to be relied upon, and must be applied before the cabbage heads. The pupa is bare, and suspended by means of a caudal attachment and a medium girdle. The butterfly is white and pale yellow, the fore wings tipped with black; the female has two additional dots and the male one. As in all other cases of introduced pests, the cabbage butterfly does not cause as much damage now as when first introduced. Either it has acquired new parasites and other foes which keep down its numbers, or its old ones have been able to overtake it in the new country. *Pieris oleracea* is a native white form, with little or no black markings, of the northern part of the United States and southern Canada; its larvæ may also feed on the cabbage, as well as turnips, radish, cauliflower, mustard, and various other plants of economic value to man. *Pieris protodice*, whose wings are marked with grayish brown, occurs over nearly the whole of the United States; its larvæ, striped with alternate golden and greenish purple bands, may likewise feed on cabbage. There is a very marked sexual dimorphism in this species, the female being much the more darkly marked. *Pieris brassicae* and *Pieris napi* are two other European agricultural pests of this same family, and several very beautiful species occur in South America. Our native forms are diminishing in numbers, since they cannot well compete with the hardy foreign *Pieris rapæ*.

Cabbage-Cutworm.—The destructive larva of a cabbage-moth. **Cabbage-Flea.**—A flea-beetle (q.v.) which attacks this and similar plants, as *Haltica consobrina*; there are many forms. **Cabbage-Fly.**—A small gray fly (*Phorbia brassicae*) whose maggots prey upon the roots of cabbages; it is related to the housefly and is one of a group of garden-pests, such as the turnip-fly, onion-fly, etc. **Cabbage-Moth.**—A noctuid moth (*Mamestra picta*) whose larva is called the zebra caterpillar, being yellowish, marked by three longitudinal bands of black. It feeds on cabbage and turnip leaves and also on the cranberry. The change to the brown pupa is made in the ground in the autumn. The chestnut-brown fore wings of the moth are mottled with dark brown and white; the hind wings are pale yellow. The chrysalids should be destroyed whenever dug up with the soil, and the caterpillars should be removed from the plant and destroyed. Grooves in the soil, encircling the plants and filled with tar, gas-lime, or quicklime, are said to be a protective. **Cabbage-Worm.**—Any caterpillar injurious to cabbage; specifically that of the cabbage-butterfly.

CABBAGE-PALM, or CABBAGE-TREE.

A name given in different countries to different species of palm, the large terminal bud of which is eaten like cabbage. The cabbage-palm of the West Indies is *Areca oleracea*, or *Oreodoxa oleracea*. The Southern United States also have their cabbage-palm, or cabbage-tree, otherwise called the palmetto (*Sabal palmetto*). See ARECA; PALMETTO; PALMS.

CABBAGE-TREE. See ANDREA.

CABBALA (Med. Lat., Heb. *qabbalah*, reception, as of traditional doctrine, from *gibbel*,

to receive, accept, admit). The designation of a mystical system of philosophy which arose among the Jews at the beginning of the common era, as a reaction against the sober and austere form assumed by Rabbinical Judaism. It attained a great vogue after the Twelfth Century, spread among Christian scholars in the Fifteenth and Sixteenth centuries, and still prevails among the Jews of eastern Europe, though now dying out. Its adherents claimed that their doctrine rested on a revelation made to Abraham, and, according to others, to Adam through the angel Raziel. The teachings were orally transmitted to the days of Moses, who in turn transmitted them to Joshua. By Joshua they were communicated to the seventy elders, and since that time passed down without interruption through chosen individuals until circumstances arose which rendered it desirable to convey the mystic lore in permanent written form. There are two written sources recognized by the Cabbalists—(1) the *Sefer Jezirah*, 'Book of Creation,' and (2) *Sefer Zohar*, 'Book of Light,' commonly known as the *Zohar*. The former is ascribed to Rabbi Akiba (died A.D. 135); the latter to Simeon ben Jochai, a pupil of Akiba. The *Sefer Jezirah* is couched in a Hebrew similar to that found in the Mishnah, but the work now extant under that name cannot date back earlier than the Eighth Century, and may be considerably later; the *Zohar*, written in a rather obscure Aramaic, belongs to the Twelfth or Thirteenth Century of our era, and was probably composed by Moses de Leon of Spain. The *Sefer Jezirah* consists of a series of monologues ascribed to Abraham, in which the patriarch sets forth how he came to the recognition of the true God, and then establishes in a series of aphorisms the harmony between created things on the one side, the thirty-two ways of wisdom, the ten fundamental numbers, and the twenty-two letters of the Hebrew alphabet on the other, as manifested by the divine will. A *Sefer Jezirah* is referred to in the Babylonian and Jerusalem Talmuds; but while it can hardly be identical with the book now extant under that name, yet our *Sefer Jezirah* represents a point of view which is not far removed from the tendency manifested in certain portions of the Talmud itself to interpret the doctrines of Judaism in a mystical sense. Ezekiel's vision of the heavenly chariot drawn by cherubim (see CHERUB), and the mysteries of creation as described in Genesis, furnished the points of departure for mystical speculations regarding the divine nature. The dangers involved in such speculations were recognized by the rabbis, and yet we find the best of them prone to indulge in them. The significance attached in the *Sefer Jezirah* to the letters of the alphabet is paralleled by the principle of Gematria (the term for the numerical sum of the letters comprising a word), which is recognized in the Talmud as an exegetical principle. The *Sefer Jezirah*, however, passes far beyond the current of mystic thought to be detected in the Talmud. It endeavors to explain all things as an emanation of the one Being, and that nothing exists but this Being and its manifestations. Passing still further, it endeavors to show the evolution of one Being itself, which, becoming conscious of itself, is transformed from a virtual

into an actual Being, capable of manifesting itself. The manifestations of its Being are of two kinds—as thought and as word. As thought it is the general intelligence; as word it includes the general as well as the specific ideas, distinguished from one another and expressed by combinations of the letters of the alphabet. The teachings of the *Sefer Jezirah* may be summed up as follows: (1) There are four fundamental principles, one always the emanation of the other. (a) The first is the breath of the living God, without beginning or end; (b) breath of breaths, a condensation of the primeval breath; (c) primeval waters, an emanation of the breath of breaths; (d) primeval fire, arising from the primeval waters. (2) Everything in the universe forms an external circle. Primeval elements are combined and again dissolved. (3) In all manifestations the law of contraries prevails. These doctrines are more fully developed, considerably amplified, and set forth in great detail, in the *Zohar*, which has been properly designated as the Bible of the Cabbalists. The name is based on *Dan. xii. 3*, with which verse the book begins. The *Zohar* is in the form of a homiletical commentary on the fifty-four divisions into which the Pentateuch is, according to Jewish tradition, divided. The Old Testament characters and events are not interpreted in a literal sense, but everything is viewed as symbolical. Mystical thoughts are woven into the sacred name of God, each letter being specially taken up, and even the vowels and accents do not escape this process of interpretation. There are various older books than the *Zohar* in which the Cabbalistic doctrines are set forth, and numerous later ones; but there is none which enjoys such authority among Cabbalists.

In its developed form, and on the basis of the various works which, besides the *Sefer Jezirah* and the *Zohar*, may be regarded as authoritative sources, the religious philosophy of the Cabbala may be summarized as follows:

(1) In regard to God, the Cabbala teaches that He is the original principle of All Being, without end and without limitations. Hence the common designation of God in Cabbalistic works is *En-Sof*—i.e. without end. He is absolutely perfect and unchangeable. Human wisdom cannot fathom His Being, and hence no definition can be given of Him nor any conception be formed of Him. He is the Secret of Secrets, the First of the First, the Oldest of the Oldest, the Ultimate Principle.

(2) Creation, according to the Cabbala, is a process of emanation. There are ten divine emanations, known as the ten Sephiroth (lit. enumerations). The first four (as above set forth), Breath, Breath of Breaths or Air, Water, Fire, one emanating from the other. Upon these four Sephiroth follow six directions of space—height, depth, east, west, south, and north. Besides being called Sephiroth, they are also designated as tools used by God at creation. Out of air the intelligence in the universe is formed; out of water, the material world; out of fire, the spiritual universe (angels and the divine throne). At this point, however, differences of opinion among Cabbalists and considerable confusion of ideas arise. It is not made clear whether these ten Sephiroth represent real acts of creation or merely emanations

by means of which His essence becomes clear to us; and, again, it is uncertain whether the Sephiroth are independent beings intermediate between God and the material world, or mere manifestations of the Divine Being himself. The ten Sephiroth in the developed Cabbala are nominated: (1) Crown, (2) Wisdom, (3) Intelligence, (4) Love, (5) Justice (also called Might and Fear), (6) Beauty (also called Mercy), (7) Victory, (8) Splendor, (9) Foundation, (10) Kingdom. These ten Sephiroth are variously subdivided as Sephiroth of the world and Sephiroth of construction, or into three groups as metaphysical, spiritual, and physical Sephiroth. The Sephiroth were commonly pictured by the Cabbalists under a human form, and the ten emanations divided among his various organs and limbs. Crown representing the head, Wisdom the brain, and Intelligence the heart; while Love, Justice, and Beauty corresponded to the right arm, left arm, and breast respectively, with Victory, Splendor, and Foundation symbolized by the right and left thigh and the genital organs respectively. 'Kingdom' rests under his feet, while God towers above his head.

(3) There are two classes of Sephiroth: (a) Heavenly or Sephiroth of light; (b) Sephiroth of darkness and wickedness. The Sephiroth of darkness produce the evil demons, at the head of whom stands Samael. Through the demons, the work of creation is constantly threatened with destruction.

(4) The end of the powers of evil can be brought about through the triumph of morality and goodness among men; and that again is dependent upon the supremacy of the spirit of man over his desires. When the mind of man is in full control, the Messiah will appear and restore the world to its original perfect state.

(5) Man himself is a type of a divine heavenly man known as Adam Kadmon. He represents in his person the whole scheme of creation, and is, therefore, a microcosmos. All parts of the human body have, therefore, a symbolical significance.

(6) As a means of penetrating into the divine secrets, writing was revealed, and hence words, letters, vowels, and accents all symbolize certain teachings, the secrets of which are only revealed to those who can penetrate beneath the surface. It is in the combination of letters and endless meanings attached to the numerical value of such combinations that Cabbalistic writers indulge, each one trying to outdo the other in mystical interpretations.

From this rapid survey it is evident that various factors are involved in Cabbalistic teachings. The theory of emanation that lies at the basis is an echo of the Idealistic philosophy of Plato, in combination with Neo-Platonism.

Christian Gnosticism represents a second factor that accounts for some of the mystical aspects of the Cabbala, while in its developed form traces of mystical ideas in Islam may be detected. The influence of Cabbalistic teachings on Judaism was fraught with serious consequences. It led to divisions, and to the formation of new sects, which shut themselves from the influence of culture and were hostile to reasoning that did not conform to Cabbalistic teaching; and when the Cabbala spread to the Christian world, its influ-

ence, though not so extensive, was most baneful, and checked for a time the progress of rational philosophic thought.

CABEZA DE VACA, *kā-bā'thā dā vā'kā*. See **CABEZA DE VACA**, NUÑEZ.

CABEIRI, or **CABIRI** (Lat., Gk. *Kάβειροι*, *Kabeiroi*). Divinities worshiped anciently in many parts of the Greek world—in Lemnos, Imbros, Samothrace, and at certain points on the adjacent coasts of Europe and Asia Minor, as well as in a few other places, as at Thebes in Boeotia. The myth of the Cabeiri is obscure, and variously given by different authors. In Lemnos they were represented as sons of Hephaestus, whose ministers they were and whom they assisted at his labors. Being by nature beneficent, they gave the Argonauts a kind welcome when the latter touched at the island. In Samothrace they were honored as the protectors of sailors in time of peril. These Grecian Cabeiri, two, three, or four in number, are said to have been worshiped by the early Pelasgian inhabitants of the Grecian islands, and are to be distinguished from another group of eight (called *Kabirim*), which were of Phœnician origin. Among the later Greeks and the Romans the tendency was to identify the two sets, the process of identification being assisted by the meaning of the word *Kabirim* (the strong, the powerful, the Greek Cabeiri being also called *Θεοὶ μεγάλοι, δυνατοί, ισχυροί*).

(Berlin, 1894); Welcker, *Griechische Götterlehre*, I., III. (Göttingen, 1857-62); Lenormant, in Daremberg and Saglio, *Dictionnaire des antiquités*, I. (Paris, 1892).

CABELL, JAMES LAURENCE (1813-89). An American physician. He was born in Nelson County, Va.; graduated at the University of Pennsylvania; studied medicine there, in Baltimore, Philadelphia, and Paris; and became pro-

fessor of anatomy and surgery in the University of Virginia. He had charge of the Confederate military hospitals during the Civil War, and subsequently was chairman of the National Sanitary Conference and president of the National Board of Health. He published *The Testimony of Modern Science to the Unity of Mankind* (1858).

CABER, *Tossing the* (Gael. *cabar*, pole). An athletic exercise or feat practiced wherever there are Scottish athletic contests. A beam heavier at one end than the other is held perpendicularly against the chest, small end downward, and tossed so as to fall on the heavy end and turn over, the farthest toss and straightest fall winning. Competitions where the powers of the opponents are unknown are generally started with a caber of 24 or 25 feet, from which the thick end is sawn off by degrees, until the proper length is reached. The usual size is 16 feet long, with ends of 5 and 11 inches diameter respectively.

CABES, *kā'bēs*, or **GABES** (anciently, *Ta-cape*). An important seaport and capital of the Tunisian Province of Arad, situated on the Gulf of Cabes, on the eastern coast of Tunis (Map: Africa, F 1). The harbor is too shallow for larger vessels, but the trade of the port is nevertheless of considerable importance. The place, which practically consists of several villages, contains an Arabic school and a French garrison, and is the seat of the Governor of the province. The population was 12,600 in 1896.

CABES, or **GABES**, *Gulf of*. An open gulf of the Mediterranean, on the east coast of Tunis. Its mouth, about 75 miles across, is partly blocked on the extreme south by Jerba Island (Map: Africa, F 1). The town of Cabes is at the head of the bay.

CABESTAING, *kā'bēs-tān'*, **CABESTANH**, or **CABESTAN**, *Guillaume de*. A Provençal poet belonging to the later half of the Twelfth Century. Some of his verses have been published in the collection of Raynouard. Consult the study by Hüffer (Berlin, 1869).

CABET, *kā'bā'*, *Etienne* (1788-1856). A French Communist, born January 1, 1788, at Dijon. Cabet was a true product of the intellectual and social reconstructionists of the era of the Revolution. He was educated as a lawyer, became an efficient Government official as Procureur-Général in Corsica, representing the Government of Louis Philippe, after having headed an insurrectionary committee and participated actively in the July Revolution of 1830. In 1831 he took his seat with the extreme Radicals in the Chamber of Deputies as representative from Côte d'Or. His Radicalism and his revolutionary denunciations aroused the active opposition of the Government, which gave him the choice between two years' imprisonment and five years of exile. He chose the latter, and lived in England studying and thinking out his social philosophy, and finally accepting communism as the only solution of the problems presented by excessive wealth and excessive poverty side by side in modern society. He returned to France in 1839, and published *Voyage en Icarie*, a popular romance, setting forth his new communistic ideas, which won followers by the thousands and drove its author to take steps to realize his Utopia. In 1841 he revived the *Populaire* (orig-

inally founded by him in 1833), which was widely read by French workingmen, and from 1843 to 1847 he printed an Icarian almanac, a number of controversial pamphlets, a book on Christianity (*Le vrai christianisme suivant Jésus Christ*), which makes out Christ's mission to be to establish social equality, and contrasts primitive Christianity with modern ecclesiasticism to the disparagement of the latter, and a popular history of the French Revolutions from 1789 to 1830, in five volumes. In 1847 there were probably 400,000 adherents of the Icarian school, and Cabet turned his attention to a project for a real Icarian colony in America. Influenced by Owen he took a large tract of land in Texas, and sixty-nine men entered into a social contract, making Cabet the director-in-chief for the first ten years, and embarked from Havre, February 3, 1848, to take up land on the Red River in Texas. Cabet came later at the head of a second and smaller band. Texas did not prove to be the Utopia looked for, and, ravaged by disease, about one-third of the colonists returned to France, while the remainder went to Nauvoo in Hancock County, Ill., on a beautiful bend of the Mississippi River, where the Mormons had made a prosperous town before public opinion had driven them to Utah. The new community at Nauvoo prospered, but the location was regarded only as a temporary abiding-place, and Government land was acquired as early as 1852 in southwestern Iowa with a view to removing the community thither, which removal was finally accomplished in 1860 after a split in the community at Nauvoo, part going to Cheltenham, near Saint Louis. Cabet died suddenly of apoplexy in Saint Louis, November 8, 1856, a broken-hearted and disappointed man. He was the inspirer of modern communism at its best, and a writer of more literary merit and moral worth than the calumny which contemporaneous writers in France succeeded in weaving about his name would lead us to believe.

The failure of the Cheltenham colony, to which faction Cabet belonged, and which therefore was recognized in France as the true Icaria, came quickly, and the subsequent history of the Icarian community in Adams County, Iowa, was a record of struggle with debt until 1863, when war prices gave their agricultural products exceptional values. This temporary relief was followed by years of privation, declining numbers, and vanishing hopes. Another split occurred in 1879 between the younger and older members of the community, resulting in a division of the property, the younger element retaining the title and old habitat, while the 'party of the elders' accepted, with a bonus of \$1500, the eastern division of the land, and organized a 'New Icarian Community' about one mile distant from the original village. Consult Shaw, *Icaria: A Study in Communistic History* (New York, 1884). See COMMUNISM.

CABINDA, ká-bên'dá, or KABINDA. A seaport town of Portuguese West Africa, situated in latitude 5° 30' S., and longitude 12° 10' E., north of the estuary of the Congo (Map: Africa, B 4). Since the introduction of a high tariff in Congo Free State, Cabinda has increased its commerce considerably. The name Cabinda is also applied to the entire portion of Portuguese West Africa situated north of the Congo.

CABINET (Fr. dim. of *cabane*, *cabine*, *cabín*, from Gael. and Irish *caban*, booth, hut, tent). Originally a small chamber set apart for some special purpose, such as private interviews, study, or for collections of objects of art or curiosity. Sovereigns, ministers, and other high officials always had such cabinets in connection with larger reception-rooms. The term came to be applied to the closets or show-cases in which the collections were kept in many rooms; and even to the collections themselves. Cabinet collections are always supposed to be of small objects, and in this sense we speak of a cabinet picture. Cabinet-work is, by extension, the art of fine woodwork such as was used at one time largely in making the delicate decorative furniture for such rooms and collections.

CABINET (originally the closet or private apartment of a monarch, in which he consults with his most trusted advisers; hence, sometimes as a term of contempt, those who frequent the king's closet. See CABINET above). The collective body of official advisers of the executive head of the State. In modern times the term is usually limited to the ministers, or heads of the great departments of State, in a constitutional government, but there is no reason for restricting it to such heads of departments, or in refusing the title to the chosen advisers of an absolute monarch. The powers and functions of cabinets vary greatly, even in modern constitutional States.

In England the Cabinet is virtually a committee of the House of Commons, and it constitutes the supreme executive authority of the realm. In the United States the term is applied to the group of executive heads of the Federal Government, who have no authority outside of their several departments, and whose functions as Cabinet ministers is purely an advisory one. The Cabinets of the two countries are alike in this respect, however, that they are composed exclusively of the members of the dominant political party—a result insured in England by the fact that the Cabinet, being a committee of the legislature, is dependent on a parliamentary majority for its continuance in office, and in the United States by the assumed obligation of the President to appoint only members of his own political party to the chief offices of the State. In the constitutional governments of the Continent of Europe and in Japan, as well as in the self-governing British colonies, the model of the English Cabinet has usually been followed. There being in those countries, with the exception of France and Switzerland, no opportunity for the popular will to express itself directly in the choice of the chief executive, popular government is conceived of as signifying parliamentary government, and the attempt is made, with varying degrees of success, to secure to the legislature a substantial measure of executive power through a responsible Cabinet, subject to its control. It is only in Great Britain that this transfer of executive power from the titular head of the State to the legislature has become complete, and that we find *Cabinet Government* in its most highly developed form. In France, however, it is practiced with a large measure of success, and is completely accepted in theory, whereas, in most of the Continental States which have adopted the device of the parliamentary Cabinet, it is still imperfectly accepted and applied.

France is the only important instance of the adoption of Cabinet government by a republic. In the free States, in which the popular will finds expression in the choice of the head of the State, it has not usually been deemed necessary to deprive that head of his executive authority, nor to set up a competing executive, deriving its authority less directly from the people. Hence in Switzerland and the republic of the Western World, the American model—a Cabinet responsible not to the legislature, but to the President or Governor—has been adopted. In this system the Cabinet, as a body, has no official existence, the persons composing it being individually, and not collectively, responsible to the head of the State, and usually holding their offices as well as their advisory relation to him subject to his will. In the Federal Government of the United States this relation is clearly indicated in the phrase 'the President's Cabinet,' by which his official advisors are commonly referred to. Accordingly, the dismissal of a Cabinet minister, or even of the whole Cabinet, may be effected without altering the political complexion or the policy of the administration; whereas, under the English system, the Cabinet is 'the Government,' its members stand or fall together, and its dismissal involves, in the full sense of the phrase, a change of government.

The advantages and disadvantages of these two contrasting forms of popular government are elsewhere set forth (see GOVERNMENT; PARLIAMENT), but the fact should here be noticed that a Cabinet representing the legislature and responsible to it is necessarily deeply concerned in the legislative as well as in the executive business of the State. The British Ministry, representing the dominant political party in Parliament, has assumed complete control of legislation; and this, it is conceived, must always be the tendency of an executive so constituted and so related to the legislative body. Whereas a Cabinet of the American type (even when made up, as it usually is, of party leaders), having no official relation to the legislative branch of the Government, is strictly confined to its foreign executive functions. In some of the foreign States which have adopted the American form of executive, the members of the Cabinet have a place—for purposes of discussion if not of voting—in the legislature; but in the United States the fear of impairing the mutual independence of the legislative and the executive departments of the Government has caused a similar tendency to be successfully resisted.

The President's Cabinet.—The Constitution of the United States made no provision for the creation of executive departments, but vested the sole executive power in the President. The several executive departments through which the President exercises this power have been created by successive acts of Congress, under the authority conferred by Art. I., Sec. 8, par. 18, of the Constitution, authorizing the Congress "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof." At the first session of Congress, in 1789, the departments of State (first called Foreign Affairs), of the Treasury, and of War (which included naval as well as military affairs) were established; and the

heads of these departments (called Secretaries of State, War, and the Treasury, respectively), together with the Attorney-General, who was then a part of the judicial establishment, constituted the first President's Cabinet. The office of Postmaster-General, created upon the organization of the post-office system in 1794, was not deemed of sufficient importance and dignity to entitle its incumbent to a seat in the President's councils, and it was not until 1829 that, by the action of President Jackson, the Postmaster-Generalship became a Cabinet office. In the meantime the Navy Department had been set apart from that of war, and the Secretary of the Navy created a Cabinet officer, in 1798. In the same way, fifty-one years later, the Department of Internal Affairs was set apart from the Department of State, and the office of Secretary of the Interior created and as recently as 1889 the Department of Agriculture was established, and its head, the Secretary of Agriculture, added to the list of Cabinet officers.

It is obvious that there is no natural order of precedence among the chiefs of the great executive departments of the Government, and prior to 1886 there was no legal discrimination between them. But in that year the succession of the members of the Cabinet to the Presidential office, in the event of the death or disability of both the President and Vice-President, was established by act of Congress, in the order in which they are named above. Even under this statute, however, there is no justification for the journalistic practice of referring to the Secretary of State as the 'premier' of the administration, there being no analogy between his position and that of the Prime Minister in a Cabinet of the English model. The President's Cabinet, therefore, consists of his officers of administration, whom he calls into consultation when he desires their advice. They hold their meetings in a room in his official residence, no record is kept of their proceedings, and he is not bound to heed their advice.

The British Cabinet.—There is a curious lack of correspondence between the legal and actual functions of the Cabinet in the Government of Great Britain. Legally it is merely a committee of the Privy Council, originally chosen by the King for advice "in his most secret affairs." Actually it is, as has been said, the executive committee of the House of Commons, entirely independent of the Crown and of the Privy Council, and wielding the supreme authority of Parliament in the administration of the State. It has had a long and varied history. Prior to 1782 it contained honorary or 'non-efficient,' as well as active and 'efficient' members. Since that date it has been made up exclusively "of the persons whose responsible situations in office require their being members of it." The number of these may vary somewhat, but modern usage has fixed the number at not less than eleven. These are usually the First Lord of the Treasury, the Lord Chancellor, the Lord President of the (Privy) Council, the Lord Privy Seal, the Chancellor of the Exchequer, the First Lord of the Admiralty, and the five principal secretaries of State, viz. for Home Affairs, for Foreign Affairs, for the Colonies, for India, and for War. To these may be added the Chief Secretary for Ireland, the Chancellor of the Duchy of Lancaster, the Postmaster-General, the President of the Board of

Trade, and one or two other high officials, but the tendency at present is to limit the number to the principal officers of State above enumerated. All of these officers of the Government are appointed on the recommendation of the Prime Minister, who makes up his Cabinet from among them, and who may or may not hold one or more of those offices himself. He presides at meetings of the Cabinet, but his preëminence gives him no legal control over that body or over its individual members. Its deliberations are secret, and it always acts as a unit, the defection of a member involving his retirement from the Cabinet and from the office held by him. All of its members are also members of one or the other of the Houses of Parliament and take part in the proceedings of that House.

The term 'Cabinet' is sometimes applied, by courtesy, in the United States, to the principal officials of a State Government, who may be called together by the Governor to advise him on questions of policy, and sometimes, in the same sense, the chief executive officers of a municipal government are called a 'Mayor's Cabinet.'

The literature of the subject is very extensive and will be found more fully referred to under the general heads of GOVERNMENT and PARLIAMENT. The historical evolution of the British Cabinet and its relation to Parliament and the Crown are fully set forth in Anson, *The Law and Custom of the Constitution* (Oxford, 1892); and in Todd, *On Parliamentary Government in England* (2d ed., London, 1887). Interesting comparisons of the British and American systems of cabinet government are to be found in Bagehot, *The English Constitution* (London and Boston, 1873), and Bryce, *The American Commonwealth* (3d ed., London and New York, 1900).

CABIRI. See CIBEIRI.

CABLE (OF., Low Lat. *capulum*, *caplum*, a strong [holding] rope, from Lat. *capere*, to take, hold). A strong chain or rope used to hold a ship to her anchor. Practically all cables are now made of chain, only very small craft using rope. See ANCHOR, and CHAIN.

CABLE, ATLANTIC. See ATLANTIC TELEGRAPH, and SUBMARINE TELEGRAPH.

CABLE, ELECTRIC. Strictly speaking, a combination of two or more separately insulated electric conductors with a protective covering or armor. Popular usage sanctions the extension of the term electric cable to simple insulated and armored wires and to ropes of twisted wires without either insulation or armor. Retaining for the present the limited definition first given, an electric cable may be described as consisting structurally of, first, the conducting wires or core; second, the insulating material separating the several wires; and third, the protective covering or armor. Cables may be aerial, submarine, or underground, depending on their position; classed according to their uses they are telegraph, telephone, electric-light, and power cables, and as to the arrangement of their conductors they are straightway or twisted. Cables for different purposes differ somewhat in the details of their construction, but their general construction is substantially similar, and the following description of underground cables for electric lighting will answer for cables for other purposes, with such exceptions as will be noted farther on. Electric-light cables for use

underground are of two classes, according as the insulation is or is not moisture-proof. In the first class the insulation is rubber bitumen and the lead covering is for protection from mechanical injuries only. The second class is insulated with jute, hemp, or paper impregnated with wax, or resinous compound, and the lead covering for this cable is absolutely necessary on account of the hygroscopic nature of the insulation. The manufacture of a cable of the first class may be described briefly as follows: To insulate the conductor it is first wrapped round with one or more layers of pure rubber tape laid on spirally, the direction of the spiral being reversed for each successive layer. On top of this rubber compound is applied in two or more separate coatings, each coat being put on by pressing the partially formed cable with two strips of rubber compound, one above and one below it, between a pair of rollers which fold each strip half around the cable and press the edges of the two strips together so as to make a good joint along each side. When a sufficient number of layers of rubber compound have been

AN UNDERGROUND CABLE FOR ELECTRIC LIGHTING.

put on to give the requisite thickness, the core is tightly bound in a spiral wrapping of prepared rubber tape and then vulcanized. After this the cable is tested to determine the efficiency of its insulation. If this test is satisfactory the cable is taken to the taping and braiding machine where the external covering of tapes and braiding is put on. The next step is to armor the cable with lead. This may be done by drawing the cable into a lead tube, which is then drawn through a die and made to fit the core tightly; or the last cover may be put on in a hydraulic press, the hot lead being forced out through an annular die around the cable. The accompanying sketch shows the make-up of an electric-light underground cable before it is armored. Of cables of the second class the Siemens cable and the paper cable are representative examples. In the Siemens cable the conductor is wrapped with jute and impregnated with a special bituminous compound mixed with heavy oil, and is then covered with lead. Paper cable consists of paper wound on in strips spirally over the conductor, and as each strip is applied the whole is passed through a die which presses it into a compact mass. The core is then dried at a temperature of 250° F., to expel the moisture from the paper, and immersed in a bath of specially prepared compound, from which it passes directly to the lead covering press.

The standard type of cable for telephone work consists of 400 insulated wires twisted in pairs with about three-inch lay; and the pairs are cabled in reverse layers, forming a cable about two inches in diameter. The 200-pair cable is used for main routes, but 100-pair, 50-pair, and smaller cables are used for distribution. The insulation consists of dry paper wound loosely on the wire, and the whole is armored with lead.

pipe. Submarine cables for telegraph and telephone lines are much like the underground cables of the first class for electric lighting, but are commonly armored with strands of iron wire. (See *SUBMARINE TELEGRAPH*.) Aërial cables for long-distance power transmission are commonly neither insulated nor armored. For example, the aluminium cable for the 181-mile transmission line of the Bay Counties Power Company, in California, is seven-eighths of an inch in outside diameter and consists of 37 aluminium wires twisted into a rope without insulation or armor. These cables carry a current of 40,000 volts. Aërial cables for local distribution are usually insulated. This insulation is usually in two parts: one of insulating material impervious to moisture placed next to the wire, and the other of some substance which resists abrasion or other mechanical injury. In the most expensive grades of wire more than two coatings are employed. Various special cables are employed. For example, there is in use in New York City a three-conductor cable for transmitting three-phase lighting current from the main stations to substations. This cable may be broadly described as consisting of three separate insulated cables of 37 wires, twisted together with the spaces filled with jute and the whole first insulated and then armored with lead pipe. Concentric cables are another special form. They consist first of one wire core of twisted wires, second a thick layer of insulation, third a layer of spirally wound wire or wire strands, fourth a layer of insulation, and fifth a protective coating or armor. See *SUBMARINE TELEGRAPH*. Consult the sections relating to electric cable construction to be found in Crocker, *Electric Lighting*, Vol. II. (New York, 1901); Foster, *Electrical Engineer's Pocket-Book* (New York, 1901); Houston, *A Dictionary of Electrical Words, Terms, and Phrases* (New York, 1894).

CABLE, GEORGE WASHINGTON (1844—). An American novelist and writer on social questions. He was born in New Orleans, October 12, 1844. On his father's side he is of Virginia stock, and on his mother's side of New England ancestry. After scant schooling, Cable became a clerk in New Orleans, and in 1863 entered the Confederate Army, where he served in the Fourth Mississippi Cavalry. At the close of the war he became a civil engineer, but malarial fever drove him back to mercantile life and he was employed as accountant in a firm of cotton factors till 1879. During this period he wrote for the New Orleans *Picayune*, under the pseudonym of Drop Shot, and it was at this date that he published his first volume of fiction, *Old Creole Days*, a collection of short stories dealing with the then unexploited types of social life in New Orleans and Louisiana. This was followed by *The Grandissimes* (1880), which is probably his best work; *Madame Delphine* (1881); *Dr. Serier* (1883); *Bonaventure* (1888); *Strange, True Stories of Louisiana* (1889); and, less valuable and interesting, *John March, Southerner* (1894). These constitute an original and unique body of fiction. His most recent novels are *The Cavalier* (1901), and *Bylow Hill* (1902). Cable is less popularly known in his more expository books, *The Creoles of Louisiana* (1884), *The Silent South* (1885), and *The Negro Question* (1890). In 1885 Cable removed to New England, living first at Simsbury, Conn., and later at

Northampton, Mass. (1886). The value of Cable's best work is recognized by all students and critics of American literature, and appreciations of his work are to be found in contemporary reviews.

CABLE MOLDING. In architecture, a molding cut in the form of a rope, the twisting being prominently shown. It was much used in later Norman work.

CABLEWAY. A hoisting and conveying device, employing a suspended cable as a trackway, and differing from ropeways (q.v.), which cannot be used for hoisting, being limited to the sole function of conveying. While ropeways date back to the early part of the Nineteenth Century, the cableway had its origin practically in an inclined hoisting and conveying device invented about 1860, and still extensively used in the slate-quarries of Vermont and Pennsylvania. These first cableways consisted of a winding-engine with one drum, a suspended cable, a cable-carriage traveling on the suspended cable, a fall block adapted to rise and fall from the cable-carriage, and a hoisting-rope operating the same. The suspended cable or track cable of these cableways ran on an incline from the top of a trestle tower to a ground anchor. Horizontal cableways of short span were used in the construction of the piers of the Saint Louis Bridge. As the span of cableways became greater the necessity arose of supporting the hoisting-rope or fall rope between the tower and the carriage. The devices for supporting the fall-rope are termed fall-rope carriers. One of the earliest arrangements of this sort consisted of a series of blocks, at the upper end of each of which was a sheave riding on the track cable and through the lower end of which was a hole for the fall rope. These blocks were connected by a light chain, one end of which was also connected to the head tower and the other end to the carriage; as the carriage moved out from the head tower it strung the blocks at intervals along the track cable, and as the fall rope passed through a hole in each block it was supported and prevented from sagging unduly; as the carriage returned to the tower it gathered up the blocks into a bunch at the tower. This system of fall-rope carriers was objectionable chiefly because of the weight of the connecting chain, and although it is still used in its essential features, the heavy chains have been replaced by light steel wire connections and other important reductions made in the weight.

A second form of fall-rope carrier arrangement much used may be described as follows: An auxiliary rope is suspended above the main cable and held in a parallel position to the main cable by passing under wheels in the cable-carriage. On this rope a series of buttons are secured whose diameter increases with the distance from the head tower; slots in the heads of the carriers, corresponding to the diameter of the buttons, allow each of the carriers in passing out from the head tower to be stopped at its proper button. The carriage distributes and picks up the carriers in its forward and return journeys.

Described briefly, the modern cableway consists of a heavy steel cable called a track cable or main cable, suspended with a slight sag between the tops of two timber towers so placed that the main cable spans the quarry, canal, foundation pit, or other work on which it is to be used. On this

main cable a carriage runs, being drawn back and forth by an endless rope passing around suitable sheaves at the tower-tops and operated by a special hoisting-engine mounted at the bottom of one of the towers. From the same engine a hoisting or fall rope passes to the top of the engine tower and thence through the fall-rope carriers to the carriage, where it connects with a fall block by means of which the load is hoisted. The fall-rope carriers have already been described. The operation of the cableway is as follows: The carriage is run out on the main cable to a point directly over the place from which the load is to be picked up; the fall block is then lowered by running out the fall rope, and when it reaches the ground the load is attached; the fall rope is then hauled in, raising the load high enough to clear obstructions, and, finally, the carriage is hauled to the point of the main cable directly over the place where the load is to be deposited, and the fall rope then runs out, lowering the load to the ground. In work such as canal excavation, for example, where the purpose is simply to hoist the load of earth or rock, convey it to the bank, and deposit it as quickly as possible, the discharge of the load is effected in mid-air by special mechanism. In other cases the towers carrying the cables are mounted on wheels so that the whole cableway plant may be moved easily from one position to another.

The traveling cableway is particularly adapted to canal work, where the towers are placed on opposite banks, with the cables spanning the channel, and are moved along the banks as the excavation progresses. Cableways are built of varying capacities and lengths of span, depending in each case upon the work which they are required to perform. They are sometimes, though seldom, used for passenger traffic. Mr. Spencer Miller, the inventor of the Miller cableway, places the following limitations on the practical applications of cableways: Span (single), 2000 feet; load, 25 tons; speed of travel, 1800 feet per minute; and speed of hoist, 900 feet per minute. The average practice, however, is about as follows: Span, 600 to 1200 feet; loads, 3 to 7 tons; speed of travel, 500 to 1000 feet per minute; speed of hoist, 150 to 300 feet per minute. The files of the engineering journals and the excellent printed matter prepared by manufacturers of cableways should be consulted for further information on this subject.

CABLING. The cylindrical molding by which the hollows in the flutes of columns and pilasters are sometimes partially filled, though seldom beyond the third part of the height from the ground.

CABOCHED, *kā-bōshē*, or **CABOSHED** (OF. *caboche*, It. *capocchia*, knob, from *capo*, Lat. *caput*, head). An heraldic term, denoting the head of an animal, borne without any part of the neck, and exhibited full face.

CABOCHIENS, *kā-bō'shyān'*. A political faction in Paris, in the reign of Charles VII., named from one of the leaders, Simon Caboche. It comprised a large number of members of the butchers' trade, and was organized in the years 1411-13, to obtain reforms from the royal Government, and to aid the party of Burgundy against the Armagnacs. Many Government officials sympathized with the Cabochiens. They became quite powerful by the year 1413, organizing the Paris mi-

litia, exercising a general supervision of trade, and by a series of riots in the same year forcing Charles VII. to recognize their demands by letters patent. As a result, the Cabochiens reformed the whole royal administration; but a reaction occurred, the Armagnacs gained the upper hand, the Duke of Burgundy fled from Paris, and the fortunes of the Cabochiens waned. In 1417 the guild of butchers was abolished and their privileges annulled.

CABOOL, *kā-bōōl'*. See **KABUL**.

CABOT, *kāb'ot*, **GEORGE** (1751-1823). An American politician. He was born in Salem, Mass.; studied for two years at Harvard College, and then went to sea and became a captain before reaching his majority. He was chosen to the Massachusetts Provincial Congress in 1773; was also a member of the State Constitutional Convention, and was United States Senator from 1791 to 1796. When the office of Secretary of the Navy was created, in 1798, he was appointed to it by President Adams, but he declined to serve, though he actually held the office for a month and thus became the first head of the Navy Department. In 1814 he was elected president of the famous Hartford Convention (q.v.). Consult Henry Cabot Lodge, *Life and Letters of George Cabot* (Boston, 1877).

CABOT, **JOHN** (1450-98). An Italian navigator sailing under the English flag. His native name was Giovanni Caboto, and he was born in Genoa. He removed to Venice at an early age, acquired citizenship there, and traded thence to all the important Mediterranean ports. About 1490 he removed to England, and settled in Bristol. If, as has been stated without any convincing historical authority, he was engaged by King Henry VII. to settle certain difficulties between the Danish Government and the English merchant-factors resident in that country, he must have acquired a position of some consequence. On March 5, 1496, he secured from King Henry VII. letters patent authorizing him to take possession of any lands he might discover. He sailed in May, 1497, and on June 24, after a rough passage, landed on the North American coast, probably near Cape Breton. He returned to England, where he landed on August 10, and was rewarded by the King with the post of Great Admiral. He began immediately to prepare for a second voyage, with the purpose of exploring and colonizing the new-found land. Several Bristol merchants cooperated to fit out a fleet, equipped with everything needed for the complete exploitation of a new country. Cabot set sail with five vessels in the spring of 1498. One of the ships put back and landed on the Irish coast, whence the crew returned to England with the news that the fleet had run into a severe storm, which had forced them to make for land. No further news was ever received of the fate of the discoverer or of his expedition. A number of early narratives, which are sometimes said to refer to this 1498 voyage, and speak of Cabot as sailing along the whole North American coast, from Florida to Newfoundland, probably describe a voyage made by Sebastian Cabot.

CABOT, **SEBASTIAN** (1475-1557). An English navigator, born in Venice. He was one of the three sons of John Cabot, his brothers being Lewis and Sanctus. There is no contemporary

evidence that Sebastian accompanied his father on either of the two voyages to America, in 1497 or 1498. After his father's death, Sebastian took up the profession of navigation. He was also a cartographer of some repute, being employed to prepare the maps for an English military expedition to southwestern France (1512). He accompanied the English forces, and while away was induced to enter the service of the King of Spain. He soon rose to an influential position as the head of the Spanish navigation office, with the title of pilot-major, a post he held for 30 years. There is some evidence, however, that in 1517 or 1518 he led an English expedition in search of a northwest passage to Cathay. In 1528 Charles V. gave him the command of an expedition which was intended by its promoters to pass through the Strait of Magellan and trade in the Spice Islands. Acting probably under secret orders from the King, Cabot entered the estuary of the river which he afterwards named La Plata, in the hope of finding another passage through to the Pacific. Misled by the stories which he had heard from the Indians, who told him that silver and gold (really to be found in Peru) were to be had at the headwaters of this river, he spent three years in trying to reach these sources of wealth. As a result the undertaking turned out a ruinous failure, and Cabot, after his return to Spain in 1530, was tried and found legally culpable for the disaster. The King, however, pardoned him and restored him to his office as pilot-major. In 1548 Cabot went back to England, and accepted a pension from the Government of Edward VI. for his services as Great Pilot. He became governor of the company of Merchant Adventurers, and was a prime mover in organizing and equipping the expedition of Willoughby and Chancellor to Asia by the northeast sea route, in 1553, and that of Stephen Burrough by the same route in 1556. He died in the winter of 1557-58. The character of Sebastian Cabot has been variously estimated. English writers, supposing him to have been born in Bristol, eulogize his every trait and action. Consult Nicholls, *Remarkable Life of Sebastian Cabot* (London, 1869). In reaction against this view, consult Henry Harris, *John Cabot and His Son Sebastian* (London, 1896), than whom there is no more learned authority, and who describes him as a renegade and traitor, an unfilial boaster, without a single redeeming quality. The truth is presumably midway between these two extremes. Consult Winship, *Cabot Bibliography* (London, 1900).

CABRA, ká'brá (anciently, *Aegabro*; Sp. *capra*, Lat. *capra*, goat). A town of Spain in the Province of Cordova, situated on the northern slope of the Sierra de Cabra, 47 miles southeast of Cordova (Map: Spain, C 4). It contains an old Moorish mosque, now a church, several monasteries, and a theatre. Population, in 1897, 12,363.

CABRAL, ká-brál', or **CABRERA**, ká-brá'rá, PEDRO ALVAREZ (1460-1526). A Portuguese navigator. His public life, as far as known, was limited to the brief period 1500-01, when he was in charge of a fleet fitted out by King Emmanuel, destined for the East Indies. With 13 vessels and about 1200 men Cabral left Lisbon on March 9, 1500, intending to follow the route previously taken by Vasco da Gama, by way of the Cape of Good Hope. Either to avoid storms or calms, he took a course west of that of Vasco da Gama, and

was carried to the coast of Brazil by the strong southern equatorial current. Pinzon had touched on the northeastern coast of Brazil in the very beginning of the same year, somewhat north of where Cabral landed. Pinzon, however, did not seem to recognize the significance of his discovery, and Cabral regarded the coast as part of the Eastern Hemisphere, the non-Christian portions of which had been assigned to Portugal. He accordingly 'took possession' in the name of the Portuguese King, calling the country *Terra Sanctæ Crucis*. Had Columbus failed in his original enterprise, the New World would not long have remained unknown to Europe, for the Portuguese followed up this accidental discovery of Brazil, and would in this way have opened up the Western Continent. Leaving Brazil, Cabral sailed eastward to India, making important discoveries on the way. He founded a trading post at Calicut, and concluded the first commercial treaty of Portugal in India. On his return to Portugal, he was for some reason not retained in service, and sinks again into obscurity. "This adventure of Cabral's had interesting consequences. It set in motion the train of events which ended, after some years, in placing the name 'America' upon the map." Consult Fiske, *Discovery of America*, Vol. II. (Boston, 1892); Capistrano de Abreu, *Descobrimento do Brasil* (Rio de Janeiro, 1883).

CABRERA, ká-brá'rá (anciently, Lat. *Capraria*, goat island, from *caper*, *capra*, goat). One of the Balearic Islands (q.v.), situated about 10 miles south of Majorca (Map: Spain, G 3). It is about 3 miles in length and breadth, with an irregular coast. Fishing is the chief industry. Its permanent population amounts to only a few hundred. During the war in the Peninsula, Cabrera formed a Spanish depot for French prisoners, who were crowded by thousands into the desolate spot, and treated with great barbarity.

CABRERA BOBADILLA CERDA Y MENDOZA, bó'ná-dé'lyá thá'r-dá é mán-dó'thá, LUIS GERÓNIMO FERNANDEZ DE (c.1590-1647). A Spanish administrator, born in Madrid. From 1629 to 1639 he was Viceroy of Peru. His administration was at the outset rendered difficult by the constant clamor for money on the part of the royal treasury. Spanish cruelty aroused among the Uru Indians of the Lake of Titicaca an insurrection, which in 1632-34 he arduously suppressed. It was during his viceroyalty that discovery was made of the febrifuge properties of cinchona bark, and that the third navigation of the Amazon was accomplished.

CABRERA, RAMON (1810-77). A leader of the Carlist party in Spain, born at Tortosa, in Catalonia. At the outbreak of the civil war, following on the death of Ferdinand VII., in 1833, Cabrera joined the Carlists (q.v.) and soon rose to a high command. Such was his reputation for cruelty that the Government general Mina had Cabrera's mother arrested and shot "to restrain by a just system of reprisals the excesses of the bloodthirsty Cabrera." After penetrating as far south as Andalusia, his forces were completely routed by the royal troops on the borders of Aragon, and he himself, severely wounded, escaped with difficulty. He soon reappeared at the head of 10,000 foot and 1600 horse. Invading the Province of Valencia, he overthrew the royal army at Buñol (February 18,

1837), and again, on March 19, at Burjasot; but was in turn vanquished at Torre Blanca, and once more compelled to seek a hiding-place, but only to reappear soon after. Madrid itself was threatened by Cabrera, who about this time received from Don Carlos the title of Count of Morrell for his vigorous defense of the fortress of that name, and was also appointed Governor-General of Aragon, Valencia, and Murcia. The Carlists now believed that the triumph of absolutism was approaching, when the treachery of the Carlist general Maroto changed the whole aspect of affairs, and Don Carlos fled from Spain. Cabrera held out until, hemmed in by Espartero, he was forced to quit the country, July, 1840. He then entered France, where he was taken prisoner, and confined for a short time in the fortress of Ham. In 1845, when Don Carlos renounced his rights to the throne in favor of his son, Count Montemolin, Cabrera accompanied the latter to England. On the outbreak of the French revolution in 1848, he renewed the struggle on behalf of absolutism in Spain, but the adventure proved a miserable failure, and after the encounter at Pastoral, January 27, 1849, he recrossed the Pyrenees, to live in retirement. He afterwards married an English lady, Miss Marianne Catherine Richards. When Alphonso XII. was proclaimed King of Spain, in 1875, Cabrera advised the Carlists to submit to him, chiefly because he was "a good son of the Church." He died May 24, 1877. Consult: Valras, *Don Carlos VII. et l'Espagne carliste* (Paris, 1876); Arjona, *Pages d'histoire du parti carliste: Charles VII. et Ramon Cabrera*, translated from the Spanish (Paris, 1875); Diaz and Cardenas, *Galería de Españoles célebres contemporáneos*, Vol. I. (Madrid, 1841).

CABRILLA, ká-bré'lyá (Sp.). One of several serranoid fishes, especially a grouper (q.v.) of Floridian and West Indian waters (*Epinephelus capreolus*); also the name of certain small fishes of the coast of Southern California.

CABUL, ká-bōól'. See KABUL.

CACAO, ká-ká'ō or ká'kō, or **COCOA**, kō'kō (Sp., from Mex. *caca uatl*, coca-tree). The different kinds of cacao either consist of, or are prepared from, the seeds of trees of the genus *Theobroma* (Gk., 'food of the gods'), which contains a number of species, trees of moderate size with large, undivided leaves and clustered flowers, all natives of the tropical parts of America. By far the most important species of this genus is *Theobroma cacao*. It should not be confounded with the cocoa-tree, from which we get the cocoanut, or with the shrub *Erythroxylon coca*, from which the alkaloid cocaine is obtained. It is extensively cultivated in tropical America and the West Indies, and its cultivation has been introduced into some parts of Asia and Africa. It requires a deep, rich soil, heat, and moisture, for the most favorable growth. Sheltered valleys, free from hard winds, are desirable, and shade from other tall-growing, spreading trees is necessary. It generally rises with a bare stem 6 or 7 feet, dividing into many branches, and attaining a height of only 18 or 20 feet altogether, although it is sometimes twice that height. The fruit is somewhat like a cucumber in shape, and is 6 or 8 inches long, yellow, and red on the side next the sun; the rind is thick and warty, the pulp sweetish and not unpleasant; the seeds are

numerous, compressed, and not unlike almonds with a thin, pale, reddish-brown, fragile skin or shell, covering a dark-brown, oily, aromatic, bitter kernel, which consists mostly of the wrinkled cotyledons. These seeds are the cacao-beans of commerce. The cacao-tree produces larger seeds in cultivation than in a wild state. The tree bears in four or five years, attains its full vigor and productiveness in twelve years, and generally yields two principal crops in the year. When gathered, the fruit is subjected to four to seven days' fermentation in earthen vessels, or in heaps on the ground, or it is buried for a while in the earth, till the pulp becomes rotten. The latter method is said to produce the best cacao ('earthed cacao,' or *cacao terré*). The fermentation is induced by an unorganized ferment inherent in the pod, and upon the proper handling of the bean during this period largely depends the quality of the product. After fermentation, the beans are hulled and are carefully dried under uniform conditions of heat and moisture. The average yield per tree under favorable conditions will reach 7 pounds annually of cured cacao. Usually, however, the yield is from 2 to 3 pounds per tree, or 400 to 600 pounds per acre.

In manufacturing cacao, the seeds are screened, roasted, and decorticated, the kernel being known as *cocoa-nibs*. The hulls make a cheap substitute known as *miserable*. About two-thirds of the fat is removed and placed on the market in cakes known as cacao butter, and is thus used for emollients, pessaries, etc. The residue of the cacao-nibs is ground, boxed, and sold as 'cocoa,' or is pressed into cakes after being sweetened and is known as 'chocolate.'

Cacao is very nutritious. The principal constituent of cacao-beans is the soft, solid oil which forms more than 50 per cent. of the whole shelled bean, about 22 per cent. being starch, gum, mucilage, etc., and 17 per cent. being gluten and albumen. They contain also a crystallizable principle called theobromine (see THEOBROMINE: CAFFEINE). The following figures show the average of analyses of cocoa and chocolate bought in open market:

	Protein	Fat	Carbohydrates
Cocoa.....	21.6%	28.9%	37.7%
Chocolate.....	12.9	48.7	30.3

Nine-tenths of cocoa is assimilated in the system. For dietetic use, cocoa is prepared in several ways. It is made into chocolate (q.v.): it is eaten in the solid state in the form of cakes and bonbons, or is scraped down and treated with boiling water or milk. When cacao-nibs are infused with water like coffee, they yield a highly palatable beverage, which is much lighter than any other infusion of cacao. The large quantity of oily matter present in the bean tends to make the various infusions thick and heavy, so that they do not agree with some delicate stomachs. The annual consumption of cacao is upward of 100,000,000 pounds. An infusion of the broken and roasted shells of cacao-beans is sometimes used in the same way as tea or coffee. The pulp of the fruit is eaten in the countries in which the tree grows, and a kind of spirit

s obtained from it by fermentation and distillation. For illustration, see BEVERAGE PLANTS.

CACCIANIGA, kă'châ-né'gâ, ANTONIO (1823—). An Italian author, born at Treviso. In 1848 he founded in Milan the satiric periodical *Lo Spirito Folletto*. After the revolution of 1848 he was for six years in exile, living as a journalist in Paris. Subsequently he was elected mayor (podestà) of Treviso and a Parliamentary Deputy. His works include: *Il pro-critta* (1853); *Bozzetti morali ed economici* (1869); *La vita campestre* (new ed., 1870); and *Villa Ortensia* (1876).

CACCINI, kâ-ché'né, GIULIO (c.1558-1618). An Italian musician, born in Rome, and often called Giulio Romano for that reason. He learned to sing and to play the lute under Scipione della Malla, and in 1578 went to Florence, where he spent most of his life. He is said to have been the first to emphasize the importance of musical accompaniment for the voice, and he illustrated the dramatic possibilities of this by accompanying himself on the theorbo while he sang a kind of recitation. The experiments of Caccini, Corsi, Bardi, Galilei, and others may fairly be called the beginnings of modern opera. He was the composer of *Euridice* (1600), a musical setting of the drama by Rinuccini, *Le nuove musiche* (1602), group of songs for a single voice; *Il combattimento d'Appolline col serpente*; and parts of several choruses.

CÁCERES, kâ'thâ-râs (anciently, Lat. *Castra Caecilia*). A town of Spain, capital of the province of Cáceres, in Estremadura, situated on a river of the same name, 25 miles west of Trujillo, in a rich agricultural district (Map: Spain, B 3). It is famous for its bacon; has manufactures of linen, woollens, leather, hats, soap, etc., and controls a large trade in the produce of the district. Population, in 1897, 15,400.

CÁCERES, ANDRÉS AVELINO (1836—). A Peruvian statesman and soldier. He was born at Ayacucho, in southern Peru, November 10, 1836. At an early age he participated in the rising of Castillo, distinguished himself at the taking of Arequipa, and from 1857 to 1860 was military attaché to the Peruvian legation at Paris. He fought in the Chilean War (1879-83), in which he was raised to the rank of general. After the capture of Lima he became the head of the provisional government. In 1884, in trying to dislodge Iglesias, whom the Chileans had set up as President, he was repulsed before Lima, but he gathered a larger force, entered the city in the following year, and induced the President to refer the Presidential question to popular election. The result was favorable to Cáceres, who was chosen President and inaugurated in June, 1886. In 1890 he was succeeded by Bermudez, and went soon afterwards as Peruvian Minister to France and Great Britain. Upon the expiration of Bermudez's term of office, in 1894, the adherents of Cáceres seized the government and forced the Congress to choose him President. The party of Piérola took up arms, Lima was besieged, and on March 18, 1895, the city was taken by assault after a murderous fight. In a treaty of peace concluded between the two factions, Cáceres resigned the Presidency, and soon afterwards fled the country. Piérola was elected President in his stead.

CÁCERES, NUEVA. See NUEVA CÁCERES.

CACHALOT, kâsh'â-lôt. See WHALE.

CACHE, kâsh (Fr., from *cacher*, to hide). The name given by parties of travelers in uninhabited parts of North America to places for concealing provisions and other articles. Designing to return on their tracks, they disburden themselves of what articles can be spared, and, to conceal them from Indians or others, construct places of deposit in the wilderness. A hole is dug to a depth of perhaps 6 or 8 feet and several feet broad, and, the articles being interred, the surface replaced with care and all traces of the excavation obliterated. The situation of the cache is afterwards found by some landmark or other sign. If containing provisions, the cache needs to be made to resist the depredations of animals, hence it is often covered with rocks. Prominently marked caches are built by expeditions in the Arctic regions as supply stations, or for the use of distressed mariners.

CACHEO, kâ-shâ'ô, or **CACHEU**. A fortified town in Portuguese Guinea, West Africa, situated on the river Cacheo, about 10 miles inland (Map: Africa, C 3). It was founded in 1588 and has an estimated population of 15,000, mostly natives. It has some trade in ivory and gold-dust.

CACHEXIA, kâ-kâks'î-â (Neo-Lat., Gk. *καχεξία*, *kachexia*, from *κακός*, *kakos*, bad + *ἔξις*, *hexis*, state). A medical term used to denote a general condition of the body resulting from a wasting disease; a depreciated condition due to disordered nutrition and impoverished blood. The condition is noticeable in the case of persons suffering from malaria, cancer, tuberculosis, gout, kidney disease, etc. In the cachexia of kidney disease, for example, the face is thin, pale, and waxen, the ears semi-translucent, the lips pallid, the lower eyelids baggy and dark, the forehead at times swollen with fluid and pitting on pressure, the expression sad.

CACHOEIRA, kâ-shwâ'é-râ (Portug., waterfall, cataract). A town in Brazil, situated on the Rio Paraguassu, 62 miles northwest of Bahia, with which it is connected by rail (Map: Brazil, K 6). The town manufactures tobacco and cigars, the suburb, Saint Felix, giving its name to the best brand of Brazilian tobacco. It also exports coffee, cotton, and fruits. Population, about 15,000.

CACHOLONG, kâsh'ô-lông (probably *Cach*, a river of Bokhara, where it was originally found + Kalmuck *chalong*, stone). An opaque milk-white, sometimes yellow or red, variety of opal. It has a conchoidal fracture and a pearly lustre, in consequence of which it is sometimes called *pearl opal*, or *mother-of-pearl opal*. It has also been found, associated with chalcedony, in Nova Scotia, on the Bay of Fundy.

CACHUCHA, kâ-chôô'chá (Sp.). An Andalusian dance of much grace. Its origin is unknown. It is written in 3-4 time, and resembles the *bolero* (q.v.). The cachucha is usually danced with castanets. It was introduced on the stage by Fanny Elssler, in the ballet of *Le diable boiteux*.

CACIQUE, kâ'sâk'. A title borne by the native princes or chiefs of Cuba, Haiti, Mexico, and Peru, besides other parts of America, at the time of Spanish discovery and exploration. In more recent times the title has been bestowed upon

the chiefs of independent Indian tribes. Locke adopted this title in his *Fundamental Constitutions of Carolina* (1689). In this revival of feudal society there were to be, according to *The Grand Model*, two county dignitaries who should bear the title cacique, and rank next after the landgrave.

CACIQUE, or **CAS'SICAN** (Sp., from native Haitian). Any of several icterine birds of Central and South America, allied to the Baltimore oriole, and forming the genus *Cassicus*. They are noted for their intricately woven pensile nests, composed of grass or thin bark, in the form of a purse or pouch, sometimes a yard long, and suspended from the extremity of a branch of a tall tree, apparently to insure safety from monkeys and serpents. Several of these nests are often to be seen hanging from the branches of the same tree. (See Plate of **PENSILE NESTS OF BIRDS**.) The name 'cassican' is also given sometimes to the piping crow of Australia and Papua.

CAC'ODYL, or **KAK'ODYLE** (Gk. *κακὸδύς*, *kakôdês*, ill-smelling + *ὄλη*, *hylê*, wood, stuff, matter). An organic substance composed of carbon, hydrogen, and arsenic. It is a highly poisonous liquid, spontaneously taking fire if exposed to the air. Its formula is $As_2(CH_3)_4$. Its oxide, $As_2(CH_3)_4O$, is obtained by distilling a mixture of arsenious oxide and potassium acetate; in the pure state it does not, like cacodyl, take fire on exposure to the air; it readily combines with acids to form salts, such as cacodyl chloride, $As(CH_3)_3CN$; cacodyl cyanide, $As(CH_3)_3CN$, etc. The *cacodyl group*, $As(CH_3)_3$, was the first metallo-organic radical known to chemists. Its discovery by Bunsen, following Wöhler and Liebig's discovery of the benzoyl group, had an important influence on the development of the science of organic chemistry.

CACOMISTLE, *kāk'ô-mis-el* (native Mex.). A small animal (*Basarisca astutus*) of the raccoon family, inhabiting Mexico and adjacent parts of the United States. Its body is about 16 inches long, and its tail about 15. It is rather slender, with a sharp, fox-like face, and large, bright eyes, surrounded by light patches, which, with the erect ears, give an alert and pleasing expression to the countenance. The fur is long, soft, and light brown above, darker along the back, and the long, bushy tail has six or eight broad, white rings; the under parts are white. It has much the same habits as a raccoon, catching small mammals, birds, and insects, and is often tamed and regarded as a most pleasing pet among miners, who usually call it the American civet-cat. Consult *Bulletin Am. Mus. Nat. Hist.* (New York, 1895). See Plate of **MINOR CARNIVORES**.

CACOS, *kā'kôs* (Sp., pl. of *caco*, pickpocket). An epithet applied to the 'Separatist' Party of 1820 in Guatemala. A faction in Haiti has also received the name.

CACOUNA, *kā'kōō-nā*. A picturesque and fashionable watering-place in Temiscouata County, Quebec, Canada (Map: Quebec, G 3). It is situated on the right bank of the Saint Lawrence River, 114 miles from Quebec. It contains numerous summer cottages of wealthy Canadians, has good hotels and boarding-houses, while a

smooth, sandy beach affords admirable bathing facilities. It is also resorted to for trout-fishing and hunting. A small Indian settlement is located near the beach. Population, in 1881, 620; in 1901, 589.

CACTA'CEÆ. See **CACTUS**.

CACTUS (Lat., from Gk. *κάκτος*, *kaktos*). A general name given to the peculiar plants which belong to the family Cactaceæ. These plants have been specially adapted to the arid regions of America. They are chiefly displayed in Mexico, but are very abundant also along the Mexican border of the United States, and some of them extend even far north on the plains. They are also found to some extent more eastward, in the West Indies, and also southward in South America. Aside from a few African species, the 1000 known forms are restricted to America. However, the common prickly pear, a species of *Opuntia*, has been long naturalized throughout the Mediterranean region, where its fruit is known as the 'Indian fig.'

The peculiar habit of the family seems to have been the result of perennial drouth conditions, to which they have become better adapted, perhaps, than any other plant forms. The twofold problem which is presented to them is to prevent any unnecessary loss of water contained in their tissues, and to retain all of the scanty supply which reaches them. As a result, their bodies are very succulent, containing a large amount of water-storage tissue, which retains water with great tenacity. Their bodies are also very much reduced in surface exposure, leaves being abandoned, and the stem often assuming cylindrical to globular forms. The globular form is perhaps the most complete answer to the problem of reducing surface exposure and retaining mass. Instead of leaves and branches which appear upon ordinary plants, the cactus forms display various ephemeral or abortive structures, the most notable of which are the bristles and spines. The cactus forms are not all of compact habit, for species of *Pereskia* are climbing and woody, with well-developed leaves. The flowers of the group are usually conspicuous and remarkably brilliant in color. The largest forms are species of *Cereus*, with thick columnar and fluted bodies, bearing a few clumsy branches, and sometimes attaining a height of 50 or 60 feet. These tree-like columnar forms are especially well developed in the drainage basin of the Gulf of California, and sometimes occur in extensive masses known as 'cardon forests.'

About twenty genera of cacti are recognized, of which only five occur in the United States. The generic lines are, however, very uncertain and shifting, so that no definite number can be given. The most common genera are as follows: *Mammillaria* includes the globular to short cylindrical forms, which are not ribbed, but which have prominent tubercles bearing clusters of spines. It is the largest in point of numbers of all the genera, containing nearly three hundred species. *Echinocactus* also contains globular to short cylindrical forms, but they are strongly ribbed, and are usually larger than any of the *Mammillaria* forms. It is the second genus in point of numbers, containing about two hundred species. *Cereus* contains species with mostly elongated stems, which are stout, columnar, or sometimes

cylindrical, and always ribbed or angled. Species of *Pilocereus* are often seen in greenhouses, and resemble the columnar forms of *Cereus*, but have an abundance of white hairs instead of rigid spines, and are frequently spoken of as 'old-man cactus.' *Opuntia* contains about one hundred and fifty species, and includes forms which are branched and jointed, the joints being flat or cylindrical. The flat-jointed forms are the well-known 'prickly pears.' Consult: Engelmann and Bigelow, "Description of Cactaceæ," in *United States War Department Reports of Exploration for Railroad to the Pacific* (Washington, 1856); Kunzi, *Cactus; Its History, Classification, . . . and Therapeutical Application* (Albany, 1875); Coulter, *Preliminary Revision of the North American Species of Cactus, Anhalonium, and Lophophora* (Washington, 1894-98); and *Preliminary Revision of the North American Species of Echinocactus, Cereus, and Opuntia* (Washington, 1896).

CACTUS-WREN. See WREN.

CA'CUS. In Roman legend, a monstrous being (son of Vulcan, by some accounts) who dwelt in a cave on the Aventine Hill, before the foundation of Rome. When Hercules, returning to Greece with the cattle of Geryon, stopped to rest in the grassy plain by the Tiber, Cacus, selecting the most beautiful of the cows, drew them into his cave backward, by the tail, so that their tracks might not betray him; but their lowing, as Hercules, wonder-stricken, drove their mates away, attracted attention to the cave, and he slew Cacus. The story is told in Livy.

CADALSO, ká-dál'só, or **CADAHALSO,** ká'dá-ál'só, JOSÉ DE (1741-82). A Spanish poet, JOSÉ DE (1741-82). A Spanish poet of note, born in Cadiz. He distinguished himself in the war against Portugal, and rose to be colonel. At the siege of Gibraltar he was killed by the explosion of a bomb. His works include the tragedy *Sancho Garcia* (1771); the satire *Los Eruditos á la Violeta* (1772); and *Poesías* (1773). They appeared in a complete edition in 1818, as *Colección de obras en prosa y en verso* (Madrid).

CADA MOSTO, ká'dá mō'stō, or **CA DA MOSTO,** ALOIS, or LUGI DA (c.1432-c.80). An Italian navigator and discoverer, born in Venice. He made some commercial voyages about the Mediterranean and the Atlantic, and in 1455, under commission of the Infante Dom Henrique of Portugal, sailed, by way of Senegal and Cape Verde, to the mouth of the Gambia. In 1456 he undertook a second journey, discovered the Cape Verde Islands, and thence reached the mouth of the Rio Grande. He wrote an exceedingly interesting account of his voyages, *El libro de la prima navigazione per oceano alle terre de' Nigri della Bassa Etiopia* (1507).

CADASTRAL SURVEY (from Fr. *cadastre*, 'a public register of the quantity, value, and ownership of the real property of a country'). A term applied to a topographical survey, in mapping which the various artificial and natural objects are drawn to exact scale instead of being exaggerated for the sake of clearness, as is usually done in ordinary topographic mapping. See SURVEYING.

CADDIS-FLY. A neuropteroid insect of the order Trichoptera, the larvæ of which, usually

aquatic, are commonly known as case-worms. Caddis-flies show much resemblance to small moths, on account of their long antennæ, moth-like wings, and nocturnal flight. The body and wings are hairy, and some species possess scales. Four wings are generally present, but *Thamastes* has only the anterior pair, while in *Anamalopteryx* there is a curious dimorphism, the wings being quite short in the male, but of normal length in the female. They are seen mainly about streams and ponds, but a few are marine, and the genus *Onoicyla* is terrestrial. "The eggs are laid in a double mass, which is gelatinous and usually green in color. They are usually attached to the surface of some water plant. . . . The larvæ are all aquatic, . . . and they are nearly all protected by a case of some sort." These larvæ are long and cylindrical, with a hard head and thoracic segments, but soft abdomen, to cover which the worm forms a tubular shelter, composed of bits of sticks, moss, leaves, sand, or small stones, bound together with silk; and this is dragged about, or may be attached to some submerged object, preferably a stone at the bottom of rapidly running but shallow water. These cases are very diverse, from simple tubes to spirals very closely resembling snail-shells. Since they open behind, a current of water is allowed to pass through, and thus the respiratory filaments on the abdomen are aerated. The case-worm retains its hold in the tube by means of a pair of claws located at the apex of the abdomen. These larvæ are largely vegetable feeders, but will occasionally eat insects, and such species spin near the mouth of the tube a net of silk which is cup-shaped when drawn out by the water-current, and catches prey. The caddis-worms ('cad-bait' of anglers) live several months in this condition, and some regularly through the winter. "When ready to transform to pupa," says Howard, "both ends of the case or tube are protected by a silk netting spun by the larva, which transforms in security, well drawn back from either orifice. When ready to transform to the adult stage, the pupa works its way through the guarded orifice, swims to the surface of the water, and crawls out."

These insects have been but little studied in America; yet about one hundred and fifty species are known. They may be studied to advantage by placing the larvæ in a wire cage in their native stream, the cage extending above the water, so that the insect may emerge, but not escape. The most prominent family is Phryganeidæ, which contains the species of largest size. Consult McLachlan, *Monograph of the Trichoptera* (London, 1874-80), the authority for European forms. A list of species and key for genera, by N. Banks, may be found in *Transactions of the American Entomological Society* (Philadelphia, 1892); also a paper by Needham and Betten in the *New York State Museum Bulletin No. 47* (Albany, 1902).

CADDO, kád'dō. An important Indian confederacy, from which the Caddoan stock derives its name, formerly holding the territory from the middle Red River in Louisiana westward nearly to the Brazos River in Texas. The name by which the tribes call themselves is *Hasinai*, whence the French *Asinais* and *Cenis*, Caddo being the abbreviated form of the name of their principal tribe. There are about a dozen sub-

tribes, with ten gentes. Like most tribes of this stock, the Caddö were sedentary and agricultural, and were especially distinguished in early years for their friendly and hospitable character. They now number about 500, residing on allotments within their former reservation in western Oklahoma, which was opened to white settlement in 1901.

CADDOAN STOCK. An Indian linguistic group represented in the South by the Caddö and Wichita and associated tribes, and in the North by the Pawnee and Arikara (q.v.). Their original home seems to have been the lower Red River country of Louisiana and Arkansas, whence the Caddö and Wichita moved westward into Texas and the Indian Territory, while the Pawnee moved northwestward and settled upon the Lower Platte in Nebraska. The Arikara of North Dakota are a comparatively recent offshoot from the advance guard of the Pawnee. Like the Southern Indians generally, the Caddöan tribes were agricultural and more or less sedentary. In all their shifting they have retained these characteristics, preferring solidly built houses of earth-covered logs or grass thatch to the portable tepee, and depending more upon their gardens of corn and pumpkins than upon the buffalo-hunt. They have dwindled almost to disappearance, the entire stock numbering now only 1870 souls, although within living memory the Pawnee alone numbered 10,000.

CADE, JACK (?-1450). The leader of an insurrection beginning in Kent, England, June, 1450. He was of Irish birth, and had served in the French wars. Assuming the name of Mortimer, and claiming relationship with the Duke of York, Cade marched with 20,000 to 30,000 armed men on London, and encamped at Black Heath, whence he kept up a communication with the citizens, many of whom were in secret sympathy with the rising. The Court sent to inquire why the 'good men of Kent' had left their homes. Cade, in a paper entitled "The Complaint of the Commons of Kent," replied that the people were being robbed of their goods for the King's use; that mean and corrupt persons, who plundered and oppressed the commons, filled the high offices at Court; that it was "noised that the King's lands in France had been aliened"; that misgovernment had banished justice and prosperity from the land; that the men of Kent were especially ill-treated and overtaxed, and that the free election of knights of their shire had been hindered. In another paper, called "The Requests by the Captain of the Great Assembly in Kent," Cade demanded that the King should resume the grants of the Crown, which he complained the creatures about the royal person fattened on, while the King was compelled to live on taxation; that the false progeny of the Duke of Suffolk should be dismissed; and that the Duke of York and others should be restored to favor, and a number of persons punished. The Court sent its answer in the form of an army, before which Cade retreated to Seven Oaks, where he awaited the attack of a detachment, which he defeated. The royal army refused to fight against their countrymen; the Court made some concessions, and Cade entered London on July 3. For two days he maintained the strictest order; but he forced the Lord Mayor and the judges to pass judgment upon Lord Say, one of the King's most

unpopular favorites, whose head Cade's men immediately cut off in Cheapside. On the third day some houses were plundered, the leader himself, it is said, setting the example. Cade, who at night lodged his army in the suburbs, received news that the citizens intended to prevent his entrance into the city on the next day, and in the night he made an attack on the bridge, but was defeated. The promise of pardon sowed dissension among his followers, who dispersed, and a price was set upon Cade's head. He attempted to reach the Sussex coast, but was slain near Lewes by Iden, the sheriff of Kent, on July 11.

CADELL, FRANCIS (1822-79). A Scottish explorer, born at Cockenzie. In 1836 he entered the service of the East India Company as midshipman, and in 1844 was appointed to command a vessel. In 1848 an examination of the mouth of the Murray River, in Australia, convinced him of the navigability of that river, as to which he was further satisfied by an extended tour of exploration undertaken in 1850. He promoted the formation of a navigation company, the first of whose steamboats accomplished, in 1853, a voyage of 300 miles. Until 1859 he was busily concerned in explorations. In 1867, when sailing in command of a vessel from Amboyne to the Kei Islands, he was murdered by the crew.

CADENCE (Med. Lat. *cadentia*, from *cadere*, to fall). The 'fall' or close of a musical phrase or period. The term may apply to a melodic as well as an harmonic ending, and does not necessarily imply a 'fall' in pitch. In the most satisfactory final cadence, called Perfect, the melody passes upward to the final chord, so the term merely implies a subsiding from motion to rest, partial or complete. The word *cadence* is so inseparably associated with harmonic effects that we usually consider it in its specific sense, as the group of chords which form the harmonic turning-point or ending of every phrase, section, period, or complete movement. Cadences may be said to be the punctuation marks of the language of music. Some give the effect of finality—the full stop, or period. Others are merely pauses, like commas, and others, in their uncertain, questioning effect, are like interrogation marks. A final cadence, to give perfect satisfaction, must leave the tonality clearly defined by ending on the tonic chord; and its effect will be strengthened if the tonic tone is made especially prominent by appearing in the soprano as well as the bass. When the dominant or dominant seventh chord precedes the tonic, the cadence is called Authentic; where the subdominant chord precedes it, the cadence is Plagal. When, in either of these forms, the two chords are in fundamental position (*in chord*), and the soprano passes upward to the tonic, the cadence is Perfect. With any other movement of the voices, it is Imperfect.

The names Authentic and Plagal were used in early ecclesiastical music; and the latter cadence, called also the Amen cadence, is rarely used except in sacred music.

Directly opposed to the final character of the Authentic cadence is the *Half-Cadence*, called also the Half-Close, which ends on the dominant chord, preceded by the tonic. This gives the effect of an incomplete or partial close, and may be compared to a semicolon. When the chord of the dominant is followed by any other chord

except the tonic, the effect is that of avoiding or postponing the conclusion; and the cadence is called, variously, *Avoided*, *Deceptive*, or *Interrupted*. This harmonic turning-point is simply a pause, like a comma, or in some cases like an interrogation point. Illustrations of the various cadences will be found in any text-book on harmony. Consult, also, Gow, *The Structure of Music* (New York, 1895).

CADENCY (Med. Lat. *cadentia*, from *cadere*, to fall). In heraldry, the marks by which the shields of the younger members of families are distinguished from those of the elder, and from each other. The study of such devices constitutes an extensive and important branch of the heraldic science. Nine marks of cadency are recognized in modern heraldry. The first son bears the label (fig. 1); the second, the crescent (fig. 2); the third, the mullet (fig. 3); the fourth, the martlet (fig. 4); the fifth, the annulet (fig. 5); the sixth, the fleur-de-lys (fig. 6); the seventh, the rose; the eighth, the cross-moline; the ninth, the octofoil. This system may be indefinitely continued, by charging label upon

label, etc., for the grandsons. No distinction is usually made by writers on heraldry, and probably the practice of heralds in general scarcely admits of any being made, between *marks of cadency*, *differences*, *distinctions*, or even *brisures*, though the last term is quite constantly and appropriately used, to include not only differences in general, but also abatements (q.v.) or bearings by which the arms of the family are broken or diminished. See **BATON**.

CADENUS. A name assumed by Jonathan Swift in a poem addressed to Miss Vanhomrigh, and entitled *Cadenus and Vanessa*, which the lady's executors published in Dublin, in 1726, but which had been written more than ten years before. The name is an anagram for the Latin word *decanus*, i.e. dean. See **VANESSA**.

CADENZA, *It. pron. ká-dán'tsá* (It., descent, from Lat., It. *cadere*, to fall). In music, a brilliant passage of ornamental notes introduced toward the end of a musical composition and designed to give it a better rounding off. In instrumental pieces, it is usually based on themes of the work itself. In former times it was left to the performer to improvise his own *cadenzas*, but Beethoven was the first to compose them himself rather than rely on inapt performers. The practice of writing *cadenzas* is still kept up by famous players, as e.g. Ysaye in violin concertos, and Rosenthal and Sauer in piano-music.

CADER ID'RIS (Welsh, chair of Idris, the giant). A picturesque mountain ridge in Merionethshire, Wales, five miles south-southwest of Dolgelly (Map: Wales, C 4). It is seven miles long, and one to three miles broad; the highest

peak, Pen-y-Gader, reaches an elevation of 2925 feet. The view from the cairn at the summit extends across the Irish Sea, and as far as the Wrekin in Shropshire.

CADET, **MILITARY** (Fr., younger brother, Provençal *capdet*, from Med. Lat. *capitellum*, dim. of Lat. *caput*, head; so called to distinguish him from the elder brother, who was the real head of the family, after the father. The military meaning arose from the fact that the younger sons of the French nobility were generally provided for in the army). A student or an accepted candidate for a military commission. In the United States Army, cadets are educated at the Military Academy, West Point, N. Y. (q.v.), and the present method of their appointment has been in operation since 1843. The age for admission to the Military Academy is between 17 and 22 years of age, appointments, as a rule, being made one year in advance of the date of admission. Application is permissible at any time, by letter to the Secretary of War, to have the name of the applicant placed upon the file, from which it is furnished to the proper Representative or Delegate when a vacancy occurs. Application may also be made to the Congressman direct. Each Congressional district and Territory—also the District of Columbia—is entitled to have one cadet at the Academy. Each State is entitled to have two cadets from the State at large, and thirty are appointed from the United States at large. The appointment from a Congressional district is made upon the recommendation of the Congressman from that district, and those from a State at large upon the recommendations of the Senators of the State. Similarly, the appointment from a Territory is made upon the recommendation of the Delegate in Congress. Each person appointed must be an actual resident of the State, district, or Territory from which the appointment is made. The appointments from the District of Columbia and from the United States at large are made by the President of the United States upon his own selection. These latter appointments were originally designed for the benefit of sons of army officers, who, having no permanent abode, are thus debarred from securing an appointment in the usual way. The course of instruction covers a period of four years, and at its conclusion the cadets are commissioned second lieutenants in the United States Army. See **MILITARY ACADEMY**, **UNITED STATES**, for account of the education of cadets, and also for an historical sketch of the institution.

In England, cadets are trained at Woolwich (q.v.) and Sandhurst (q.v.), artillery and engineer cadets going to the former, and those destined for cavalry and infantry going to the latter. A similar system of appointment, preparation, and education of military cadets prevails among all European armies, further details of which may be found under **MILITARY EDUCATION**; **ÉCOLE POLYTECHNIQUE**; **SANDHURST**; **STAFF COLLEGE**.

CADET, **NAVAL**. The lowest grade of officers of the line, or executive branch, in the United States and other navies. In the United States Navy the title was *cadet-midshipman* until changed by act of Congress in 1882. In 1902 an act of Congress was passed and approved restoring the old title of *midshipman*. The cadets are under instruction at the Naval Academy, Annapolis, for four years, and then serve two

years at sea in regular cruising ships, when they are commissioned as ensigns. The ages of entrance to the Academy are from 15 to 20 years, but efforts are being made to reduce the upper age limit to eighteen. According to the present law, the number of cadets allowed at the academy is one for each Representative and Delegate in Congress and appointed by them, and ten at large and one for the District of Columbia appointed by the President. See NAVAL ACADEMY, UNITED STATES.

The number of cadets in foreign navies is limited by the number of applicants or the requirements of the service. The examination of cadets for the British Navy takes place in London and Portsmouth in March, July, and November, and the limits of age are 14½ and 15½ years. The cadets are trained on board the old line-of-battle ship *Britannia*. In France the school for naval cadets is on board the stationary training-ship *Borda*, at Brest. The period of training is two years, and the age of entrance is from 14 to 18 years. In Germany the naval cadets are instructed at the Naval Academy at Kiel. The age of entrance must not exceed 19 years, and the requirements are such that very few boys under 16 are likely to pass the entrance examination.

CADI, Arab. pron. kā'dē, or **KADI** (Ar. *qadi*, judge, from *qaday*, to judge). The title of an inferior judge among the Mohammedan nations, who, like the Mollah (q.v.), or superior judge, was originally also a theologian, since all law is founded upon the Koran. The Cadi is differently appointed in different countries; in Turkey, where he is also called Naib, he is appointed by the Mufti or Sheikh ul-Islam, the head of the Mohammedan Church, and receives a fixed salary; in Persia and in Middle Asia the Cadi's office is more in the nature of a private affair.

CADILLAC. A city and county-seat of Wexford County, Mich., 98 miles north of Grand Rapids, on the Ann Arbor and the Grand Rapids and Indiana railroads (Map: Michigan, H 4). It is picturesquely situated on Little Clam Lake in a noted hard-wood timber region, and has extensive lumber interests. Settled in 1871, Cadillac was incorporated in 1874, and is now governed under a revised charter of 1895, which provides for a mayor elected annually, and a city council. Population, in 1890, 4461; in 1900, 5997.

CADILLAC, kā'dē'yak', ANTOINE DE LA MOTHE (c.1660-1720). A French military officer, the founder of Detroit, Mich. He was born in Gascony, of a noble French family, spent some time in Acadia as a captain in the French Army, and in 1694 was appointed by Frontenac commander of Michilimackinac. Here he remained until 1697, when he laid before Louis XIV. his plan for a permanent settlement as a trading-post for the Northwest. With the King's approval he founded Detroit in 1701, with fifty settlers and fifty soldiers. He was Governor of Louisiana from 1712 to 1717, when he returned to France, where he died. Consult Parkman, *A Half Century of Conflict* (Boston, 1892).

CADIZ, Sp. pron. kā'bēth (Fr. *Cadix*; anciently, Lat. *Augusta Iulia Gaditana*, earlier *Gades*, Gk. *Gadeira*, *Gadeira*, from Phœnician *Gadir*, hedge, stockade, fort). A city of Spain,

in Andalusia, capital of the province of its name and one of the most important seaports of the kingdom, situated on the Atlantic (Map: Spain, C 4). It is built on a narrow tongue of land projecting from the Isla de Leon. The harbor of Cadiz is spacious, strongly fortified, and divided into two parts, the large roadstead between Santa Catalina and Cadiz, and the smaller but safer harbor between the fortifications of Matagorda and Puntales. The town is surrounded by strong walls on the northwest and south, and by numerous fortresses which guard the entrances to the outer and inner harbors.

Cadiz presents a picturesque appearance, the whiteness of its buildings forming a striking contrast with the blue ocean. In its arrangement, it is one of the most modern of Spanish cities, and although its limited site does not admit of wide avenues or extensive squares, its narrow streets are well paved and lighted, and scrupulously clean. The houses are invariably white-washed, and in most cases surmounted by towers, or *miradores*, affording an excellent view of the sea. The main street is the Calle del Duque de Tetuan, and the chief squares are the Plaza de la Constitución, Plaza de Mina, and Plaza de la Catedral. Cadiz has a fine promenade, the Alameda de Apodaca, extending along the water on the north, and the extensive Parque Genoves with a summer theatre. The two cathedrals are of recent construction, and possess little architectural merit. In the southern part of the city is situated the old Capuchin convent, now used as an asylum, with the small church of Santa Catalina, containing Murillo's "Betrothal of Saint Catharine," a work which derives special interest from the fact that the master died while engaged in its execution. In the centre of the town is situated the Torre de Vigia, a watch-tower about 100 feet high, used as a signal station, and affording a magnificent ocean view. Cadiz, in spite of its maritime position, has a very hot and rather unhealthy climate, which, together with the inadequate water-supply, causes the high death-rate of about 44 per 1000. The city is the seat of a bishop and of a number of consular representatives. The educational institutions include a faculty of medicine affiliated with the University of Seville, schools of art and commerce, a theological seminary, and a number of minor schools. There are also a number of theatres and libraries, and an archaeological museum. The Academia de Bellas Artes contains a fine gallery of Italian and Spanish paintings.

The commercial importance of Cadiz has been gradually declining, owing to the decreased communication with South America and the West Indies. The chief exports are sherry, olive oil, salt, and southern fruits. There is regular steam communication with Great Britain, the Canary Islands, the West Indies, France, South America, and Morocco. Population, in 1887, 62,531; in 1897, 70,177.

History.—Cadiz is one of the most ancient towns in Europe, having been built by the Phœnicians, under the name of Gaddir, about 350 years before the foundation of Rome, or about B.C. 1000. It afterwards passed into the hands of the Carthaginians, from whom it was captured by the Romans, who named it Gades, and under them it soon became a city of vast wealth and importance. It was occupied by the Goths from the

dissolution of the Roman Empire to the battle of the Guadalete, when the Moors took possession of the southern peninsula. It was taken by the Christians in 1262. In 1587 Drake destroyed the Spanish ships of war at Cadiz. In 1596 the town was captured and sacked by the English under Howard and Essex. The French invested the place in 1810-12, but were compelled to raise the siege. In 1823 the Cortes retired to Cadiz and made a stand against the French army of invasion. In August the French stormed the Trocadero, and the struggle of the Constitution-
alists was brought to a close.

CADIZ. A village and county-seat of Harrison County, Ohio, about 25 miles northwest of Wheeling, W. Va., on a branch road connecting with the Pittsburg, Cincinnati, Chicago and Saint Louis Railroad (Map: Ohio, H 5). It has important commercial interests in wool, and, though but a village, is noted as a banking centre, ranking among the leading municipalities of the State. Cadiz was the home of Edwin M. Stanton. Population, in 1890, 1716; in 1900, 1755.

CADME'A, or **CADMEI'A**. The name given to the acropolis of Thebes, Bœotia, because it was said to have been founded by Cadmus. The citadel was a low eminence and antedated the surrounding city. Only fragments of its walls remain.

CADME'ANS, or **CADMEI'ANS**. The name given to the inhabitants of Bœotian Thebes by the Greek dramatists.

CADMEAN VICTORY. A popular expression for a gain secured at great loss, and referring to the mutual slaughter of the warriors who sprang up from the dragon's teeth sown by Cadmus.

CAD'MIA (Lat., the ore of zinc, dross or slag formed in a furnace, from Gk. *kadmia*, *cadmia*, calamine). The term applied to the rust formed in zinc furnaces, which contains from 10 to 20 per cent. of cadmium.

CAD'MIUM (Neo-Lat., from Lat. *cadmia*, or *CAD'MIA*). A metallic element discovered in 1817 by Stromeyer. It is not found native, but occurs as the sulphide in the mineral greenockite, and in association with zinc ores. Greenockite is found in Bohemia and in Hungary; also in Leigh County, Pa., but in too small quantities to be of commercial importance.

Cadmium is a constituent of most zinc ores, and as it is more volatile than zinc it passes over first, in the reduction of such ores, as cadmium oxide. This is collected, mixed with charcoal, and the mixture heated in iron tubes, from which the cadmium distills over in a more or less impure state. In order to purify it, the metal is redistilled and the product dissolved in hydrochloric acid, from which solution metallic cadmium is precipitated with zinc.

Cadmium (symbol, Cd; atomic weight, 112.38) is a bluish-white lustrous metal with a fibrous fracture, and capable of taking a high polish. Its specific gravity is 8.65. It melts at 320° C. (608° F.) and boils at 763° C. (1405.4° F.). It finds some use in the manufacture of alloys, as it generally increases the fusibility of metals without destroying their malleability. An amalgam of cadmium and tin is used in dentistry.

Cadmium forms a regular series of salts, of which the iodide, obtained by digesting one part of the metal with two parts of iodine in water

and evaporating the solution, is used in medicine, and also for iodizing collodion. The most important compound of cadmium is the sulphide, which is precipitated from a solution of a cadmium salt by hydrogen sulphide. Cadmium sulphide is an orange or lemon-yellow powder that is of great permanency, and is used as a pigment under the name of *cadmium yellow*. It is also used for coloring toilet soaps, for the production of blue flames in pyrotechny, and in calico-printing.

CADMUS (Gk. *Kádmos*, *Kadmos*). According to Apollodorus and the later mythographers, the son of Agenor, King of Phœnicia, and Telephassa, and brother of Europa. When the latter was carried off by Zeus, he and his brothers, as also their mother, were sent in quest of her, with injunctions from Agenor not to return without her. Their search was vain, and the oracle at Delphi told Cadmus to relinquish it, and to follow a cow which he should meet, and build a city where it should lie down. He found the cow in Phocis, followed her to Bœotia, and built there the city of Thebes, of which the acropolis was called Cadmea. At Thebes he killed a dragon, guardian of the well of Ares, and sowed its teeth, from which sprang armed men. These fought together till only five remained, who took service with Cadmus and became the ancestors of Theban families. Cadmus married Harmonia, daughter of Ares and Aphrodite, and later went to Illyria. He was considered the inventor of many useful arts, and to him was attributed the introduction of the Phœnician alphabet into Greece. This story, however, is unknown to the earlier Greek writers, and has been compiled out of many scattered and often inconsistent local legends. The Phœnician origin of Cadmus seems an invention of the Asiatic Greeks, and it is quite impossible to use the story as a basis for any historical narrative of Phœnician colonists in Bœotia. For a full collection of the material and bibliography, consult Crusius, s. v. "Kadmos," in Roscher, *Lexikon der Mythologie* (Leipzig, 1884).

CADO'GAN, GEORGE HENRY, Earl (1840—). A British statesman. He was born in Durham and studied at Christ Church College, Oxford. In 1873 he was returned as a member of Parliament for Bath, and in 1875 was appointed Parliamentary Secretary for War. From 1878 to 1880 he was Under-Secretary for the Colonies, and from 1886 to 1895 Lord Privy Seal. From 1895 to 1902 he served as Lord Lieutenant of Ireland. He took a prominent part in the discussion of the Irish Land Bill in 1887.

CADOL, *ká'dól'*, VICTOR EDOUARD (1831-98). A French dramatist, born in Paris. He was at first in the Government service, but afterwards became a journalist, was a member of the *Temps* staff, and with About, Sarcey, and Gasperini founded *L'Esprit Français*. He published a long list of works, many written in collaboration. There may be mentioned *Les ambitions de M. Faurel* (1867); *La fausse monnaie* (1869); *Le spectre de Patrick* (1872); *Thérèse Gervais* (1893); and *L'archiduchesse* (1897). His dramatic works were collected in 1897 as *Théâtre inédit* (1897).

CAD'OOBER'GIA WOOD. See EBONY.

CADOENA, *ká-dór'ná*, RAFFAELE (1815-97). An Italian general, born in Milan. During the Crimean War he commanded a battalion of in-

fantry, and in 1854 served as a lieutenant-colonel on the general staff. In 1860 he was appointed Minister of War in the Provisional Government of Tuscany, and in 1866 military commandant of Sicily. He was sent in the latter year to Palermo and succeeded in crushing the remnants of the Bourbon insurrection. In 1870 he captured Rome, of which he was for a time military Governor. In 1871 he became a member of the Senate. He published *La liberazione di Roma nel 1870* (1889).

CADOUDAL, ká'dō's'dál', GEORGES (1771-1804). The leader in the Chouan insurrection during the French Revolution. He was born near Auray, in Lower Brittany, where his father was a miller, and was among the first to take up arms against the Republic, soon acquiring great influence over the peasants. Captured in 1794, he was sent as a prisoner to Brest, whence he soon made his escape. Annoyed at the dissensions between the Vendean generals and the emigrant officers, and the disasters consequent thereon, Cadoudal organized an army in which no noble was permitted to command, and which it taxed all the great military talents of Hoche to disperse. In 1797 Cadoudal was the soul of the conspiracy to overthrow the Directory and place a Bourbon on the throne; but the events of the 18th Fructidor frustrated the plan of the conspirators. He continued to carry on a guerrilla warfare in Lower Brittany long after the regular armies of the Vendée had surrendered. Bonaparte recognized Cadoudal's energy and force of character, and offered to make him a lieutenant-general in his army. Cadoudal refused. Fearing arrest, he fled to England, where, in 1802, he conspired with Pichegru for the destruction of the First Consul. With this design he went to Paris, but was arrested, condemned, and executed June 25, 1804. Cadoudal was a man of stern honesty and indomitable resolution. "His mind was cast in the true mold; in my hands he would have done great things," was Napoleon's estimate of him. Consult Georges de Cadoudal, *Georges Cadoudal et la Chouannerie* (Paris, 1887).

CADRE, ká'dr' (Fr., frame, from Lat. *quadrum*, square). The commissioned and non-commissioned staff officers, including the artificers and musicians, of a regiment. The term includes practically all the officers, non-commissioned officers, and men necessary in the construction of a framework or organization, around which may be assembled the rank and file required to constitute a regiment. It is peculiarly a French institution, and has particular application to the permanent regimental headquarters staff, round which a reserve regiment would assemble if mobilized.

CADUCEUS, ká-dū'sé-ūs (Lat., from Gk. κηρύκειον, *kérykeion*, Æol. κηρύκειον, *karykion*, herald's staff; for the interchange of *p* and *b*, cp. *ar-biter* for **ad-biter*). The winged staff of Mercury, or Hermes, as he was called by the Greeks. In its earliest form it is composed of three branches, one forming the handle, and the other two intertwined. This is also the herald's staff, as it appears in early works of art, and is borne also by Iris, as well as earthly messengers. Later, the place of the intertwined branches is taken by snakes, and in a still later form the staff is furnished with wings. Homer refers to the magic golden wand of Hermes, but without reference to its form.

Among the moderns the caduceus is used as an emblem of commerce, over which Mercury was the presiding divinity.

CADWALADER, kád-wöl'a-dēr, GEORGE (1804-79). An American lawyer and soldier. He was born in Philadelphia, where he studied law and practiced that profession. He was a brigadier-general of volunteers in the Mexican War and for gallantry at Chapultepec was brevetted major-general. He again practiced law until the outbreak of the Civil War, became a major-general of volunteers in April, 1862, and in the same year was appointed a member of the commission to revise the military laws and regulations of the United States. He was the author of *Services in the Mexican Campaign of 1847* (1848).

CADWALADER, GEORGE, GENT. An assumed name of George B. Dodgington.

CADWALADER, or **CADWALLADER**, JOHN (1742-86). An American soldier. He was born in Philadelphia, where he served as a member of the Committee of Safety, and at the beginning of the Revolutionary War was made commander of the Pennsylvania militia, with the rank of brigadier-general. He participated in the battles of the Brandywine, Germantown, Monmouth, and Trenton, and in July, 1778, fought a duel with Gen. Thomas Conway, the leader of the cabal against Washington. (See CONWAY CABAL.) Subsequently General Cadwalader was a member of the Maryland Legislative Assembly.

CADWALLADER. In Foote's farce, *The Author*, a character burlesquing a certain Mr. Aprice, his friend, who later secured the play's withdrawal.

CADWALLADER, REV. MR. The easy-tempered village parson in George Eliot's *Middlemarch*.

CADWALLON, kád-wöl'lon. A harper in Scott's *The Bethrothed*, who is killed for disguising himself as Vidal.

CÆCILIIDÆ, sēs'ī-lī'f-dē (Neo-Lat., from Lat. *Cæcilia*, a kind of lizard, from *cæcus*, blind). A family of degenerate, worm-like, burrowing amphibians of the tropics. See BLIND WORM, 3.

CÆCILIA GENS. A plebeian clan of Rome of which mention is found in the Fifth Century B.C. Its family names are Bassus, Denter, Metellus, Niger, Pinna, and Rufus.

CÆCILIA METELLA, TOMB OF. The most conspicuous ruin on the Appian Way, near Rome, the magnificent burial-place of the daughter of Metellus Creticus and daughter-in-law of the triumvir Crassus. The tomb formerly known as Capo de Bove, from its frieze of ox-skulls, is a circular edifice measuring 65 feet in diameter, standing on a square base. The whole was sheathed with travertine, which was removed under Pope Sixtus V. for use in other buildings. The tomb was converted into a battlemented stronghold in the Thirteenth Century. The secret passage to the crypt was accidentally found by workmen who were dismantling the base in the Sixteenth Century. The sarcophagus is still preserved.

CÆCILIUS STATIUS, sē-sīl'ī-ūs stā'shī-ūs (B.C. ? -168). A Roman comic poet and dramatist, of whose works few fragments remain. The people ranked him with Plautus and Ter-

ence. Consult Ribbeck, *Comicorum Romanorum Fragmenta* (Leipzig, 1873).

CÆCOMORPHE (Neo-Lat., from Lat. *cæcus*, blind + Gk. *μορφή*, *morphē*, shape, form). An order of birds agreeing in cranial structure (schizognathous and schizorhinal), externally characterized by having palmate feet, and embracing the loons, grebes, sea-fowl, gulls, albatrosses, petrels, and allied forms.

CÆCUM, *sē'kūm* (Lat. *cæcus*, blind). A blind pouch in the human intestine into which the small intestine empties. It is also called the *caput coli*, or head of the colon. The colon, or large intestine, starts from it, in the hollow of the right iliac region, and runs upward, in its first part. The cæcum in man is too small to serve as an important part of the digestive tract, and is comparatively useless. From it springs the vermiform appendix (q.v.), generally posteriorly, the lumen of the appendix opening into the cavity of the cæcum. The microscopic structure of the walls of the cæcum does not differ in any essential from that of the rest of the large intestines. (See **INTESTINES**.) There are four coats, the mucous, the sub-mucous, the muscular, and the serous. The mucous coat consists of a lining of simple cylindrical epithelium, which is continuous with the epithelium of simple tubular glands, which lie side by side, and are supported by a loose lymphoid connective-tissue stroma. Beneath this is a single or double layer of muscle, the *muscularis mucosæ*. Beneath this is a vascular connective-tissue layer, the *sub-mucosa*, which often contains lymph nodules. Passing outward from the sub-mucosa, the next coat is the muscular, divided into an inner layer, whose cells are disposed circularly to the lumen, and an outer layer, whose cells have their long axes directed longitudinally. In the cæcum and large intestine the circular layer is usually thinner than in other parts of the gastro-intestinal canal, and the outer layer is incomplete, being arranged in three longitudinal bands, which are shorter than the other coats of the intestines and give it a sacculated appearance. The serous coat is a thin connective-tissue layer covered over with a single layer of flat endothelial cells.

CÆCUM IN ANIMALS. In many of the mammalia, and particularly in most of those which are herbivorous, the cæcum is comparatively large, and is found to secrete an acid fluid resembling the gastric juice. It therefore appears that, where the nature of the assimilatory process is such as to require the detention of the food for a considerable time, this provision is made for it in order that digestion may be more completely accomplished. The cæcum is entirely wanting in some quadrupeds, as in bats, and the bear and weasel families. Birds have two cæca, which are generally long and capacious in those that are omnivorous or granivorous, and the position of which is the only circumstance that marks the division of the intestine into two parts, the small and the large intestine, or the *ilicm* and the *colon*. The first traces of the true cæcum are found in reptiles, where it is mostly of small size. Fishes have no true cæcum occurring in the position occupied by those of quadrupeds and birds, but many of them have fluid sacs attached to the intestine at its uppermost part, known as pyloric cæca, and serving to increase the digestive surface. The number of these cæca, however, is extremely various; sometimes there

is only 1, and sometimes nearly 200. The number is different even in very nearly allied species of the same family; thus, there are only 6 in the smelt, but 70 in the salmon, 24 in the herring, and 80 in the shad. In some fishes, as in the cod, the cæcum consists of large trunks ramified into smaller ones.

CÆDMON, *kād'mon*. An English poet of the second half of the Seventh Century. The only information of any weight concerning him is in Bede's *Ecclesiastical History* (iv. 24), which was completed in 731. According to Bede, Cædmon was a man of 'secular habit,' living in the monastery at Whitby, in old Northumbria. One night while sleeping in the stables, he saw a vision, whence came a voice commanding him to sing the origin of created things. Cædmon immediately began to sing of God the Creator. After relating the story of the poet's inspiration, with many details, Bede says: "Thus sang he of the creation of the world, and the beginning of the race of men, and all the history of Genesis; of the exodus of Israel from Egypt, and the entrance into the promised land; of many other stories of the Holy Scriptures; of the incarnation of the Lord, His passion, resurrection, and ascension; of the coming of the Holy Ghost, and the teachings of the Apostles; also of the terrors of the future judgment and the horror of hell-punishment, and the sweetness of the heavenly kingdom." There is now in the Bodleian Library, Oxford, a MS. (West Saxon, Tenth Century) of sacred epics, of which the poems known as Genesis, Exodus, Daniel, Christ, and Satan, correspond with the substance of Cædmon's *Paraphrase*, as described by Bede. They have been ascribed as a whole, or in part, to Cædmon. The best criticism, however, holds that some of them, and perhaps none, are his; that they belong, rather, to a class of popular religious poems, which may be called, if one likes, Cædmonian. The theme of these poems anticipates that of Milton's great epics; and attempts have been made to connect Milton directly with the Cædmon *Paraphrase*. Other poems besides those mentioned have been credited to Cædmon. Of great philological interest—for it is written in the Northumbrian dialect—is the hymn which Cædmon is supposed to have composed in his dream. These verses are preserved in a MS. of Bede's *History*, now at Cambridge. For text of the Cædmon poems, consult: Grein-Wülker, *Bibliothek der angelsächsischen Poesie*, Vol. II. (Leipzig, 1894); for a translation, Thorpe, *Cædmon* (London, 1832); for account of Cædmon and the poems, ten Brink, *Early English Literature*, translated (London, 1883); and Morley, *English Writers*, Vol. II. (London, 1888).

CÆLIA GENS. A plebeian clan of Rome with the family names *Caldus* and *Rufus*. The gens name is generally written *Coelius* on coins.

CÆLIAN. One of the seven hills of Rome. See **ROME**.

CÆLIMONTANA. The smallest of the regions of Augustus in Rome. It included the Cælian Hill and contained the Temple of Claudius, the palace of Commodus, and the great market of Nero.

CÆLIUS, MARCUS RUFUS. A Roman noble of the First Century B.C. He had considerable talent as a writer and orator, but was conspicuous for his profligacy. In B.C. 56 Clodius's sister,

Clodia Quadrantaria, whom he had deserted, accused him of having made an attempt to poison her, and of having borrowed money from her in order to procure the murder of Dion, the Alexandrian ambassador. Cicero defended him in an oration which is still extant (Cicero, *Pro Cælio*). On the outbreak of the Civil War in 49, he supported Cæsar, who rewarded him by appointing him to the prætorship in B.C. 48. Soon afterwards his own enormous debts led him to bring forward a law for the abolition of debts, whereupon he was deprived of his office. He was killed at Thurii while attempting to raise an insurrection in favor of Pompey. Cælius was a friend of Catullus, who addressed two of his poems to him (*Carmina*, LVIII. and C).

CÆLIUS AURELIANUS. A Latin medical writer in the Fifth Century A.D., a resident of Sicca in Africa. He translated from the Greek an important work on acute and chronic diseases, which is still extant. He was an exponent of the 'methodic' school of medicine.

CAEN, kæn (anciently, Lat. *Cadomum*). The capital of the Department of Calvados, France, formerly the capital of Lower Normandy, situated on the left bank of the Orne, about 9 miles from its mouth and 149 miles west-northwest of Paris (Map: France, F 2). Caen is built in the middle of a fertile plain; its streets are wide and clean; it has several fine squares, and many noble specimens of ancient Norman architecture. Among the best examples are the churches of Saint Etienne, founded by William the Conqueror, and which contained his monument, erected by William Rufus, and destroyed by the Huguenots in 1562; La Trinité, called also Abbaye aux Dames, founded by Matilda, wife of the Conqueror; Saint Nicholas, now a cavalry fodder store; Saint Pierre; and Saint Jean. The castle, founded by the Conqueror, and finished by Henry I. of England, was partially destroyed in 1793. There are a university with 60 professors and 600 students, a museum with a splendid art collection, a public library with over 100,000 volumes, and many other educational and industrial institutions. The city has manufactures of lace, blonde, crape, cutlery, cotton-yarn; breweries, dye-works, wax-bleaching, and ship-building yards. Its Angora gloves, made from the unwashed, undyed fur of Angora rabbits, which are reared in the district, are celebrated. Quarries in the neighborhood produce Caen stone. Trade is facilitated by a maritime canal connecting the port with the sea, and also by ample railway connections. Population, 1896, 45,380. Consult Delarue, *Histoire de Caen* (Paris, 1842).

CAEN (kæn or, Fr. pron., kæn) **STONE.** A soft, light-colored limestone well adapted for plain and carved ornamental work, obtained near Caen, in Normandy. The quarries have been celebrated since a very early period. The excellence of the stone and the facility of transport by sea led to the very extensive use of Caen stone in England in the Fifteenth and Sixteenth centuries. In 1460 the Abbot of Westminster obtained a license to import Caen stone for the repairs of the monastery. Later it became a regular article of importation, and in 1582 it was rated at the custom-house at 6s. 8d. the ton. Winchester and Canterbury cathedrals, Henry VII.'s chapel at Westminster, and many

churches are built of Caen stone, which is still frequently used in England. The quarries are subterranean, and the stone, in blocks of 8 or 9 feet long and about 2 feet thick, is brought to the surface through vertical shafts. Owing to its porous and soft nature, the stone is unfitted for exterior work in a severe climate like that of the United States. See LIMESTONE.

CÆRE, sê're. See CERVETRE.

CAERLEON, kâr-lē'on (Welsh, *caer*, fortress, castle, town + *leon*, legion). An ancient town in Monmouthshire, England, on the Usk, two miles northeast of Newport (Map: England, D 5). It is the Isca Silurum of the Romans, and is supposed to have been the capital of the Roman Province of Britannia Secunda, now Wales, and the residence of the famous King Arthur. It was the seat of an ancient archbishopric, which was removed to Saint David's in the Eleventh Century. Many Roman remains have been discovered in the neighborhood, and a great number of the smaller antiquities have been gathered into a very fine collection in the town museum. Near by is a large amphitheatre; also an artificial mound which has been given the name of King Arthur's Round Table. Population, in 1891, 1411; in 1901, 1367.

CAERNARVON, kâr-nâr'von. See CARNARVON.

CÆBULAERIUS, MICHAEL. The Patriarch of Constantinople from 1043 to 1059, who completed the breach prepared by Photius between the Latin and Greek churches. He did away with the use of the Latin ritual in many Bulgarian churches, and in a letter to the Bishop of Trani, Apulia, made formal attack upon Rome. His complaints were bitter restatements of those long previously made, including particularly the use by the Latins of unleavened bread in the sacrament of the Lord's Supper. In consequence of this letter, Pope Leo IX. sent to Constantinople ambassadors who were kindly received by the Emperor Constantine Monomachus, but resisted by Michael, who later succeeded in influencing the Emperor's attitude. Thereupon the Papal legates deposited on the altar of the Church of Saint Sophia a bull of excommunication, and departed. Michael continued in power until banished by the Emperor Isaac Comnenus in 1059. There are extant some decretals of Michael, and Henricus Canisius gives several letters in his *Antiquæ Lectiones*. Consult Pichler, *Geschichte der kirchlichen Trennung zwischen dem Orient und Occident* (Munich, 1864).

CÆSALPINIA (after the Italian botanist Cæsalpinus). A genus of trees of the order Leguminosæ, the type of the sub-order Cæsalpinieæ. This sub-order is characterized by irregular flowers, which are not papilionaceous, and contains more than 700 known species. Among the members of the groups many are notable for their purgative properties, as senna (q.v.); some produce eatable fruits, as the tamarind (q.v.), the carob (q.v.), and the West Indian locust-tree (q.v.); some yield resinous and balsamic products, as copaiva (q.v.) and aloes-wood; some produce important dye-woods, as logwood (q.v.); brazilwood (q.v.), and camwood (q.v.); and some are trees of great size, and very valuable for their timber, as the purplewood (q.v.) and the wallaba trees of Guiana. No species of the sub-order is British, and it generally be-

longs to warm climates. The genus *Cæsalspinia* contains about fifty species of trees and shrubs with pinnate or bipinnate leaves, handsome purple or yellow flowers in racemes, natives of the warm parts of Asia and America, which yield the brazilwood, Pernambuco-wood, and sapanwood (q.v.) of commerce, also the astringent pods called *dividivi* (q.v.), used in tanning. Some of the species are highly ornamental, as the royal poinciana (*Cæsalspinia regia* or *Poinciana regia*) and the dwarf poinciana (*Cæsalspinia pulcherrima*).

CÆSALPINUS, sēs'al-pī'nūs. See **CESALPINO**.

CÆSAR. The cognomen of the most renowned branch of the patrician *Gens Julia*, which claimed descent from the mythical Iulus, son of Æneas. The earliest mentioned in history is Sextus Julius Cæsar, who held the office of prætor in B.C. 208. The great Cæsar (see below) left no direct male descendant to bear his name, but by his adoption of Octavius (afterwards the Emperor Augustus) the name passed to him, and from Augustus, also by adoption, to his immediate successors Tiberius and Caligula. Claudius and Nero, though not Julii, continued the name, which died out as a family name when Nero was killed. Henceforth it became a title of the reigning emperor; Vitellius alone refused to accept it. From Trajan's reign it stands regularly after the name 'emperor'; *imperator Cæsar*. Later the title *Cæsar* was used to designate especially the heir presumptive to the throne, though it did not cease to be part of the imperial title. From it are derived the titles of the Russian Czar and the German Kaiser.

CÆSAR, DON. In Mrs. Cowley's *Bold Stroke for a Husband*, Olivia's father, an old man who makes loves to a young girl, in order to lead his daughter to marry.

CÆSAR, GAIUS JULIUS (B.C.100-B.C.44). A famous Roman general, statesman, and writer; one of the most remarkable men of all time. He was the son of a Roman prætor of the same name, and was born July 12, B.C. 100. Two circumstances conspired to determine his sympathies in favor of democracy, and against a republican oligarchy. The first was the marriage of his aunt Julia with Gaius Marius; the second, the marriage of Cæsar himself, in B.C. 83, with Cornelia, daughter of L. Cinna, one of the principal enemies of Sulla. The anger of the dictator at this cost Cæsar his rank, property, and almost his life itself. Feeling that he would be safer abroad for a time, he went to Asia (B.C. 81); but on learning of the death of Sulla (B.C. 78), he hurried back to Rome, where he found the popular party in a state of great ferment, and anxious to regain what it had lost under the vigorous despotism of the aristocratic dictator. Cæsar, however, took no part in the attempts of Lepidus to overthrow the oligarchy; but he showed his political leanings by prosecuting (B.C. 77) Cn. Dolabella—a great partisan of Sulla—for extortion in his Province of Macedonia. To improve his eloquence, he went to Rhodes to study under the rhetor Apollonius Molo. In B.C. 74 he returned to Rome, where he had been elected pontifex, and now for the first time threw himself earnestly into public life. In the year B.C. 70 he attached himself to Pompeius, whose political

actions at this time were of a decidedly democratic character. In B.C. 68 Cæsar obtained a questorship in Spain. On his return to Rome (B.C. 67) he married Pompeia, a relative of Pompeius, with whom he was daily becoming more intimate. In B.C. 65 he was elected to the curule ædileship, and lavished vast sums of money on games and public buildings, by which he increased his already great popularity. For the next few years Cæsar is found steadily skirmishing on the popular side. In B.C. 63 he was elected Pontifex Maximus, and shortly after prætor. During the same year occurred the famous debate on the Catiline conspiracy, in which the aristocratic party vainly endeavored to persuade the consul, Cicero, to include Cæsar in the list of conspirators. In B.C. 62 Pompeius returned from the East, and disbanded his army. Next year Cæsar obtained, as proprætor, the Province of Hispania Ulterior. His career in Spain was brilliant and decisive. On his return he was elected consul, along with M. Calpurnius Bibulus (B.C. 60). Cæsar, with rare tact and sagacity, reconciled the two most powerful men in Rome, who were then at variance—Pompeius and Crassus—and formed an alliance with them, known in history as the *First Triumvirate* (B.C. 60). Both of these distinguished men aided Cæsar in carrying his Agrarian Law (B.C. 59); and to strengthen still further the union which had been formed, Cæsar gave Pompeius his daughter, Julia, in marriage, though she had been promised to M. Brutus; while he himself married Calpurnia, daughter of L. Piso, his successor in the consulship. On the expiration of his term of office, he obtained for himself, by the popular vote, the Province of Gallia Cisalpina and Illyricum for five years, to which the Senate added—to prevent the popular assembly from doing so—the Province of Gallia Transalpina. Nothing could have been more favorable to Cæsar's aims. He had now an opportunity of developing his extraordinary military genius, and of gathering round him an army of veterans, whom perpetual victory should inspire with thorough soldierly fidelity and devotion to his person. This was the very thing he wanted to give him a reputation equal to that of his coadjutors, Pompeius and Crassus, whom, in genius, he far surpassed. Leaving, therefore, the political factions at Rome to exhaust themselves in petty strifes, Cæsar, in B.C. 58, after the banishment of Cicero, repaired to his provinces, and during the next nine years conducted those splendid campaigns in Gaul by which, had he done nothing else, he would have "built himself an everlasting name." Cæsar's first campaign was against the Helvetii, who were migrating from Switzerland into Gaul, and whom he totally defeated near Bibracte (Mont-Beuvray, near Autun). Out of 368,000 men, women, and children, only 110,000 remained. These were commanded by Cæsar to return home and cultivate their lands. The eyes of the Gauls were now turned upon the new conqueror, whose aid was solicited against an invader from beyond the Rhine, the German chief Ariovistus. Cæsar advanced against Ariovistus, who was utterly overthrown. And now Cæsar, having in the course of one campaign successfully concluded two important wars, led his troops into winter quarters.

Next year (B.C. 57) occurred the Belgic War, in which Cæsar successively routed the Suessiones,

Bellovaci, Ambiani, and Nervii, who, alarmed at the progress of the Roman arms, had entered into an alliance with each other against the invaders. When the Senate received Cæsar's official dispatches, it decreed a thanksgiving of fifteen days—an honor never previously granted to any other general. During the winter and the spring following, Cæsar stayed at Lucca; and, after spending large sums of money in hospitality and for other less praiseworthy purposes, he departed for Gaul, where the flames of war had burst out in the northwest. The Veneti, a maritime people of Brittany, who possessed fleets of large vessels, were the chief instigators of the insurrection. Cæsar's plans were laid with consummate skill, and were crowned with the most splendid success. The Veneti were totally defeated, and most of the other Gallic tribes were either checked or subdued. Cæsar wintered in the country of the Aulerci and Lexovii (Normandy), having, in the course of three campaigns, conquered Gaul. Next year (B.C. 55) Crassus went to the East (where he was slain by the Parthians in B.C. 53), and Pompeius to Spain, while Cæsar's provincial government was prolonged for five years. He now undertook a fourth campaign against two German tribes who were about to enter Gaul. He was again successful; and, pursuing the fleeing enemy across the Rhine, which he had bridged, spent eighteen days in plundering the district inhabited by the Sigambri. He next invaded Britain, about the autumn; but after a brief stay in the island returned to Gaul. The Roman Senate, astonished at his hardihood and his successes in regions where no Roman army had ever been before, accorded him a public thanksgiving of twenty days. In B.C. 54 Cæsar opened his fifth campaign by a second invasion of Britain. On his return to Gaul, he was compelled—on account of the scarcity of corn, arising from drought—to winter his army in divisions. This naturally aroused the hopes of the Gauls, who thought the time had come for recovering their independence. An insurrection broke out in the northeast of Gaul, which was at first partially successful, but was ultimately crushed. Cæsar resolved to winter at Samarobriua (Amiens), in the vicinity of the malcontents. In B.C. 53 he commenced his sixth campaign. It was chiefly occupied in crushing a second insurrection of the Gauls.

Cæsar then returned to northern Italy, that he might be able to communicate more easily and securely with his friends in Rome. That city was gradually becoming more anarchic, the evils of weak government more apparent; the hour for decisive action seemed to be approaching, and doubtless Cæsar's heart beat with expectation of the mighty future reserved for his boundless ambition, when all at once the prospect was darkened by a tremendous rebellion extending over the whole of Gaul, headed by a young warrior named Vercingetorix. It was in the dead of winter when the news came to Cæsar, who instantly saw that, at all hazards, he must preserve his fame and his army. Leaving, therefore, his rival Pompeius to succeed at Rome, he hurried to meet the insurgent hordes. His great difficulty was to collect his scattered legions. First crossing, with some Cisalpine and provincial troops, the mountains of Auvergne, though they lay six feet deep in snow, he suddenly appeared among

the Arverni, who, terrified at his unexpected approach, sent for their chief, Vercingetorix, to come to their assistance. This was precisely what Cæsar wished. After some wonderful exhibitions of military skill and numerous successes by the Romans, Vercingetorix was shut up in Alesia (Alise in Burgundy), with all his infantry. Cæsar besieged him, and though harassed by nearly 300,000 Gauls without, who attempted but in vain, to break through the well-defended Roman lines, he forced Vercingetorix to capitulate. Many of the tribes now hastened to submit to Cæsar, who prudently determined to winter among the vanquished. The Senate voted him another public thanksgiving. In the next year (B.C. 51) Cæsar proceeded to quell the tribes who still held out. This he successfully accomplished, and having, in addition, reduced the whole of Aquitania, passed the winter of his eighth campaign at Nemetocenna, in Belgium, where he spent the time in a manner both politic and magnanimous. The Gallic princes were courteously and generously treated; the common people were spared the imposition of further taxes; and everything was done to render it possible for him to visit Italy with safety in the spring. This he did, and took up his residence at Ravenna, where he was informed of everything that was going on by the tribune C. Curio. There can be no doubt that at this moment he was the most popular man in the State, while his soldiery were devoted to him with a loyalty as enthusiastic as that which Bonaparte inspired when fresh from his Italian victories.

Meanwhile, Pompeius, whose vanity could not endure the greatness of Cæsar, had been gradually inclining again to the aristocracy, whose dread of the new conqueror was hourly increasing. After much futile diplomatic *finesse* on all sides, the Senate carried a motion "that Cæsar should disband his army by a certain day; and that if he did not do so he should be regarded as an enemy of the State." The tribunes Marcus Antonius and Q. Cassius put their veto on this motion; but they were violently driven out of the Senate chamber, and, fearing for their lives, they fled to Cæsar's camp. The Senate, in the madness of their terror, now declared war, and intrusted the conduct of it to Pompeius, whose pride in the invincibility of his military prowess hindered him from taking the necessary measures for the defense of the State. He fancied that his name would bring thousands to his standard, and he was even led to believe that Cæsar's troops were willing to desert their general; the result of which delusion was that when hostilities formally commenced, he had hardly any soldiers except two legions which had recently been in the service of his rival. Cæsar, on the other hand, perceiving that the time for decisive action had at length come, harangued his victorious troops, who were willing to follow him anywhere; crossed the Rubicon (a small stream which separated his province from Italy proper), and moved swiftly, amid the acclamations of the people, toward Rome. Pompeius fled to Brundisium, pursued by Cæsar, but contrived to reach Greece in safety, March 17, B.C. 49. The Italian cities had everywhere gladly opened their gates to the conqueror as a deliverer. Within three months Cæsar was master of all Italy.

CAIUS JULIUS CAESAR
FROM THE BRONZE BUST IN THE BERLIN MUSEUM

Cæsar next subdued Pompeius's legates in Spain, who were at the head of considerable forces. On his return he took Massilia (Marseilles), where he learned that he had been appointed dictator of the Republic—a function which at this time he retained for only eleven days; but these were honorably distinguished by the passing of several humane enactments. Pompeius, now thoroughly alive to the magnitude of his danger, had gathered a powerful army in Egypt, Greece, and the East, while his fleet swept the sea. Cæsar, however, crossing the Adriatic at an unexpected season, hastened to Dyrrhachium, where Pompeius's stores were; but was nevertheless outstripped by his opponent. Pompeius intrenched his army upon some high ground near the city, where he was besieged by Cæsar. The first encounter was favorable to Pompeius, who drove back Cæsar's legions with much loss. The latter now retreated to Thessaly, followed by his exulting enemies. A second battle ensued on the plains of Pharsalia, August 9, B.C. 48. Pompeius's army was utterly routed and Pompeius himself fled to Egypt, where he was treacherously murdered. See POMPEIUS.

No sooner had the news reached Rome than Cæsar was again appointed dictator for one year, and consul for five years. He was invested with tribunitial power for life, and with the right of holding all the magisterial comitia except those for the election of the plebeian tribunes. He did not, however, return to Rome after the battle of Pharsalia, but went to Egypt, then in a distracted condition on account of the disputes regarding the succession. Out of love for Cleopatra (who subsequently bore him a son), he entered upon the 'Alexandrine War,' in which he was successful, and which he brought to a close in March, B.C. 47. He next overthrew Pharnaces, King of Bosphorus, son of Mithridates, near Zela, in Pontus, August 2d of the same year, and arrived in Rome in September. He was once more appointed dictator, and the property of Pompeius was confiscated and sold. Before the close of the year he had set out for Africa, where his campaign against the Pompeian generals, Scipio and Cato, was crowned with victory at the battle of Thapsus, August 6, B.C. 46. Cato committed suicide at Utica; and with such irresistible celerity was the work of subjugation carried on, that by the end of the summer Cæsar was again in Rome. Now occurred that display of noble and wise generosity which proves Cæsar to have been possessed of a great, magnanimous nature. He was not a man that could stoop to the vulgar atrocities of Marius or Sulla, and so he majestically declared that henceforth he had no enemies, and that he would make no difference between Pompeians and Cæsarians. His victories in Gaul, Egypt, Pontus, and Africa were celebrated by four great triumphs, during which the whole Roman populace was feasted and feted by the magnificent liberality of the dictator.

He now proceeded to check, by wholesale enactments, as far as in him lay, the social evils which had long flourished in the city. During the year B.C. 46, also, he conferred a benefit on Rome and on the world by the reformation of the calendar, which had been greatly abused by the Pontifical College for political purposes.

VOL. III.—46.

In the meanwhile Pompeius's sons, Gneius and Sextus, were in arms in Spain. Cæsar overwhelmed their forces at Munda (B.C. 45). He now received the title of 'Father of his Country,' and also of *imperator*; was made dictator and *præfectus morum* for life, and consul for ten years; his person was declared sacred, and even divine; he obtained a bodyguard of knights and senators; his statue was placed in the temples; his portrait was struck on coins; the month Quintilis was called Julius in his honor; and on all public occasions he was permitted to wear the triumphal robe. He now proposed to make a digest of the whole Roman law for public use; to found libraries for the same purpose; to drain the Pontine marshes; to enlarge the harbor of Ostia; to dig a canal through the Isthmus of Corinth; and to quell the inroads of the barbarians on the eastern frontiers. But in the midst of these vast designs he was cut off by assassination, on the Ides (15th) of March, B.C. 44. The details of this crime—the greatest disaster that could have befallen the Roman world, as subsequent events made plain—are too familiar to require narration. It is sufficient to say that of the sixty aristocrats who were in the conspiracy, many had partaken of Cæsar's generosity, and all of his clemency. A few, like Brutus, out of a weak and formal conscientiousness, based on theory rather than insight, were probably shocked by Cæsar's desire to change the form of government into an hereditary monarchy; but most of them, like Cassius, were inspired by a jealous hatred of the dictator, and the base ambition of regaining power at all hazards.

Cæsar, who was 56 years of age when he was murdered, was of a noble and kingly presence, tall of stature, and possessing a countenance which, though pale and thin with thought, was always animated by the light of his black eyes. He was bald-headed (at least, in the latter part of his life), wore no beard; and though of a rather delicate constitution naturally, he ultimately attained to the most vigorous health. His besetting sin was sensuality; but without meaning to detract from the criminality of his conduct in this respect, it may be said that it was as much the sin of the times in which he lived as his own, and that the superlative grandeur of his position gave a prominence to his licentiousness which a more humble lot would have escaped. His intellect was marvelously versatile. In everything he excelled. He was not only the first general and statesman of his age, but he was—excepting Cicero—its greatest orator. As an historian he has never been surpassed, and rarely equaled in simplicity and vigor of style, and in the truthfulness with which he narrates events of which he was an eye-witness. He was, moreover, a mathematician, philologist, jurist, and architect, and always took great pleasure in literary society. Most of his writings have been lost, though their titles are preserved; yet we still possess his invaluable *Commentarii* (generally known as "Cæsar's Commentaries on the Gallic and Civil Wars"). The *editio princeps* was printed at Rome (1449). The best edition of his works is that of Dinter (Leipzig, 1890). Cæsar's life was formally written in ancient times by Suetonius and Plutarch. Consult, also: Delorme, *Cæsar et ses Contemporains*, etc. (Paris, 1868); Napoleon III., *Histoire de Jules*

Cæsar (Paris, 1865-66); Stoffel, id., *La Guerre civile* (Paris, 1888); Froude, *Cæsar* (London, 1879); Dodge, "Cæsar," in *Great Captains Series* (Boston, 1892); and Fowler, *Julius Cæsar and the Foundation of the Roman Imperial System* (New York, 1892). On the Gallic campaigns, consult Holmes, *Cæsar's Conquest of Gaul* (London, 1899).

CÆSAR, GARDENS OF. A tract on the southern slope of the Janiculum at Rome, laid out by Julius Cæsar in terraces supported by colonnades, with artificial glens and waterfalls. The site commanded an extended view. No remains above ground are now extant, but the spot has yielded a number of important works of art. The gardens were given to the people by Cæsar's will.

CÆSARE'A IN CAPPADOCIA, kâp'pâ-dô'shl-â. See KAISARIEH.

CÆSARE'A (Gk. *Καϊσάρεια*, *Kaisareia*) **PAL'ESTINE**. An ancient seacoast town of Palestine, on the site of which is the modern El-Kaisariyeh, 32 miles north of Jaffa (Map: Palestine, A 2). It was built by Herod the Great and named in honor of Augustus Cæsar. The site was originally called Strato's Tower. Herod made here a magnificent harbor by constructing a strong breakwater (the ruins of which still remain) on which he lavished vast sums of money. The town was built at great expense, with an amphitheatre, temples, and other like structures (Josephus, Ant. xv. 3-5; 9-6; xvi. 5-1). Its water-supply and drainage system were of unusual excellence. It became the military capital of Palestine, where the Roman procurators had their headquarters. It is noted in New Testament history as the place where Peter preached the Gospel to Cornelius, the first Gentile convert to Christianity (Acts x.), and as the scene of Paul's two years' imprisonment (Acts xxiii. 33, xxvi. 32). In the great war with Rome, A.D. 66-70, Cæsarea suffered the almost total extermination of its Jewish inhabitants. Here Vespasian had his headquarters and was proclaimed Emperor, A.D. 69. Soon after he constituted it a Roman colony. After the fall of Jerusalem (A.D. 70) it became the metropolis of Palestine. During the early Christian centuries Cæsarea continued to be a place of importance. Pamphilus, pupil and friend of Origen, had here a famous library (Third Century). Eusebius, the father of Church history, was Bishop of the place 315-318. The town was conquered by the Moslems in the Seventh Century. The Crusaders captured and plundered it in 1101. Among the booty they found, it was claimed, the Holy Grail (q.v.). After various fortunes at the hands of the Crusaders, who rebuilt it on a smaller scale, it was finally destroyed by the Sultan Bibars in 1265. The modern place is only a village on the ancient site.

CÆSAREA PHILIPPI. An ancient town of Palestine, near the foot of the southern slope of Mount Hermon. On its site is the modern village of Banias, formerly Paneas. Close by the place is a cavern whence issues one of the main sources of the river Jordan. In the Greek period this spring was consecrated to the god Pan. About B.C. 20 the Emperor Augustus gave this region to Herod the Great, who built a beautiful temple of white stone near the old Greek sanctuary, dedicating it to Augustus. On Herod's death the place became a part of the

tetrarchy of his son Philip, who built here a town, calling it Cæsarea. It became known as the Cæsarea of Philip (Cæsarea Philippi) Josephus, Ant. xv. 10-3, xviii. 2-1; Wars of the Jews, i. 21-3, ii. 9-1). Jesus visited the neighborhood for a short period of rest, at which time he more fully disclosed his Messiahship to the disciples (Matt. xvi. 13ff. and parallels). The name of the town was later changed to Neronias in honor of Nero. But the old name Paneas persisted, and outlived the others, since the modern Banias is but a corruption of Paneas.

CÆSAREAN (sê-zâ'rê-an), or **CÆSARIAN, OPERATION** (Lat. p.p. *cæsus*, from *cædere*, to cut. Popularly, but in all likelihood erroneously, connected with *cæsar*). A name which has from very ancient times been applied to the operation of delivering a child through an abdominal incision into the pregnant uterus instead of by way of the natural passages. The operation is of very ancient date. It is supposed to have been practiced by the Greeks, and Pliny mentions that Scipio Africanus and Manlius were born in this way. Children delivered in this manner were known as Cæsones, and from this the name Cæsar was subsequently derived as a family name.

A number of noted persons in history have had their names associated with the operation, as Esculapius, Julius Cæsar, and Edward VI. of England. In the case of the latter two, however, there seems to be very good evidence that birth was not accomplished in this manner.

There can be no question, however, that the operation was frequently practiced, and its performance was from time to time made a matter of statutory enforcement. Numa Pompilius decreed that every pregnant woman who died should be opened, and the Senate of Venice in 1608 decreed that practitioners should perform the operation, under heavy penalties, on pregnant women supposed to be dead. In 1749 the King of Sicily imposed the punishment of death upon a medical man who neglected to operate on a dying woman advanced in pregnancy.

During these earlier days in the history of the operation it seems to have been practiced almost solely upon women just dead or at the point of death, and to have had for its purpose the saving of the infant alone. The first case in which the operation was performed on a living woman occurred in 1491. Since this date many cases have from time to time been reported of both mother and child having survived the operation, and some of these under the most adverse circumstances. It is only since 1890, however, that the operation has come to take its place as a well-recognized surgical procedure in certain cases where delivery is impossible by natural means.

In brief, the operation is performed by making a vertical incision six or seven inches long in the mid-line of the abdomen over the pregnant uterus. When the uterus is exposed it is drawn into the wound, incised from above downward, and the child and placenta rapidly removed. After this the incision in the uterus is carefully closed by sutures, and it is allowed to fall back into its place. The abdominal wall is then brought together after the usual methods of suture and a suitable dressing applied. A very small death-rate attends the operation as at present practiced.

A modification of the Cæsarean operation, known as Porro's operation, removes the uterus after it is freed of its contents, thus obviating any possibility of a future pregnancy. Consult Kelly, *Operative Gynaecology* (New York, 1898).

CÆSAR IN EGYPT. A tragedy by Colley Cibber, produced at Drury Lane in 1724, and published in octavo in the following year. Its sources are Beaumont and Fletcher's *False One* and Corneille's *Mort de Pompée*.

CÆSARIO, sê-zâ'ri-ô. In Shakespeare's *Twelfth Night*, the name under which Viola, in the disguise of a page, enters the service of Orsino.

CÆSARISM. A term applied to that form of absolute rule in which the functions of government are exercised by a single person in whom they have, presumably, been vested by the will of the people. Such a despotism was that of Julius Cæsar, resting on a basis of popularity purchased by the free distribution of bread and gratuitous admittance to the gladiatorial shows, or that of the two Napoleons with its recourse to pliable plebiscites.

CÆSARIUS, SAINT OF ARLES. A bishop of the Sixth Century. He was educated in the monastery of Lérins, was appointed in 502 to the episcopal chair of Arles, and introduced into his bishopric many needed reforms. His *Regula Duæ* were much used by the founders of orders, previous to the general adoption of the Rule of Benedict. In 529, at the synod of Arausio (now Orange), he defended the Augustinian doctrines against the Semipelagians.

CÆSARIUS OF HEISTERBACH, his'têr-bâg. A German preacher and historian of the Thirteenth Century. He became a Cistercian friar in the monastery of Heisterbach, and died as prior there. He wrote *De Miraculis et Visionibus sui Temporis* (Cologne, 1591); *Homilia* (ib. 1615); and other works. Consult Kaufmann, *Cæsarius von Heisterbach* (Cologne, 1850).

CÆSARIUS OF NAZIANZUS (? -368). A Christian scholar and writer of the Fourth Century. He was educated at Alexandria, went thence to Constantinople, where many dignities were conferred upon him, and was distinguished for his knowledge of mathematics and physics. He is credited with four dialogues in the Latin editions of Saint Gregory, as also in the *Bibliotheca Patrum*; and Suidas says he wrote a work entitled *Contra Gentes*.

CÆSARODUNUM (*Cæsar* + *Gadhel dun*, stronghold, fort, AS. *dûn*, Engl. *down*, Latinized *dunum*). The ancient name of Tours, meaning 'Cæsar's Fort.'

CÆSARS, THE CITY OF THE. A legendary city of South America sought by many explorers of the Sixteenth and Seventeenth centuries. It is generally supposed to have been built by a member of the party of Sebastian Cabot, Cæsar by name, on the eastern slope of the Andes, near the middle western border of Argentina, in the second quarter of the Sixteenth Century. Another legend holds that it was founded by a shipwrecked Spanish crew, in the same locality and time.

CÆSAR'S HOUSEHOLD (Lat. *familia Cæsaris*, Gk. *ἡ Καίσαρος οἰκία*, *hê Kaisaros oikia*). A phrase used in the Epistle to the Philippians (iv. 22, "All the saints salute you, especially they

that are of Cæsar's household"). In its later and more developed usage, it referred to the Imperial household as embracing, not merely the immediate servants of the palace, but the whole list of the Emperor's attendants, amounting to a considerable portion of the city's population, and including in its number persons of rank, as well as freedmen and slaves. At the time when Philippians was written, however, the usage of the phrase was restricted, and denoted merely the direct servants and dependents of the Imperial establishment, who were exclusively slaves or freedmen.

The purely incidental character of the reference in the Epistle indicates that these members of the Emperor's household were known to parties in the Church at Philippi, being perhaps originally from that neighborhood in the East. If, therefore, as there is every reason to suppose, this Epistle, as the first of Paul's captivity letters, was written early in his imprisonment, these Imperial servants were in all probability brought into the Church before Paul's arrival in Rome, having possibly learned the Gospel in Philippi itself. At all events, they were more likely of Grecian than of Latin origin, Greeks and Orientals being especially numerous in Nero's household. The names of some of the Imperial attendants of this period, as recovered from the columbaria, occur in the list of salutations in Rom. xvi. Consult: J. B. Lightfoot, *Commentary on Philippians*, 7th ed. (London, 1883); Th. Zahn, *Einleitung in das neue Testament*, Vol. I., 2d ed. (Leipzig, 1900).

CÆSIUM, sê'zi-ûm (Lat. *cæsius*, bluish-gray). A chemical element discovered spectroscopically, in 1860, by Bunsen and Kirchhoff. It is found, in very small quantities, in certain mineral waters and in a number of minerals, including lepidolite, petalite, and certain feldspars. The only mineral which contains considerable quantities of it is the rare mineral pollux, found on the Isle of Elba, this mineral containing as much as 34 per cent. of caesium oxide. The preparation of metallic caesium involves the complete separation of its compounds from those of the other elements (iron, aluminium, the alkaline earths, and especially potassium and rubidium) that may be present in the given source; further, the transformation of the pure caesium compound obtained into the cyanide, and, finally, the electrolytic decomposition of the cyanide. The pure metal is very similar to potassium, and has a great avidity for oxygen, readily taking fire if exposed to the air. It is white, with a metallic lustre, has a specific gravity of 1.88, and melts at 27° C. (80.6° F.). Its chemical symbol is Cs; its atomic weight, 132.9. Its spectrum shows two characteristic lines in the blue part.

CAETANI, kâ't-tâ'nê, MICHELANGELO, Duke of Sermoneta (1804-82). An Italian student of Dante, born in Rome. He was best known for his commentaries on the *Divina Commedia*, including *Della dottrina che si asconde nell' ottavo e nono canto dell' Inferno* (1852); *La materia della Divina Commedia* (1865); and *Tre chiose nella Divina Commedia* (1876).

CÄF, käf, KÄF (or more properly, QAF). The mountain, or range of mountains, which in Arabic and Persian fiction surrounds the earth. The pivot on which the mountain rests is a great emerald from which the sky receives its colors,

and the mountain is the dwelling-place of giants and genii. 'From Kaf to Kaf' signifies from one end of the world to the other. The name Kaf is sometimes applied also to the Caucasus range.

Café PROCOPE, ká'fá' prô'kôp'. See PROCOPE CAFÉ.

CAFFA, káf'fá. See KAFFA.

CAFFARELLI, káf'fá-rél'lé, GAETANO MAJORANO (1703-83). An Italian vocalist who, when a boy, was deemed the first soprano of the age. He was highly successful for many years, having no rival, excepting, possibly, Farinelli.

CAFFEINE, káf-fé'in, **THEINE**, or **GUANINE**, gwá'rá-nín' (Brazil) (from Neo-Lat. *caffea*, coffee), $C_8H_{10}N_4O_2 + H_2O$. An alkaloid found in tea, coffee, and other vegetable products. It is a solid substance, crystallizing in long, flexible, colorless needles, which melt at $225^\circ C$. It combines with the strong mineral acids to form salts, such as the hydrochloride of caffeine—which are, however, very unstable. Pure caffeine is odorless, has a bitter taste, and is permanent in the air. If its solution in chlorine water is evaporated to dryness and the remaining residue redissolved in dilute ammonia water, a beautiful violet-red coloration is obtained. By this reaction the presence of caffeine may be detected in samples submitted for examination. Caffeine may be extracted from the tea by treatment with hot water and the subsequent addition of lime; the mixture thus obtained is evaporated to dryness, and the caffeine is dissolved out of the residue by chloroform. It may be prepared from coffee by the following process. The coffee is extracted with water; the solution is precipitated with lead acetate and filtered; sulphuretted hydrogen is passed into the filtrate to eliminate the excess of lead acetate added; the solution is then rendered more concentrated by evaporation and is neutralized with ammonia; on cooling, crystals of caffeine separate out, which may be purified by recrystallization from water. The amount of caffeine found in tea and coffee varies with the product—coffee usually contains less than 1 per cent., while amounts varying between 2 and 4 per cent. have been found in different samples of tea. The alkaloid is supposed to exist in these products in combination with tannic acid and potassium. Caffeine has absolutely no nutritive value. If taken in moderate quantities, it has the effect of increasing the blood-pressure and of stimulating the cerebrum, thus increasing the reasoning power and the imagination; it is even believed to increase the powers of muscular endurance. Larger quantities, however, are liable to cause trembling of the muscles, and toxic doses have the effect of paralyzing the heart. The symptoms of caffeine-poisoning are buzzing in the ears, flashes of light, a heavy feeling in the head, restlessness, insomnia, a rapid and feeble pulse, coldness of surface, and rise of central temperature. Even moderate quantities of tea and coffee are in some persons liable to cause irregularity of the heart. Therapeutically caffeine is used to combat certain forms of nervous and cardiac depression, certain headaches and neuralgias, gout, the insomnia of alcoholism, and opium narcosis. It is also used as a diuretic. Caffeine was discovered in coffee in 1820 and in tea in 1827 (theine); in 1838 Jobst proved the identity of caffeine and theine, and in recent years Emil Fischer succeeded in producing the sub-

stance artificially. Fischer determined the chemical constitution of caffeine, and showed that it is closely allied to uric acid, as well as to the alkaloid theobromine.

CAFFER BREAD. See KAFFIR BREAD.

CAFFRA'RIA. See KAFFRARIA.

CAFFRE CAT. See CAT.

CAFFRISTAN, káf'fré-stán'. See KAFFRISTAN.

CAFFI, káf'fá, **IPPOLITO** (1814-66). An Italian painter. He was born at Belluno, and studied in Venice. He painted many classical scenes and numerous fine frescoes. He met his death on the battle-ship *Re d'Italia* during the naval engagement off Lissa, July 20, 1866, in which he had participated in order to prepare a picture of the conflict. He excelled in the production of peculiar light-effects, and in his admirable management of perspective. His principal paintings are the following: "Carnival Scene on the Piazzetta, Venice" (1855), "Panorama of Rome," "Isthmus of Suez."

CAFFYN, KATHLEEN MANNINGTON (? -). An English novelist, born at Waterloo House, in Tipperary, Ireland. She was trained to become a nurse, married Mannington Caffyn, a surgeon, and author of the popular novel *Miss Milne and I* (1889), with whom she went out to Sydney, Australia. After her husband's death she took up novel-writing under the pen-name Iota. She became widely known by *A Yellow Aster* (1894), a problem novel, which has been followed by *Children of Circumstances* (1894); *A Comedy in Spasms* (1895); *A Quaker Grandmother* (1896); *Poor Max* (1898); *Anne Mauleverer* (1899); *The Minx* (1900); and *The Happiness of Jill* (1901).

CAGAYANE, ká'gá-yá'ná. A Malayan people on the Rio de Cagayan, northeastern Luzon. Their speech is Ibanag. See PHILIPPINES.

CAGE-BIRDS. The practice of keeping birds in captivity for the enjoyment of their songs, or for entertainment from their habits, or for admiration of their beauty, dates back so far that we have no knowledge of its origin. It existed among the nations of Asia before the time of Alexander, and it is said that elaborate bird-cages of ivory and gold were among the extravagances of Rome. When the islands of the Pacific Ocean were first visited, parrots were found captive among nearly all the tribes, and the natives of tropical countries generally capture and keep birds alive about their dwellings. In civilized countries at the present time, great numbers of birds are so kept, and thousands are annually imported into America in addition to many native favorites. Birds are captured for the market both by means of nets and with birdlime, but more commonly the young are taken from the nest and artificially reared. Many cage-birds, however, breed well in captivity, and such species are often reared in great numbers. A notable instance of this is the common canary, which, although a native of the Canary Islands, is bred in Europe, especially in the Harz Mountains, where the raising of fine canary songsters is an important cottage industry. The bird has become considerably modified under these conditions, and those reared for cage purposes differ markedly from the wild individuals in their native islands. The question of the ethics of

TYPICAL CAGE BIRDS

1. AMADAVAT (*Estrilda amandava*).
2. LINNET (*Acanthis cannabina*).
3. GOLDFINCH (*Carduelis carduelis*).

4. JAVA SPARROW (*Munia oryzivora*).
5. CHAFFINCH (*Fringilla coelebs*).
6. BULLFINCH (*Pyrrhula Europaea*).

keeping birds in captivity has recently been discussed not a little, but this is hardly the place to enter into the subject. Suffice it to say that the conditions under which the bird is kept, and its early history, profoundly modify the case. There can be no doubt that a canary bred in captivity, whose ancestors were captives, and which has never been at liberty, is far better off in a cage, if properly cared for, than if it were free, while it is equally true that to confine in a cage an adult bird, which has known the use of its wings and learned to get its own living, is wanton cruelty.

Cage-birds may be roughly classed as song-birds, talkers, and plumage-birds. Of song-birds, the canary is undoubtedly the most popular and best known, but the nightingale, bullfinch, goldfinch, and several European thrushes, the mocking-bird, cardinal-bird, and brown thrasher of North America, and the bulbuls and dhyals (magpie-robins) of India, are other widely known species whose beauty of song has brought them into captivity, not only in America, but in nearly all parts of the civilized world. Of the talkers the number of species is comparatively small, the best known being several species of parrot, the starling, and the mina-bird of India. The plumage-birds are legion, but are chiefly from the tropics, though a few are from warm-temperate regions, as the summer red-bird of the southern United States. The parakeets and love-birds, the painted finches, the cockatoos, and some large parrots and macaws are good examples of brilliant color, while the whydah-bird is one of those which are kept for some oddity of plumage. Birds differ greatly in their ability to stand captivity, especially when that involves a marked change of climate. Insectivorous birds are the most difficult to keep, not only because of the difficulty of furnishing sufficient food, but because under normal conditions the obtaining of their food requires great activity, and the sedentary life of a cage reacts unfavorably. Grain-eating birds are usually easily kept because the change in their lives is not so great. But it is not wholly a matter of food, for though parrots are easily supplied with food, many die in the early days of their captivity. Indeed, it is said that 95 percent. of the African gray parrots brought to Europe die before they have been taught to speak. With these birds, however, it is probably largely a matter of climate, the low temperatures, and especially the sudden and marked changes of temperature, proving too much for their tropical natures. In the United States it is better to purchase parrots in the spring and let them enjoy the natural heat of summer out of doors, guarding carefully against sudden changes. The best parrot for talking purposes is probably what is known as the double-fronted, yellow-faced Amazon, the *Chrysotis ochrocephala* of ornithologists. This is a South American species, but is hardy both in America and Europe. Parakeets and love-birds cannot be taught to speak, but their gentle habits and beautiful plumage make them great favorites. The cockatoos and great macaws are only with great difficulty taught to speak, and never make good talkers. They are noisy birds and disagreeable in other ways, but their great beauty induces many people to keep them.

Management.—In keeping any bird in captivity, it should be the constant endeavor to make

the surrounding conditions as natural as possible. When free, all birds are scrupulously clean; even the worst carrion-eaters keep themselves clean from dirt of every kind. Therefore cleanliness in the cage is one of the first matters to be attended to, and this is obviously of special importance when the attractive feature of the bird consists of remarkably developed plumes, like some of the tail-feathers of the whydah-bird. The cage should be large enough so that the bird may move about freely and change its positions easily without injuring its tail-feathers or any plumage ornaments. The perches should always be of soft, unpainted wood, and not too slender. The bird should have plenty of light, except at night; artificial light is almost certainly injurious, and cages in illuminated rooms should be veiled. The cage ought not to be in direct sunlight except in winter, and even then only for a comparatively short time. Water should be given a bird plentifully and ought to be always fresh. Most birds enjoy a bath, and opportunity should be frequently given for a bird to wash itself; the basin ought to have a dark interior, or gravel on the bottom, so that the bird may judge the depth of the water. After a bath the bird should be placed in the sun until dry. Occasionally, if possible, let the bird out of the cage and permit it to exercise in the larger freedom of a room or similar inclosure. Most birds need to be protected from sudden changes, draughts, and extremes of temperature, so that the cage ought not to hang near an open window or a door likely to be opened, except, perhaps, on still summer days; but fresh air is a prime necessity for most birds, and artificial heat, especially if very dry, is usually injurious. Owing to lack of exercise, by which they can be worn away, the nails and sometimes the bills of captive birds become so overgrown as to be a serious detriment to the health; therefore, opportunity for scratching ought to be provided in the shape of sand or heavy sandpaper, while for the bill a piece of cuttlefish-bone or some similar substance should be attached to the sides of the cage. Birds should never be unduly alarmed. Like all other animals, they deserve and will repay perfect kindness and gentleness in their treatment.

Food.—Most of the ailments of cage-birds come from an improper diet. The food may not be of the right sort, or it may be too scanty or too abundant. Few, if any, cage-birds are exclusively insectivorous, but even those which normally take much insect food also eat more or less vegetable matter. Insectivorous birds may be given meat when insect food is not abundant, and it is said that a diet of spiders is particularly good for such birds when they are not in perfect health. Nearly all cage-birds will eat seeds, and as a universal bird-food the seed of canary-grass is unequaled. It may be mixed with rape or hemp, and millet and even oats are sometimes used. Even parrots like canary-seed and are said to thrive on it. Seed-eating birds ought, however, to be given fresh vegetable matter sometimes, in the form of soft green leaves or fruit that is not acid. Such plants as chickweed and lettuce, put into the cage cool and fresh, are a valuable addition to the bird's diet. The greatest danger to birds is in overfeeding, underfeeding being very unusual. If a bird shows signs of ill health, it should, if possible, be placed

in a fresh cage, in new surroundings, given rather less food and that of the simplest kind. A drop of castor-oil placed in the bird's mouth by means of a brush often proves beneficial, but the chief reliance should be placed on changed surroundings, quiet, and a simple diet.

Avaries are outdoor inclosures in which birds are kept and reared in comparative freedom. They are common in the tropics and in England, but the harsher climate of the United States and other conditions have rendered them less popular here than is desirable. Aviaries, however, are really only large cages, and governed by similar rules. The breeding of cage-birds is a special department, instructions for which will be found in the books mentioned below. See **CANARY**; **PARROT**; **BULLFINCH**, and the names of various other cage-birds.

See **PLATE OF CAGE-BIRDS**.

CAGLI, kă'lyé (anciently, *Callium*, *Calles* of the Sabinians). An episcopal city in central Italy, in the Province of Pesaro e Urbino, on the Burano, 76 miles west of Ancona by rail (Map: Italy, G 4). The cathedral is beautiful, and the Church of San Domenico contains a Madonna and a Pietà by Giovanni Santi, Raphael's father. On a stream at the foot of the hill on which the town is built is an ancient bridge constructed of huge blocks of stone. There are silk-factories here. Population (commune), in 1881, 10,000; in 1901, 11,927.

CAGLIARI, kă-lyă'rê (anciently, Lat. *Cari-lia*). An archiepiscopal city of Italy, capital of the Province of Cagliari and of the island of Sardinia, at the southern end of which it is situated. It is on the slope of a steep hill 300 feet high which overlooks the Gulf of Cagliari, and is partially surrounded by extensive lagoons utilized for the manufacture of salt. The old section of the town, called the Castello, still has its ancient gates, towers, and walls, and contains the principal public buildings and palaces of the nobility. There are thirty-eight churches besides the cathedral, which was completed in 1312 by the Pisans, and has been almost entirely modernized. Below the ancient amphitheatre, which faces the sea and most of the seats of which were hewn out of the living rock, are the botanical gardens, which contain remains of Roman reservoirs and subterranean water-courses. The extensive Necropolis has Punic and Roman tombs hewn out of the rock. A number of Roman private houses have also been excavated. The university, founded in 1596 by Philip III. of Spain, and remodeled in 1764 by Charles Emmanuel of Savoy, has about 250 students, a library of over 70,000 volumes, and excellent mineralogical, paleontological, and zoological collections, and in the antiquarian museum there is the most complete and interesting collection of Sardinian antiquities. Cagliari has a street railway, omnibuses, and diligences, is the railway centre of Sardinia, is connected with the mainland by submarine cable and by regular steamboat service to Genoa, and is the residence of a United States consular agent. There are three theatres, and of the numerous fes-

tivals that of Saint Ephisius (May 1-4), when peasants in picturesque costume conduct the body of the holy man from Cagliari to Nora, is the most famous. The principal manufactures are firearms, powder, cotton goods, hats, and a kind of sweet cake. Ship-building is carried on. The principal exports are grain, flax, wine, cheese, goatskins, and salt; the principal import is lumber. Population (commune), in 1881, 39,000; in 1901, 54,000. Cagliari was founded by the Phœnicians.

CAGLIARI, PAOLO. See **VERONESE, PAOLO**.

CAGLIOSTRO, kă-lyô'strô, **ALESSANDRO**, Count (1743-95). An Italian impostor, whose real name was Giuseppe Balsamo. He was born in Palermo, of poor parentage, June 2, 1743. When thirteen years old he ran away from a seminary where he had been placed, and was afterwards sent to a monastery at Cartagire. Here he became assistant to the apothecary of the monastery, and picked up that scanty knowledge of chemistry and medicine which, in an age at once skeptical and credulous, imposed upon so many respectable individuals. He left the monastery or was ejected, and for a time led 'the loosest life' in Palermo. When 26 years old, he found it highly advisable to leave his native place. In company with a certain sage named Althotas, Cagliostro is vaguely represented as traveling in Greece, Egypt, and Asia. In Venice he married a very beautiful woman named Lorenza Feliciani, who became a skillful accomplice in his schemes, and captivated many admirers, while Cagliostro swindled them. In Italy and Germany he posed as a physician, philosopher, alchemist, Freemason, and necromancer, and did a lively business in his 'elixir of immortal youth.' He was not so successful in Saint Petersburg at the Court of the shrewd Catharine II. From Saint Petersburg he went to Warsaw, where he grew rich on titled dupes in spite of being exposed. In 1780 he was in Strassburg, later in Paris, then in England, and in 1785 again in Paris, where he was lodged in the Bastille for his share in the affair of the Diamond Necklace (q.v.). His plausibility secured his liberation, and he went to England, but there and elsewhere he found little scope for the continued exercise of his peculiar talents, and he returned to Italy in 1789. He had established a spurious Egyptian Masonic rite, and his continuance in this work in Rome led to his condemnation by the Inquisition. His sentence of death was commuted to life imprisonment, and he died in 1795. His wife ended her days in a convent.

BIBLIOGRAPHY. In *Notes and Queries*, Fourth Series, Vol. X. (London, 1872), appeared a Cagliostro bibliography by William E. A. Axon, who had just written (1871) a series of papers on Cagliostro for the *Dublin University Magazine*. Consult: in Thomas Carlyle's *Miscellaneous Essays*, "Count Cagliostro;" also, *The Life of Count Cagliostro* (London, 1787); *The Life of Joseph Balsamo, Commonly Called Count Cagliostro*, etc. (London, 1791). Much spurious material has appeared concerning Cagliostro's life. Such are the so-called *Mémoires authentiques* (Paris, 1786).

CAGNACCI, kă-nyă'chê. See **CANLASSI**.

CAGNAT, kă-nyă', **RENÉ LOUIS VICTOR** (1852—). A French classical archaeologist, born in Paris. He was appointed professor of Roman

epigraphy and antiquities at the Collège de France in 1895, and is the author of *Etude historique sur les impôts indirects chez les Romains* (1882); *Explorations épigraphiques et archéologiques en Tunisie* (1883-86); *L'armée romaine d'Afrique* (1892); *Recherches et découvertes archéologiques dans l'Afrique du Nord* (1892); *Découvertes nouvelles en Tunisie* (1896); *Cours d'épigraphie latine*, 3d ed. (1898); and various other archaeological and epigraphical works.

CAGNOLA, ká-nyó'la, LUIGI, MARCHESE (1762-1833). An Italian architect. He was born in Milan of an ancient and wealthy family, and early devoted himself to architecture. His master works are two triumphal arches which he built at Milan by order of Napoleon. The first is the Porta di Marengo (later known as the Porta di Ticino), a work of great beauty, built of Alpine granite. The second is the famous Arco della Pace, begun in 1807, but not finished until 1838. It is constructed of white marble, and is one of the largest and noblest structures of the kind in Europe, reaching the height of 78 feet. On the top of the arch is a bronze figure of Peace, in a car drawn by six horses, while the sides are richly adorned with innumerable bas-reliefs. Besides these may be mentioned the Campanile at Ugnano and the chapel of Santa Marcellina in the basilica of Sant' Ambrogio, Milan.

CAGNONI, ká-nyó'né, ANTONIO (1828-96). An Italian composer, born at Godiasco, Voghera. He was a pupil of the Milan Conservatory, and afterwards became *maestro di cappella* at Vigevano. His works include much church music composed at this time, and about twenty operas of unequal merit, among them *Rosalía di San Miniato* (1845); *Il testamento di Figaro* (1848); and *Il vecchio della montagna* (1863).

CAGOT, ká'gó', also known as CAGOTS, CAQUEUX, COLLIERTS, etc. An alien or outcast people living chiefly in the Pyrenees of southern France and extreme northern Spain. Their origin is unknown. They have been thought to be descendants of the Visigoths, but are more probably autochthones concentrated in a sterile and rugged land by pressure from more progressive peoples without. Except that they are sedentary, their habits and customs are not unlike those of the gypsies (q.v.). Before the French Revolution they were regarded as Ishmaelites, and often treated as heretics or lepers, their relations with neighboring peoples affording a most notable example of the persistence of primitive race-sense into modern times. Cretinism, goitre, and various deformities and incapacities are exceptionally common among them; by some they are thought to be distinguished by the absence of the lower lobe of the ear; and these peculiarities have aided in holding contemporaries aloof from them. Since 1790 they have been recognized as citizens. Their language is a blend of neighboring tongues with a few peculiar terms and forms.

CAGSAUÁ, kág-sá'wá. A town of Luzon, Philippines, in the Province of Albay, situated two miles north of Albay. Population, in 1898, 20,450.

CAHABA, ká-hq'ba, or **CAHAWBA**. A river rising near Birmingham, in Jefferson County, Ala., flowing nearly south through a region rich in coal, and joining the Alabama River at Cahaba, 10 miles southwest of Selma (Map:

Alabama, B 3). Cahaba is navigable for small craft for nearly 100 miles.

CAHAN, ká'hán, ABRAHAM (1860—). A Russo-American author, born at Vilna (Russia). He was educated at the Vilna Teachers' Institute, and in 1882 came to the United States, where he was for a time editor of two Yiddish publications, a weekly paper and a monthly periodical. His works include *Yeke, a Tale of the New York Ghetto*, generally regarded as the most important fictional study of Jewish life in America, and another similar book, *The Chasm*.

CAHENS/LYISM. A name given to the plan proposed in 1892 by the German Catholic Bishop Cahensly, who advised that the foreign-born population of the United States should be divided, for ecclesiastical purposes, according to their European nationality, under priests speaking their own languages, and of like race. This plan, which would tend to perpetuate in this country the racial divisions of Europe, was vigorously and successfully opposed by Cardinal Gibbons, Archbishop Ireland, and other leaders of the 'American party' in the Roman Catholic Church.

CAHORS, ká'ór' (anciently, Lat. *Cadurcum*, from the Celtic tribe *Cadurci*; earlier *Divona*, 'the sacred source'). A town of France, capital of the Department of Lot, and seat of a bishopric, situated on a small, rocky peninsula, formed by a bend of the river Lot—here crossed by three bridges—about 60 miles north of Toulouse (Map: France, H 7). It consists of the upper and lower city, and among its antiquities are the fine Romanesque cathedral, the ruins of a Roman temple and aqueduct, and tower of the ancient royal palace (Fourteenth Century). There is also a monument of Fénélon, who studied at Cahors, also statues of Gambetta, who was born at Cahors, and of Clément Marot. Among the institutions are a library of 13,000 volumes, a girls' school, and a museum. It has manufactures of cotton-yarn, woollens, leather, paper, glass, etc.; the district produces a famous red wine which bears its name. Population, in 1896, 14,502.

CAIAPHAS, ká'yá-fas. A high priest of the Jews, appointed by the Roman procurator, Valerius Gratus, in the reign of Tiberius Cæsar, at the beginning of Christ's ministry. He was in office at the time of the trial and crucifixion of Jesus, but was removed by Vitellus A.D. 37 (Josephus, *Antiq.* xviii. 2, 2; 4, 3.) His wife was the daughter of Annas, a former high priest (A.D. 7-14). The chief priests were at this time largely Sadducees, and it is to be noted that in the trial of Jesus and subsequent persecution of the Apostles they were more prominent than the Pharisees. In a general council summoned to take action upon the spread of the doctrines of Jesus, Caiaphas was decidedly in favor of putting him to death, using this language: "Ye know nothing at all; nor do ye take account that it is expedient for you that one man should die for the people, and that the whole nation perish not." (John xi. 50; John says he 'prophesied,' verse 51; cf. xviii. 14.) Christ was arraigned in the court of the high priest, and when the effort to convict him through the testimony of witnesses who are designated by Matthew (xxvi. 60) and Mark (xiv. 56-57) as false, failed, the prisoner was called as a witness and asked if he was

indeed the Christ, Son of God. The answer being in the affirmative (Matt. xxvi. 64), the high priest pretended to be sorely grieved at what he considered blasphemy, and appealed to Christ's enemies to say if that was not enough. The answer was that Christ deserved death, and according to Matt. xxvii. 1, and John xviii. 28, the sentence was ratified at a formal meeting of the Sanhedrin on the following morning. The high priest, however, did not have the power of final condemnation, which rested with the Roman authorities, to whom Jesus was accordingly handed over. Later Caiaphas persecuted the followers of Jesus (Acts iv. 6, v. 17).

CAIBARIEN, kî-bâ'rê-ân'. A seaport on the northern coast of Cuba, in the province of Santa Clara. It has some coastwise trade and sponge-fisheries (Map: Cuba, F 4). Population, in 1899, 7013.

CAICOS (kî'kôs) **ISLANDS** (Sp. *cayo*, rock, shoal, islet in the sea). A group of small islands at the southeastern extremity of the Bahamas, lying between latitude 21° and 22° N., and longitude 71° and 72½° W. (Map: West Indies, M 4). Though geographically a portion of the Bahamas and formerly under the government of Bahama, they form with Turk Islands a separate government under the Governor of Jamaica. There are, including the Turk groups lying southeast, more than thirty small islands, having an area of less than 200 square miles, but only six are inhabited. The largest is Grand Caicos, which is 20 miles long by 6 broad. The seat of government is at Grand Turk. The chief industry is salt-raking, and a considerable amount of salt is exported annually to the United States, Canada, and Newfoundland. There is also a sponge-fishery. Population, about 5000.

CAIFA, kî'fa, or **HAIFA**, hî'fa. A seaport of Syria, on the Bay of Acre, lying upon a spur of Mount Carmel (Map: Palestine, A 2). Since the establishment of direct steam connection with Europe, and the completion of the railway line from Damascus, the little seaport has grown rapidly in commercial importance, and promises to be a strong rival of Acre, over which it has the advantage of a safe harbor. There are a number of missionary schools, and not far from the town is a settlement of German Templars, established there since 1869. Population, about 10,000, mostly Mohammedans.

CAILLETET, kâ'ye-tâ', **LOUIS PAUL** (1832—). A French chemist and ironmaster, born at Châtillon-sur-Seine. He studied at the School of Mines in order to engage in the iron industry in his native town. In addition to his business interests, he devoted himself to the study of chemistry and worked on original researches, paying especial attention to metallurgical investigations and the liquefaction of gases. In 1877 he succeeded in liquefying both oxygen and nitrogen. For this work he was honored by election to the Académie des Sciences, first (1877) as a corresponding member and then (1884) as a full member. In 1889 he was appointed an officer of the Legion of Honor. A few days after Cailletet's discovery Raoul Pictet (q.v.), a Swiss chemist, succeeded in obtaining the same result by another method.

CAILLIAUD, kâ'yô', **FRÉDÉRIC** (1787-1869). A French traveler. After visiting southern Europe, Asia Minor, and Egypt, he was engaged

by Mehemet Ali to explore the deserts along the Nile and near the Red Sea. On this voyage he discovered the emerald-mines of Mount Zabara. He returned to France with a valuable collection of antiquities, plants, and minerals, and published *Voyage à l'oasis de Thebes* (1821). He went again to Egypt and made explorations in 1821-22 in the eastern deserts, accompanying Ibrahim Pasha on his expedition of conquest to Sennar. Among the relics of antiquity brought by him to France and purchased by the Government was a mummy, inscribed with hieroglyphic characters accompanied by a Greek translation, which proved of great help to Champollion in the study of the ancient language. He published *Voyage à Meroé* (1826-27) and several other works on the antiquities and present customs of Egypt.

CAILLIE, kâ'yâ', **RENÉ** (1799-1838). A French traveler. He was born at Mauzé, Deux-Sèvres, and early in life became a traveler in Africa, supporting himself by trade with the Moors, from whom he learned Arabic. He dressed as an Arab and passed as an Egyptian. He penetrated as far as Timbuktu in 1828, and for this exploit received a prize of 10,000 francs from the Geographical Society of Paris, besides a pension of 1000 francs and admission to the Legion of Honor. His notes of travel, arranged by M. Jomard, were published under the title *Journal d'un voyage à Tombouctou et à Jenné dans l'Afrique centrale* (3 vols., 1830).

CAIMACAM, kâi'mâ-kâm', or **KAIMAKAM** (Turk. *qâimaqâm*, Ar. *qâ'im*, *maqâm*, literally, substitute from *qâ'im*, standing, scil. in another's + *maqâm*, place). A Turkish officer corresponding to lieutenant-colonel in the army, or lieutenant-governor in the civil service. The Caimacam of Constantinople is the lieutenant of the Grand Vizier, whom he represents in processions. Such officers also act as governors in the principal towns.

CAIMAN, kâ'man. See **CAYMAN**.

CAIN. According to biblical tradition, the first born of Adam and Eve. His story is given in Gen. iv., which belongs in substance to J in the modern distribution of the Pentateuchal sources. He tilled the soil and brought its fruits to God in sacrifice. When he found that his brother Abel's sacrifices of sheep were accepted, probably because made with love of God, as his were not, he became jealous of Abel, and slew him. The murderer was banished by the Almighty from the ancestral home, and on him was put some sign "lest any one finding him should smite him." He went with his wife to the land of Nod and there laid the foundation of the first city. The name Cain is explained in Gen. iv. 1 as meaning 'acquisition'; but others take it as 'spear,' or 'smith.' Canon Cheyne and others of the modern critical biblical school consider that Gen. iv. is composed of several stories relating to different Cains, and that one of them was the eponym of the Kenitos. Their story of this latter Cain was intended to explain the invincible Kenitish aversion to dwelling in cities, and preference for the nomad state, by linking the Kenite with the first wanderer.

Cain is alluded to in the New Testament as synonymous with a wicked man (Heb. xi. 4; I John iii. 12; Jude, verse 11).

CAIN: A MYSTERY. A tragedy by Lord Byron, begun at Ravenna, July 16, 1821, completed September 9, and published in December of the same year. It deals with the biblical tale of the fraternal jealousy, the temptation by Lucifer, and the final murder and expulsion from Eden. It is remarkable as an extremely ingenious appeal for sympathy with the title-character.

CAIN, ká'an', AUGUSTE NICOLAS (1822—). A French sculptor, born in Paris. He studied under Buonnet and Rude, and became well known for his depictions of animal life, in particular of large birds and beasts of prey. Among these may be cited, "Eagle Defending its Quarry" (1852); "Lion" (1874; Luxembourg Gardens); "Combat Between Two Tigers" (1878); "Rhinoceros Attacked by Tigers."

CAINE, THOMAS HENRY HALL (1853—). An English novelist and dramatist. He was born at Runcorn, Sheshire, of Manx descent, but now makes his home on the Isle of Man. Most of his books deal with Manx characters and subjects. He was an architect in early life, but became a journalist. During the last year of Rossetti's life, Mr. Caine lived with him, and in the same year (1882) published *Recollections of Rossetti*. Among his other publications are *The Shadow of a Crime* (1885); *The Deemster* (1887); *The Bondman* (1890); *The Scapegoat* (1891); *The Manxman* (1894); *The Christian* (1897); and *The Eternal City* (1901). Several of his novels have been dramatized. He visited Canada and the United States in 1895-96 to promote the international copyright movement.

ÇA IRA, sá é'rá' (Fr., it will go, equivalent to our 'it's all right'). A French Revolutionary song, the words by Ladre, a street singer, and the melody originally a popular *carillon* by Bécourt, and a favorite air of Marie Antoinette. The song is said to have been first sung when the mob marched to Versailles, October 5, 1789. At the beginning of the Revolution, when all France was wild over Liberty, Equality, and Fraternity, the song ran,

"Ah, ça ira, ça ira, ça ira.
Celui qui s'élève, on l'abalssera,
Celui qui s'abalssé, on l'élèvera;"

but later, when the fierce passions began to stir, came the refrain, *Les aristocrates à la lanterne*.

CAIRD, kârd, EDWARD (1835—). An English educator and philosophical writer. He was born in Scotland, and was educated at Glasgow and Oxford universities. He became professor of moral philosophy at Glasgow University in 1866, and succeeded Dr. Benjamin Jowett as master of Balliol College, Oxford, in 1893. His published works include *The Critical Philosophy of Immanuel Kant* (1889); *Essays on Literature and Philosophy* (1892); and *The Evolution of Religion* (1893).

CAIRD, JOHN (1820-98). A minister of the Established Church of Scotland, and one of the most eloquent preachers in Great Britain. He was born at Greenock, on the Clyde, December 15, 1820. He studied at the University of Glasgow, and in 1845 was ordained to the pastorate of the church of Newton-on-Ayr, whence in 1847 he was transferred to Lady Yester's, Edinburgh. Here his popularity was extraordinary, but the demands made on his physical energies were so great that he found it necessary to retire to the country, and accepted, in 1849, the country charge of

Errol, in Perthshire. A sermon which he preached before the Queen in 1855, in the Church of Crathie, and which was published, by royal command, under the title of *Religion in Common Life*, was universally admired throughout Great Britain, translated into German, and published on the Continent under the auspices of Chevalier Bunsen, who wrote a preface to it, and suddenly carried the fame of the author into all parts of the Protestant world. In 1857 Dr. Caird accepted a call to Park Church, Glasgow. In 1862 he was appointed professor of divinity, and in 1873 principal of Glasgow University. He published *Introduction to the Philosophy of Religion* (1880; 2d ed., 1900); *Spinoza* (1880); posthumously appeared, edited by his brother, E. Caird, *University Sermons* (1898); *University Addresses* (1898); *The Fundamental Ideas of Christianity* (with Memoir, 2 vols., 1899). He died at Greenock, July 30, 1898.

CAIRN, kârn (Gael. *carn*, heap of stones). In archaeology, a name applied to a heap of stones erected over a grave or over a body not otherwise buried, or as a landmark. Among advanced peoples cairns are commonly used to mark stations of exploration or survey; among primitive peoples a mystical meaning commonly attaches to such structures. Thus certain American tribes build cairns as divide-marks on their trails by carrying stones up-hill as symbols of the journey, and then casting them aside on the growing heap as tangible emblems of relief from the labor of ascent. See ARCHÆOLOGY.

CAIRNES, kârnz, JOHN ELLIOTT (1823-75). An Irish economist. He was born at Castle Bellingham, County Louth, December 26, 1823, and was educated at Trinity College, Dublin. He studied law, and was admitted to the Irish bar, but passed most of his time in writing for the press, chiefly upon economic questions affecting Ireland. In 1856 he was appointed professor of political economy in Dublin, and the next year his professorial lectures were published under the title *Character and Logical Method of Political Economy*. He next wrote for *Fraser's Magazine* a series of essays on the gold question, induced by the sudden increase of supply from California and Australia. In 1859 he was appointed professor of political economy and jurisprudence in Queen's College, Galway. In 1862 he published his work on *The Slave Power*, in which he warmly advocated the course of the Northern States, from the standpoint of the economist fully aware of the superiority of free to slave labor. His conclusions were to a large extent verified by the results of the war. In 1866 he was appointed professor of political economy in University College, London. From 1860 till his death, which occurred on July 8, 1875, he suffered greatly in health, and this of necessity restricted his powers of production; nevertheless this was the period in which he wrote his chief work, *Some Leading Principles in Political Economy, Newly Expounded* (1874). Though in the main an adherent of the school of J. S. Mill, Cairnes exhibited at all times an original genius and a capacity for rigid logical deduction which enabled him to restate many of the principles of Mill in a more tenable form. In respect to method, Cairnes treated political economy as almost a pure science, with little concern for the practical application of its principles. He wrote in defense of the Wage Fund

theory, after Mill, with whom it originated, had abandoned it. Among his other contributions to the science of economics may be mentioned his keen analysis of the subject of cost in production, and of value as affected by the limits of free competition.

CAIRNGORM, kàrn-gòrm'. A brown or yellow variety of quartz found in the District of Cairngorm, southwest of Banff, Scotland, whence its name. The color was formerly considered due to the presence of a small quantity of iron or manganese oxide, but it is now believed to be caused by some nitrogenous organic compound. Besides Scotland, cairngorm is found in Brazil, Siberia, Spain, and in the United States, near Pike's Peak, Colo., and in Burke and Alexander counties, N. C. The yellow variety is sometimes called 'false topaz' and 'Scotch topaz,' or 'Spanish topaz,' through its lacking the hardness and brilliancy of the true topaz. In Scotland the cairngorm is cut and used for making brooches, bracelets, pins, etc.

CAIRNS, kàrnz, HUGH MACCALMONT, Earl (1819-85). A British statesman, born at Cuttra, County Down, and educated at Trinity College, Dublin. He became a member of the House of Commons for Belfast in 1852, Solicitor-General under Lord Derby in 1858, Attorney-General in 1866, and Lord Justice of the Court of Appeals in the same year. In 1868 he was Lord High Chancellor in the Disraeli Ministry. Upon the return of the Conservative Party to power, in February, 1874, he was reinstated and continued to exercise his official functions until April, 1880. In 1878 he received the title of Viscount Garmoyle, in the county of Antrim, and Earl Cairns. He was one of the finest Parliamentary orators of recent times; and several of his speeches are justly regarded as masterpieces.

CAIRNS, JOHN (1818-92). A Scottish divine. He was born at Ayton, Berwickshire, and studied at the universities of Edinburgh (1834-41) and Berlin (1843-44), and at the Presbyterian Secession Hall from 1840 until licensed. He was minister of the United Presbyterian Church, Berwick-on-Tweed, from 1845 to 1876, when he removed to Edinburgh, where, in 1879, he was appointed principal of the Theological College. Among his published writings are the following: *Life of John Brown, D.D.* (1860); *Unbelief in the Eighteenth Century* (1881); the articles "Schottland" and "Kirchliche Statistik" in the second edition of Herzog's *Realencyklopädie*; and the article "Infidelity" in the *Schaff-Herzog Encyclopedia*.

CAIRO, kî'rô (from Ar. *Masr el-Qāhira*, the victorious capital). The capital of Egypt and the largest city of Africa. It is situated near the right bank of the Nile, about nine miles above its bifurcation into the Rosetta and Damietta arms, 150 miles southeast of Alexandria and 80 miles west of Suez (Map: Egypt, E 2). It covers an area of 11 square miles divided into separate quarters named after the nationality of the inhabitants, and is surrounded by a low wall. Notwithstanding modern improvements, the Arabian quarters retain their Oriental character, the streets in that part of Cairo being narrow, crooked, and but few of them paved. The houses are mostly of stone, several stories high, and with window-lattices of wrought iron. The modern portion of Cairo, called Ismailieh, is extend-

ing westward. It is lighted by gas, has electric tramways, and is well laid out with broad avenues, fine squares, and a beautiful park on the Place Ezbekieh, occupying an area of over twenty acres and containing a number of gardens and amusement places. The Place Ezbekieh is the centre of modern Cairo, and around it are situated the principal theatres, hotels, and consulates.

The chief beauty and interest of Cairo lie in its numerous mosques, of which some are regarded as the best specimens of Arabic architecture. The Gami-ibn-Tulun, erected about 879, is the finest. It is square and surmounted by four minarets and a dome, and has a court with a fountain in the centre. The Gami Amra is the oldest in Egypt, but only a small portion of it is left. The Gami Sultan Hassan was begun in 1356, and, in point of splendor, stands foremost among the mosques of Cairo. It is cruciform in the interior, and contains a large number of pillars and beautiful hanging lamps. Its inner court has two fountains of singular beauty, and its dome is flanked by two minarets, the southern of which is said to be the highest in Egypt. Among other mosques may be mentioned that of Mehemet Ali, a structure of considerable architectural merit, recently built after Turkish models, with high minarets of alabaster. The mosque of Kait Bey dates from the Fifteenth Century. Cairo has a number of tombs of califs and Mamelukes, some of which are of great size and finely built. The obelisks, once so numerous, have disappeared, and now adorn various European and American cities. The bazaars of Cairo are extensive and well stocked, although inferior to those of Constantinople or Smyrna. The chief business street, Muski, has greatly decreased in importance. The citadel of Cairo is situated southeast of the city, and affords a fine view; its strategical importance is greatly detracted from by the fact that it is dominated by the Jebel Mokattam.

As an educational centre Cairo ranks high: its schools are attended by students from all parts of the Islamic world. Among its educational institutions the El-Azhar stands foremost, both in size and importance. It is situated in an old mosque, and is surrounded by numerous smaller buildings, used for the accommodation of the 10,000 students, of whom about 2000 live in the college. Its history can be traced as far back as 975, and it is considered the oldest university in the world. It has faculties of theology and jurisprudence, and is maintained chiefly by endowments, no tuition fee being charged.

The other educational institutions include schools of art and medicine, a veterinary and a polytechnical school, besides numerous missionary and Arab schools. The vice-regal library contains about 50,000 volumes, including a number of very rare copies of the Koran.

Cairo is the residence of the Khedive, and is the seat of administration of Egypt. It has also an international court and consular representatives from all important countries. The manufactures of Cairo include metal articles, textiles, essences of flowers, etc. There is railway communication with Alexandria, Damietta, and Suez. The population of Cairo and its suburbs was 570,062 in 1897, consisting chiefly of Turks, with some Copts, Nubians, Berbers, Abyssinians, Jews, and over 20,000 foreigners.

Old Cairo or Fostat was founded in 640 by Amru, the conqueror of Egypt, on the site of his camp and near the old town of Babylon. It was the capital of the country till 973, when Gauhar, the general of the Fatimite Caliph Al Moez, founded to the north of Fostat the new town of Al Kahirah, the Victorious City; Saladin enlarged the boundaries of the town and surrounded it with walls. Throughout the Middle Ages Cairo was one of the chief centres of Mohammedan culture, and the emporium for the trade between Europe and the East. From 1798 to 1801 it was held by the French; it passed from them to the Turks, and through the Turks to Mehemet Ali, the founder of the present ruling dynasty. Though much of its former greatness has departed, Cairo is still one of the great capitals of Islam, and the life within its walls presents a picturesque blending of the buoyant European civilization, as represented by the English and French residents, with the dreamy mysticism of the Oriental world. Consult: Reynolds-Ball, *The City of the Caliphs* (Boston 1897); Penfield, *Present-Day Egypt* (New York, 1899); and Kemeid, *Cairo and Egypt* (London, 1899-1900).

CAIRO, kâ'rô. A city, port of entry, and county-seat of Alexander County, Ill., at the junction of the Mississippi and Ohio rivers, 160 miles southeast of Saint Louis, on the Illinois Central, Cleveland, Cincinnati, Chicago and Saint Louis, and other railroads (Map: Illinois, 1906). The Ohio River is here crossed by a railroad bridge 2 miles long, and 58 feet above high water, which cost \$2,500,000. Cairo has considerable manufactures, chiefly products of lumber, and has an extensive river trade, being an important market for the agricultural products of the Mississippi valley. It has a public library (A. B. Safford Memorial), a Government custom-house, and a United States marine hospital. Settled about 1837, Cairo was incorporated some 30 years later. It was expected to become a great commercial centre, and is the place described by Dickens in *Martin Chuzzlewit* as 'Eden'; but, until it was protected by levees, begun in 1857, it suffered from frequent inundations, the most disastrous of which occurred in 1858. During the Civil War large quantities of military supplies were stored here by the Federal Government. Cairo is governed under a general act of the State Legislature, passed 1872, with slight amendments since that time. The mayor, who is elected biennially, and the city council, chosen by wards, select the city marshal, tax collector, corporation counsel, health officers, policemen, etc. Other offices are filled by popular election. Population, in 1890, 10,324; in 1900, 12,566.

CAIROLI, kî'rô-lé, BENEDETTO (1825-89). An Italian statesman, born at Gropello, near Pavia. He was educated at the University of Pavia, which he left in 1848 to volunteer in the war against Austria, and from 1851 to 1859 lived in exile in Piedmont, when he again took up arms for Italian liberty, serving at the siege of Palermo, in the Trentino, and at Monterotondo and Mutino. Though he favored a republic, he was induced to accept the constitutional monarchy. After the accession of Humbert I. Cairoli became president of the Chamber, and was appointed Premier in March, 1878. This was the beginning of the period of personal and factional politics which have since been the bane of

Italy. On November 17, as the King was driving into Naples, a certain Giovanni Passanante attempted to assassinate him with a poniard, but was prevented by Cairoli, who was in the carriage, and who received a severe wound, while King Humbert escaped with a mere scratch. In December, 1878, the Cairoli Ministry resigned. The Depretis Ministry, which succeeded, was in turn defeated in 1879 and the Left again came into power, under Cairoli, who was, however, forced to reconstruct his Cabinet the same year, and to bring in Depretis as Minister of the Interior. Finally, owing to the unpopularity of the policy pursued in regard to the French expedition to Tunis, the Ministry resigned in 1881. From that time until his death Signor Cairoli was conspicuous as a leader of the so-called 'historic' Left. Consult Lowell, *Governments and Parties in Continental Europe* (Boston, 1897).

CAISSON, kâs'sôn (Fr., augment of *caisse*, chest, Eng. case). A four-wheeled vehicle or ammunition carriage, attached to batteries of field artillery. In horse or light field batteries

U. S. FIELD-ARTILLERY CAISSON.

there is usually one caisson to each gun, and in heavy field batteries two. The ammunition is carried in three chests, two of which are mounted on the body or caisson proper, and one on the limber. On the caisson are also carried a spare wheel and such tools and supplies as would be useful in any emergency or accident likely to cause delay. The limber of the caisson is similar to that provided for gun-carriages. See ARTILLERY; FIELD ARTILLERY; LIMBER.

CAISSON. A floating gate with both ends alike, and resembling a short but very deep vessel, which is used to close the entrance to a dry dock. Its framing and plating resemble those of a ship, and it frequently contains a boiler and pumps for clearing it of water after being submerged. The term is also used, in a nautical sense, to designate a hollow floating structure for lifting ships. Caissons for this purpose are now generally made of steel, and are divided into compartments which can be separately connected with a pump. To operate a caisson it is first submerged to the required point, and then, having little or no buoyancy, it is drawn under the vessel to be raised or, with others, lashed to her with chains or ropes. The water is then pumped out, and the ship rises, supported by the caissons. Sectional floating docks, not now much used, consist of several caissons which are linked together to form a bed long enough to support a ship. In New York and in one or two other ports there are contrivances for lifting vessels called *screw-docks*. These consist of caissons which are sunk sufficiently to permit the vessel to pass over them. They are then emptied, and after they have lifted the vessel as far as their buoyancy permits, the caisson and vessel are raised by heavy screws in a side framework.

The pneumatic caisson used in hydraulic engineering consists of a steel box without a lower side, but with sides and top air-tight. It rests on the bottom, into which the sharp edges of its sides are forced by pressure or weight. To further assist in keeping the water out, an adequate air-pressure is maintained in it. The men who work in the caisson enter through air-locks which have air-tight doors on each side, so that very little pressure is lost. See FOUNDATION, and DOCK.

CAISSON DISEASE. A rare affection induced by remaining for any length of time in a caisson. The disease was first described by Pol and Watelle, in 1845. The symptoms are buzzing and pain in the ears, dizziness, loss of power in the legs, severe pain in the arms, legs, and shoulders, bleeding from the nose and lungs, and occasionally unconsciousness. The cause of the disease is uncertain. According to one theory, caisson disease is due to poisoning by carbonic acid. According to another theory, it is due to congestion of the internal organs with subsequent blood-stasis, resulting in possible blocking of the blood-vessels by small thrombi, followed in turn by a necrotic process. Finally, according to a third theory, the disease is due to increased solution by the blood of the compressed gases of the air (principally nitrogen and carbonic acid) and to their rapid liberation during decompression. Judging from the careful observations made in 1891 by Van Rensselaer, the second theory is probably nearest to the truth.

In the treatment of caisson disease, morphia, heat; stimulants, strychnine, and ergot are recommended. Returning to compressed air for a time, and then emerging very slowly, has benefited many sufferers. Preventive treatment may consist in securing the removal of carbonic acid from the air in the caisson and increasing the time spent in 'locking out' to one minute for every three pounds of pressure, a sudden transition from compressed air to the pressure of the atmosphere being quite dangerous. Above all, only perfectly sound men should be selected for work in caissons. Consult: Pol and Watelle, "Mémoire sur les effets de la compression de l'Air," in *Annales d'hygiène publique et de médecine légale* (Paris, 1884); Oertel, "Handbuch der respiratorischen Therapie," in Ziemssen, *Handbuch der allgemeinen Therapie*, Band 1, Theil 4 (Leipzig, 1882); Smith, *The Physiological, Pathological, and Therapeutic Effects of Compressed Air* (Detroit, Mich., 1886); and Lloyd, "Effects of Compressed Air," in *Twentieth Century Practice*, Vol. III. (New York, 1895). See FOUNDATION.

CAITHNESS, káith'nēs. The northernmost county of Scotland. Its area is 686 square miles (Map: Scotland, E 1). The general aspect of Caithness is level and bare, it being in great part moorland and destitute of trees, while the seacoast is bold and rocky, with many bays, inlets, promontories, and caves. The chief crops are oats, barley, turnips, and potatoes. The occupants of the small farms divide their time between farming and herring, ling, cod, salmon, and lobster fishing. Wick, the county town, is the chief seat of the British herring fishery. Population, in 1801, 22,600; in 1851, 38,700; in 1891, 37,177; in 1901, 33,860.

CAITHNESS FLAGSTONE. A dark-colored bituminous schist, slightly micaceous and

calcareous, valuable on account of its toughness and durability for pavements, cisterns, and various other purposes. Flagstones of this material are largely exported. They belong to the Devonian Old Red Sandstone, and contain abundant remains of fossil fishes. See DEVONIAN and OLD RED SANDSTONE.

CATUS. The name assumed by Kent in Shakespeare's *King Lear*.

CAIUS, DOCTOR. A French physician in Shakespeare's *Merry Wives of Windsor*. He is in love with Anne Page, and elopes with a boy disguised in her clothes.

CAIUS, kēz, JOHN (1510-73). An English physician, the co-founder of Gonville and Caius College, Cambridge. His real name was Kay or Kaye, which he Latinized into Caius. He was born in Norwich, was educated at Gonville Hall, Cambridge, and, in medicine, at the University of Padua and elsewhere on the Continent, spending much time in search of accurate texts of Galen and Hippocrates. On his return he practiced with success at Cambridge, Shrewsbury, and Norwich. In 1547 he was elected a fellow of the College of Physicians, of which he was afterwards nine times elected president. He also became physician to Edward VI., Queen Mary, and Queen Elizabeth. He acquired much wealth from the practice of his profession and employed it in the encouragement of science and learning. In 1557 he refounded Gonville Hall, thereafter known as Gonville and Caius College. In 1559 he was chosen master, and, although he was a Roman Catholic, he retained the office under Elizabeth. His books number twenty-seven titles, including critical, antiquarian, and scientific works, the most famous of which is *A Booke of Counsell Against the Sweate and Succatyng Sickness* (1552).

CAIUS COLLEGE. See GONVILLE AND CAIUS COLLEGE.

CATUS GRAC'CHUS. A tragedy by J. Sheridan Knowles, published in 1815 and produced at the Belfast Theatre, on February 13 of that year. Macready brought out a remodeled version on November 18, 1823, at Covent Garden.

CAIVANO, kī-vā'nō. A city in south Italy, five miles north of Naples, with which it is connected by a street railway (Map: Italy, J 7). The chief trade is in the grain, hemp, fruit, wine, and olives that grow in the vicinity. It was a place of considerable strength in the Middle Ages, and still retains remains of walls and towers. Population (commune), in 1881, 12,000; in 1901, 12,204.

CAIX, ká-ěks', NAPOLEON (1845-). An Italian philologist. He was born at Bozzolo, near Mantua, and was educated in Cremona and Pisa. In 1869 he became professor of ancient languages at the Lyceum of Parma, and in 1873 professor of Romanic languages and comparative philology at the Institute of Higher Studies, Florence. The following are some of his numerous publications: *Saggio sulla storia della lingua e dei dialetti d'Italia* (1872); *Sulla lingua del contrasto* (1876); *Le origini della lingua poetica italiana* (1880), which work is generally considered his best.

CAJAMARCA, ká'há-már'ká. An interior department of Peru, in the northwestern part of the republic (Map: Peru, B 5). It has an area

of 12,538 square miles, comprising a highly mountainous district which belongs to the basin of the river Marañon. Population, in 1896, 442,412. The department is noted rather for mineral wealth—principally gold, silver, copper, iron, and coal—than for animal or vegetable life. Cajamarca until 1854 formed part of the Department of Libertad.

CAJAMARCA, or **CAXAMARCA**, *kä'hä-mir'kä* (Quichua *ceassac*, *casac*, frost, ice + *marca*, place, town, referring to its severe climate). A city of Peru, capital of the department of the same name, situated on the east slope of the Andes, at an elevation of about 9000 feet above sea-level; 84 miles from the Pacific coast and 310 miles north by west of Lima (Map: Peru, B 5). It enjoys a moderate temperature; is laid out with broad streets crossing at right angles; and contains several plazas. There are two fine churches, secondary colleges for both sexes, a prison of modern construction, and the ruins of the palace of Astopilco, where Atahualpa, the last of the Incas, was killed in 1533 by Pizarro. Cajamarca is one of the oldest cities of Peru, and figured prominently at the time of the Spanish Conquest. Three miles to the east are hot sulphur springs known as the Incas' baths. The most important manufactures are steel articles, cotton and woolen goods, and straw hats. Population, about 12,000.

CAJÉPUT (Malay *kāyā*, tree + *putih*, white), *Melaleuca leucadendron*. A tree of the order Myrtaceae, from the leaves of which the pungent, aromatic, volatile oil called oil of cajeput is obtained by distillation. The cajeput-tree occurs from the Malay Peninsula to Australia, and is a tree 30 to 40 feet high and 2 feet in diameter, with a crooked trunk, papery bark, white wood (whence the name, cajeput), elliptical, lanceolate, alternate leaves, and terminal spikes of white flowers. The greater number of the species are natives of Australia, where more than a dozen well-marked species are known, some of them very beautiful shrubs and frequent ornaments of British hothouses. Much of the oil of cajeput of commerce is prepared from *Melaleuca leucadendron*, but volatile oils similar in many respects are distilled from the leaves of many other species. A hundred pounds of leaves yield slightly less than one pound of oil. It is maintained by some that the true oil of cajeput comes only from *Melaleuca minor*, but that species cannot be distinguished botanically from *Melaleuca leucadendron*. The oil contains a number of complex constituents, as cajeputol, hydrocarbons, various ethers, etc. It is a stimulant, counter-irritant, diaphoretic, and antiseptic. In India it is used extensively as an external application for rheumatism. The oil is rather heavy, and usually is of a greenish tinge. The wood is hard, close-grained, and durable, especially when laced under ground. The bark is useful for tacking, etc. In Australia these trees are known as tea-trees. *Melaleuca axillaris* produces a thin, spongy bark, that can be used for lotting and filter paper.

CAJETAN (Lat. *Cajetanus*) (1469-1534). An Italian ecclesiastic, whose real name was Jacopo de Vio (in religion Tomaso), the name Cajetan being assumed by him from his birthplace Gaeta (Cajeta). At the age of 15 he

entered the Dominican Order, studied for the next few years at Naples, Padua, and Ferrara (where he held his own in a public disputation with Pico della Mirandola), and in 1508 became general of his order. Leo X. made him a cardinal in 1517, and in the following year sent him to Germany to urge the Emperor and the Scandinavian kings to form a league against the Turks. While on this errand he was commissioned to examine Luther personally, and send him to Rome if need were. Luther appeared before him at Augsburg, but refused to retract his teaching on indulgences, and his breach with the Church was only widened by the discussion. In 1523 Cajetan was sent as legate to Hungary; but Clement VII., on his accession, recalled him to Rome, in order to make use of his theological knowledge and counsel. He was consulted on the divorce of Henry VIII., and decided unhesitatingly against it. He made a translation of the Old Testament, with a commentary, and wrote a treatise on the authority of the Pope, which was answered by the faculty of the University of Paris. He also wrote commentaries upon parts of Aristotle's writings, and upon the *Summa* of Aquinas. The latter is reprinted in the definitive edition of the great Aquinas issued under the patronage of Leo XIII. (Rome, 1882) (q.v.). He died in Rome, August 9, 1534. A collection of his works appeared at Lyons in 1639 (5 vols.); his life is prefixed. Consult, also, Schilbach, *De Vita ac Scriptis de Vio Cajetani* (Berlin, 1881).

CAJIGAL, *kä'hä-gäl'*, FRANCISCO ANTONIO (1695-1777). A Spanish colonial governor, born in Santander, Spain. He was Governor of Santiago, Cuba, from 1738 to 1747, and in 1742, during the war between Spain and England, repelled an attack of Admiral Vernon (q.v.). In 1747 he was appointed Governor-General of Cuba, which position he held until 1760, establishing a navy-yard and arsenal at Havana during his term of office. From 1700 to 1761 he was a viceroy of Mexico *ad interim*, and afterwards, until his death, lived in Spain.

CAKCHIQUEL, *käk'chè-käl'*. An important tribe or nation, of Mayan stock, formerly holding the central districts of Guatemala, where their descendants still reside. The name is that of a native tree, and their language is a dialect of the Quiche. At the time of their conquest by Alvarado, about 1524, they had attained a high degree of culture, as is evidenced by their architectural remains, their calendar and hieroglyphic systems, and their native literary productions. They had an intense religious veneration for maize, and there is even reason to suppose that they were the first people to reclaim it from its original wild condition. The best compendium of their history and culture is Brinton's *Annals of the Cakchiquels*.

CAKES, THE LAND OF. A title applied to Scotland, on account of the baps, scones, and oatmeal cakes which, with porridge, form the principal food of the country people. The epithet was prevalent in the Eighteenth Century.

CAKE-URCHIN. See SAND-DOLLAR, and SEA-URCHIN.

CALABAR (OLD) RIVER. An estuary-like bay on the north side of the Bight of Biafra, which penetrates British Nigeria just west

of the border line between it and Kamerun (Map: Congo Free State, A 2). It is about 10 miles wide, and extends inland nearly 25 miles. Near the head of the bay the waters of three rivers—the Cross, the Calabar, and the Akpa—are received through a deltoid border-land. The chief towns bordering the delta and estuary are Old Calabar, Duketown, and Creek town. The name Old Calabar is also applied to the region around the river, and now incorporated with British Nigeria.

CALABAR BEAN. The seed of *Physostigma venenosum*, a twining, half-shrubby plant, native of western Africa, of the natural order Leguminosae, nearly allied to the kidney-bean, but of a genus distinguished by the hood-shaped stigma and the deeply furrowed hilum of the seed. The following are the leading characters of the bean itself: "About the size of a very large horse-bean, with a very firm, hard, brittle, shining integument, of a brownish-red, pale-chocolate, or ash-gray color. Irregularly kidney-shaped, with two flat sides, and a furrow running longitudinally along its convex margin, ending in an aperture near one end of the seed. Within the shell is a kernel, consisting of two cotyledons, weighing on an average about 46 grains, hard, white, and pulverizable, of a taste like that of the ordinary edible leguminous seeds, without bitterness, acrimony, or aromatic flavor. It yields its virtues to alcohol, and imperfectly to water." It is used in the form of an emulsion by the natives of Africa, as an ordeal when persons are suspected of witchcraft. It is believed that if one vomits them he is innocent; if they are retained and death occurs, he is guilty. If the accused person is innocent he will usually eat a large number without hesitation, and so cause vomiting; if he hesitates and takes little, this does not occur. In 1855 Dr. Christian very nearly fell a victim to his zeal for science in experimenting on some specimens of this bean which had been sent to Edinburgh by some African missionaries, dangerous symptoms having been produced by 12 grains of the kernel which he swallowed. In 1861 Dr. Thomas R. Fraser tried the effects upon himself of doses of 6, 8, and 10 grains. The general symptoms were epigastric uneasiness, great feebleness, dimness of vision, salivation, giddiness, and irregular, feeble, and slow heart's action. When placed on the eyeball, this substance contracts the pupil, decreases intra-ocular tension, and produces near-sightedness. In 1864 fifty children were poisoned by eating these beans, which were swept out of a ship at Liverpool. A boy aged 6 years, who ate six beans, died very speedily. The chief symptoms in these cases were griping, vomiting, and contracted pupils; the face was pale, the eyes bright and protruding, and in trying to walk the children staggered, as if they were drunk. The bean contains two alkaloids—physostigmine, or eserine, which represents the chief activity of the drug; and calabarine, which has a tetanizing action like strychnine. It has been used medicinally, in small doses, in chorea, tetanus, and strychnine poisoning. It is employed to counteract the dilatation of the pupil caused by atropine, to lessen intra-ocular tension in glaucoma, and to alternate with atropine in breaking up adhesions in iritis. Being now a recognized

medicinal agent, it is satisfactory to know that the dangerous and even fatal effects of excessive doses may be prevented by administering belladonna (nightshade), or its active principle, atropine. Belladonna has also an opposite action on the eye to that of this substance. When the pupil is contracted by Calabar bean, it may be dilated to its normal size or larger by belladonna; and when it is dilated by belladonna, it may be reduced to its normal size or smaller by Calabar bean; but the action of eserine is not as durable as that of atropine.

CALABASH GOURD (Fr. *calabasse*, Sp. *calabaza*, a dry gourd; cf. Pers. *kharbuz*, melon. Little Russ. *harbuz*, pumpkin, watermelon), or BOTTLE GOURD (*Lagenaria vulgaris*). A climbing annual plant of the natural order Cucurbitaceae, cultivated in tropical countries. The angular leaves and the thin stem of the plant feel sticky to the touch, and have a disagreeable odor. The odor of the white flowers resembles that of musk. The hard rind of the bottle-shaped fruit, called calabash, is much used in tropical countries for holding liquids. The pulp of the common bottle gourd is worthless, and cannot be used as an article of food. Other varieties of *Lagenaria*, however, bear an edible fruit, which is sometimes sweetened with sugar and offered for sale. For illustration, see Plate under CUCUMBERS.

CALABASH-TREE (*Crescentia cujete*). An evergreen tree found in the West Indies and in the tropical parts of America, belonging to the order Bignoniaceae. In height and size it resembles an apple-tree, and has broad, lanceolate leaves, tapering to the base; large, whitish, fleshy flowers scattered over the trunk and older branches; and a gourd-like fruit, sometimes a foot in diameter. The wood of the tree is tough and flexible, and is well adapted for coach-making. The most useful part is the hard shell of the fruit, after the outer skin is removed. Under the name of calabash, it is much used in place of bottles, for holding liquids, and for goblets, cups, water-cans, etc. These shells may even be used as kettles for boiling liquids. They are sometimes highly polished, carved with figures, tinged with various colors, and converted into ornamental vessels. The rinds of gourds are sometimes similarly used, and called calabashes.

CALABAZAR, ká'lá-bá-thār'. An inland city of Cuba, in the Province of Santa Clara, about 20 miles north by east of Santa Clara. It has a fine parish church and a pretentious municipal building. Population, in 1899, 1575; municipal district, 13,410.

CALABOZO, ká'lá-bó'só (Sp., *dungeon*). A town in Venezuela, capital of the State of Guárico, about 120 miles south-southwest of Caracas (Map: Venezuela, D 2). It is situated on the Guárico River, in the fertile grazing region of the great plains, and is an important commercial centre, with a trade in live stock, hides, cheese, timber, etc. Calabozo is the see of a bishop. The climate in this vicinity is excessively hot, and inundations are not infrequent. Calabozo was a humble native village until the early years of the Eighteenth Century, having been founded in 1730. Population, about 6000.

CALABASH, ETC.

1. CASTOR OIL PLANT (*Ricinus communis*).
2. CEDAR OF LEBANON, CONE AND FOLIAGE (*Cedrus Libani*).
3. CALABASH TREE (*Crescentia cujete*).

4. FRUIT OF CALABASH TREE.
5. CATALPA OR INDIAN BEAN TREE (*Catalpa bignonioides*).
- 5a. CATALPA FRUIT OR INDIAN BEAN.

CALABRIA (Gk. *Καλαβρία*, *Kalabria*). The southernmost peninsula of Italy, having the Ionian Sea and the Gulf of Tarento on the east, and the Tyrrhenian Sea on the west (Map: Italy, p. 8). Its area is 5819 square miles. The surface is very mountainous, the peninsula being traversed through its entire length by the Apennine Mountains. Owing to its elevated surface, Calabria has a moderate and healthful climate. The flora is extremely rich and varied. The mountain slopes are covered with extensive forests of pine, oak, beech, and numerous other trees, interspersed with vineyards and olive gardens. Grain, rice, southern fruit, hemp, and wax are raised and exported in considerable quantities, and the raising of domestic animals is extensively engaged in by the inhabitants. Of mineral products, Calabria yields marble, alabaster, gypsum, salt, and some copper. The province is purely agricultural, the manufacturing industries being only slightly represented. There are very few large towns, and the railways run chiefly along the coast. For administrative purposes, Calabria is divided into the three provinces of Catanzaro, Cosenza, and Reggio di Calabria, with a total population of 1,366,982 in 1900. The Calabrians are mostly plain folk, quite superstitious, and generally ignorant.

In Roman times the name Calabria was given to the southeastern peninsula of Italy, nearly corresponding to the modern Province of Lecce, a portion of which is included in modern Calabria, which answers to the ancient Bruttium. The name Calabria, as applied to the district now known by that name, appears to have originated with the Byzantines some time prior to the conquest of the country by the Normans. Before the unification of Italy Calabria constituted a province of the Kingdom of the Two Sicilies.

CALADIUM (Neo-Lat.; possibly from Scotch *kale*, *kail*, cabbage—a variant of *cole*). A genus of aroid plants related to *Arum*. There are about a dozen species, and numerous varieties that are cultivated in hothouses for their large, beautifully variegated, arrow-shaped leaves. They are closely allied to the *Colocasias*, which, in addition to being highly ornamental bedding plants, furnish the Taro (q.v.) of the Pacific islands. See ELEPHANT'S-EAR.

CALÁGANE, ká-lá'-gá-ná. A Malayan people on Davao Bay, Mindanao. See PHILIPPINES.

CALAH. An Assyrian city mentioned in Gen. x. 12, and no doubt identical with Kalchu, which frequently occurs in the Assyrian inscriptions as the name of an important city. According to Ashurnazirpal (B.C. 885-60), Calah was built by Shalmaneser I. (c.1250). It was rebuilt by Ashurnazirpal in B.C. 880. He adorned it with a massive wall on the northern side, beautiful gardens along the banks of the Tigris, lofty temples, and huge palaces. In one of these palaces was found the 'black obelisk,' recording the tribute paid by "Jehu, the son of Omri," to Shalmaneser II. (860-25). Building operations were carried on in Calah by Shalmaneser I., Ashurnazirpal, Shalmaneser II., Tiglathpileser III. (745-28), Sargon (722-05), Esaraddon (681-68), and Ashar-til-ilani-ukin (626-1). The largest zikkurat was 167 feet square and 140 feet high, and had seven stages. Dur-

ing a number of reigns Calah was the residence of the Court, but in population it probably never equaled Nineveh, or even Ashur. It was the city that Layard discovered at Nimrud, 20 miles south of Kayunjik, when he supposed that he had found Nineveh. Since no tablets have been found at Nimrud, it has been assumed that Sennacherib (705-681) removed the temple library to Nineveh. Consult: Layard, *Nineveh and Its Remains* (London, 1875); G. Smith, *Assyrian Discoveries* (London, 1875); id., *Chaldean Account of Genesis* (London, 1875); Winckler, *Geschichte Babyloniens und Assyriens* (Leipzig, 1892); Rogers, *History of Babylonia and Assyria* (New York, 1901).

CALAHORRA, ká'lá-ór-rá (anciently, Lat. *Calagurris*, later *Kalaharral* of the Saracens, from Ar. *Kalat*, castle, and *harral*, stone). A town of Spain, in the Province of Logroño, Old Castile, 24 miles southeast of the city of Logroño, situated on the small river Cidacos, about 2 miles from its confluence with the Ebro (Map: Spain, D 1). It is the seat of a bishopric, and the cathedral is the principal building. The town has a brisk trade in local agricultural products. Population, in 1897, 9500. Calahorra occupies the site of the ancient Calagurris, celebrated in classic history for the obstinate but unsuccessful resistance it offered (B.C. 78) to Afranius, Pompey's legate, when the citizens slaughtered their wives and children for food rather than surrender. Calahorra was the birthplace of Quintilian, the rhetorician.

CALAIS, kál'is. A city and port of entry in Washington County, Maine, 120 miles east by north of Bangor, on the Saint Croix River, at the head of tidewater, and opposite Saint Stephen in New Brunswick (Map: Maine, J 5). The most northeasterly seaport in the United States, it is the terminus of the Saint Croix and Penobscot Railroad, and has railroad communication also by the Canadian Pacific through Saint Stephen, with which it is connected by an international bridge. The river furnishes abundant water-power, to which is due the great lumber trade of the city. Ship-building is also an important industry, and there are foundries, machine shops, marble and granite quarries, and manufactures of shoes, calcined plaster, woolen goods, etc. The city contains a public library of 7500 volumes, Calais Academy, and Memorial Park. Pierre du Guast, Sieur de Monts, who in 1605 founded at Port Royal the first French settlement in Canada, spent the winter of 1604-05 on Big Island, within the present city limits. Calais was settled in 1779, incorporated as a town in 1809, and chartered as a city in 1850. It was nearly destroyed by fire in August, 1870. The government is administered under a charter of 1883 (revised 1901), which provides for a mayor, elected annually, and a city council, which elects heads of all departments. Population, in 1890, 7290; in 1900, 7655. See I. C. Knowlton, *Annals of Calais* (Calais, 1875).

CALAIS, ká'lá' (Med. Lat. *Calailia*, *Calaisis*). A seaport town and fortress of the first class in the Department of Pas-de-Calais, France, on the Strait of Dover, near its narrowest part, the distance from the town of Dover, England, not being more than 18 miles (Map: France, H 1). On the south and east, low, marshy grounds, which can be laid under water for the defense of

the city, extend almost to the walls. The town, adjacent country, and port are commanded by the citadel, which is situated at the west end of the town, while seven forts, by their cross-fire, defend the weakest points. The harbor, which was formerly shallow, has been greatly improved, has a light-house 190 feet high, and a port accessible to the largest vessels. As one of the chief ports of debarkation for travelers from England to France, it has frequent steam communication with Dover and London. The city is square in form; its streets are, for the most part, broad and well paved; and its ramparts form pleasant promenades. Among its objects of interest, the most noticeable are the Church of Notre Dame, the old Hôtel de Ville, and the Hôtel de Guise. It has become a manufacturing town of some importance. The chief manufactures are bobbinet (tulle), machine-made lace, hosiery, etc. A number of mills produce silk, wool, cotton, and linen goods, and hats and gloves are extensively made. Calais has also distilleries, salt-refineries, and shipyards. Calais sends numerous boats to the herring and cod fisheries on the coasts of Scotland and Iceland. Its exports consist of eggs, corn, wine, brandy, etc., and it is the entrepôt for the produce of the district. It also does a large business in petroleum. In 1873 a school of artillery was established in Calais. It has an abundant water-supply, brought from the neighborhood of Guines. Population, in 1896, 56,940.

In the Ninth Century Calais was a small fishing village. In the following century it was much improved by Baldwin IV., Count of Flanders, and enlarged and strengthened by the Count of Boulogne. In 1347, after a long siege, it was captured by Edward III. of England, whose hard terms, and the self-devotion shown by six of the citizens, who were saved by Queen Philippa, form one of the most interesting passages of history. The English retained it until 1558, when it was captured by the Duke of Guise, since which time (with the exception of two years, 1596-98, when it was in the possession of the Spaniards) it has remained in French hands. Consult: Calton, *Annals and Legends of Calais* (London, 1852); P. W. T., "Modern Calais," in *Nautical Magazine*, Vol. LXVII. (London, 1898).

CALAI'S and **ZETES**, zē'tēz. In Roman mythology, the two winged sons of Boreas. They took part in the Argonautic expedition, during which they rescued the blind King Phineus from the attacks of the Harpies. They were said to have been slain by Hercules on the island of Tenos, where their graves were shown.

CAL'AMANDER WOOD. See **EBONY**.

CAL'AMARY (Neo-Lat. *calamarius*, from Lat. *calamus*, reed, pen). An Anglicized form of a European name for certain squids, given in allusion to the feather-pen-like internal shell, often called a calamary. Pen-and-ink fish is another and similar name. See **SQUID**.

CALAMATTA, kā'lā-māt'tā, LUIOI (1802-69). An Italian engraver. He was educated in Rome, but spent much time in Paris. In 1837 the Belgian Government commissioned him to found and direct a school of engravers in Brussels, where he had such pupils as Gustave Biot and Leopold Flameng. He is best known, perhaps, by the engraving of the head of Napoleon. Among his numerous works are engravings of

Ary Scheffer's "Francesca da Rimini;" "La Concordia," after Leonardo da Vinci; a portrait of George Sand, from life; and the "Madonna della Sedia" of Raphael. He spent his last years as professor of drawing in the Academy of Milan. His engravings are remarkable for correctness and exquisite finish.

CALAMBABA, kā-lām'bā. A town of Luzon, Philippines, in the Province of Laguna. It is 27 miles west of Santa Cruz, and is connected by roads with several towns of the province. It is a telegraph station. Population, in 1898, 11,480.

CALAMBUCO, kā'lām-bū'kō (Sp., probably from Pers. *kalambak*, fragrant wood). A tree found in the northern part of the island of Luzon, and considered superior to teak or live oak for ship-building. It is dark and hard, like teak, and is proof against the destructive white ant of the Malay region. Warlike, mechanical and agricultural tools and implements are made from it. The aloes-wood is produced by *Aquilaria agallocha*, a large tree with heavy wood shaded with green. It is aromatic, and is burned as incense. Diseased specimens of this and another species are said to yield the eagle-wood. It is possible that calambugo is a product of the same or related species.

CALAME, kā'lām', ALEXANDRE (1810-64). A Swiss landscape painter. He was born in Vevey, and studied in Geneva with Diday, whose successor as head-master of the art school he afterwards became. In 1842 he exhibited in Paris the pictures entitled, "Mont Blanc;" "Jungfrau;" "Lake of Brienz;" and "Pass of Monte Rosa" (now in the Leipzig Gallery). He settled in Geneva, where he lived until 1863, and where a monument was dedicated to his memory, April 3, 1880. He was one of the best landscape painters of his day, and the best depicter of Alpine scenery. Besides the pictures already mentioned, and his numerous fine lithographs and etchings, Calame produced the following works: "Bernese Oberland" (Leipzig Gallery); "Pass of Monte Cervino" (ib.); "Ruins of Pæstum" (ib.); "Schreckhorn" (Basel Museum); "Wetterhorn" (ib.); "Waterfall Near Meiringen" (Berne Gallery); "Lake of Lucerne" (Berlin Museum); "The Four Seasons" (Geneva Museum); "The Four Divisions of the Day" (Basel Museum); "Lake of the Four Cantons" (ib.).

CALAMIANES, kā-lā'mē-ā'nās. A group of islands in the western part of the Philippine Archipelago, in latitude 12° N. and longitude 120° E., situated between the islands of Mindoro (from which it is separated by Mindoro Strait) and Palawan (Map: Philippine Islands, D 7). The principal islands are Busuanga and Calamian. They are all hilly more or less, but have a very fertile soil, yielding tropical fruits in abundance. There are some gold and iron deposits. The climate is hot and unhealthy. During the Spanish régime the Calamianes, together with the Cuyos group and the northern part of Palawan, formed the Province of Calamianes, with an area of 340 square miles and a population of 20,000.

CALAMIANO, kā-lā'mē-ā'nō. A Visayan dialect mixed with Tagalog, spoken in northern Palawan and the Calamianes Islands. See **PHILIPPINES**.

CAL'AMINE (Fr., from *Min*, lead, corrupted from Lat. *min*).

silicate that crystallizes in the orthorhombic system. The name was originally applied to mineral zinc carbonate, but this is now known as *smithsonite*, while *calamine* is restricted exclusively to the silicate. It occurs massive or crystalline, often in mammillary, botryoidal, and fibrous forms, generally white, although sometimes with a bluish or greenish shade, and less frequently yellowish to brown. Calamine is found in Germany, Austria, in Derbyshire, England, and at various localities in New Jersey, Pennsylvania, and elsewhere in the United States. When pure it contains 52 per cent. of zinc, and is therefore a valuable ore of that metal.

CALAMINT (Lat. *calaminthe*, Gk. *καλαμίνθη*, *kalaminthē*, from *καλός*, *kalos*, beautiful + *ἴνδη*, *minthē*, mint), *Calamintha*. A genus of plants of the order Labiatae, nearly allied to *salvia* (*Melissa*). The common calamint (*Calamintha officinalis*) is not infrequent in England. It has whorls of flowers on forked, many-flowered stalks, and crenate leaves with an agreeable aromatic odor. It is used to make herb tea, and as a pectoral medicine. A number of species to which similar virtues are attributed are found in the United States. Two or three species of shrubby calamints are sometimes planted in borders of flower-gardens. See **BALM**.

CALAMIS (Gk. *Κάλαμος*, *Kalamis*). A sculptor of Greece, who flourished in the second quarter of the Fifth Century B.C. His works were widely scattered throughout Greece, but nothing definite is known as to the course of his life. He may be regarded as the representative artist of the transition period between the archaic art before the Persian wars and the art of Phidias. No works of Calamis have come down to us, though attempts have been made to identify several pre-Phidian types with some of his celebrated works.

CALAMITES, *kāl'a-mī'tēz* (Gk. *καλαμίτης*, *calamitēs*, reed-like, from *κάλαμος*, *kalamos*, reed). A genus of fossil plants, appearing first in the Devonian rocks, and rising through the intermediate formations to the Jurassic, where it is represented by a single species. They reach their maximum development in the coal-measures, where a large number of species have been determined. The tall, straight stems rose from a swampy clay soil in profusion in the crevices of sigillaria, and formed a striking and characteristic feature of the coal flora, though they supplied little material for the structure of coal. They are hollow-jointed cylinders, with longitudinal furrows, giving the fossil the appearance of equiseta. From this resemblance, botanists have generally considered them as 'huge horse-tails.' They belong to the equiseta, and the study of many specimens, both macroscopically and microscopically, has developed a number of sub-genera. The modern 'horse-tail rush' represents, according to Seward, a degenerate type of the calamitean group. Hooker was unable to detect any traces of structure, in carefully prepared specimens, or the presence of those siliceous stomata which characterize equiseta, and which should have been preserved in the fossil state; but later investigators have been more successful in finding specimens from which internal structures could be determined. Fleming has shown that the furrows are marked

of a calamites trunk would show rings of scars on the interior cavity. The lower portion where branches had fallen off, while higher up the younger branches contained whorls of slender leaves and long, slender cones. The root termination was conical, the joints increasing upward in size and length. The foliage of calamites has been described under different names. *Asterophyllites* includes jointed and fluted stems, with branches proceeding from the joints, and bearing long, pointed leaves. *Annularia* has closely arranged leaves, while in *Sphenophyllum* the leaves were wedge-shaped. See **COAL**; **CARBONIFEROUS SYSTEM**.

CALAMITIES OF AUTHORS, THE. See **DISRAELI, ISAAC**.

CALAMUS. See **RATTAN**, and **DRAGON'S-BLOOD**.

CALAMUS (Lat., Gk. *κάλαμος*, *kalamos*, reed; cf. AS. *healm*, Engl. *hulm*). A word applied not only to the reed, but also to objects made from it, and especially to the ancient pen, which was commonly a split reed. Egypt furnished most of these reeds, though those from Cnidus were also highly esteemed. They were trimmed and split with a knife like a quill pen, and were generally kept in a case. Imitations of the reed pens in bronze have been found. Reed pens are still used in the East, the Arabic word being *Kalām*. The same name is also applied to the reed pipe, or pastoral flute. See **SYRINX**.

CALAMUS. A name sometimes given to the sweet flag (*Acorus calamus*). See **ACORUS**.

CALAMY, EDMUND (1600-66). An English divine. He was born at Walbrook, February, 1600; studied at Pembroke Hall, Cambridge, where he attached himself to the Calvinistic party; and afterwards became domestic chaplain to the Bishop of Ely. In 1826 he was appointed lecturer at Bury Saint Edmunds, but resigned his office in 1636, when the order to read the *Book of Sports* began to be enforced. In 1639 he was chosen minister of Saint Mary, Aldermanbury, London. He now entered warmly into the controversies of the time, and became noted as a leading man on the side of the Presbyterians. He had a principal share in the composition of *Smectymnus*, a work intended as a reply to Bishop Hall's *Episcopacie by Divine Right* (London, 1640), and one of the most able and popular polemics of the day. Like the mass of the Presbyterian clergy, he was monarchical and not republican in his political opinions. He disapproved, therefore, of the execution of Charles, and the Protectorate of Cromwell, and did not hesitate to avow his attachment to the royal cause. He was one of the deputies appointed to meet Charles II. in Holland and congratulate him on his restoration. His services were recognized by the offer of a bishopric, which he refused from conscientious scruples. He took part in the Savoy Conference (1661), but was ejected from his living by the Uniformity Act (1662); for venturing to preach in his church (December 28, 1662), he was cast into prison, but Charles II. secured his release. He died in London October 29, 1666. Two of his sons were educated for a religious profession: the one, Rev. Dr. Benjamin Calamy, became a High Churchman, and wrote *A Discourse About a Scrupulous Conscience*; the other, Edmund Calamy, was ejected for non-conformity, and had a son, also named Edmund

(1671-1732), who acquired reputation as the biographer of the ejected clergy. He was born in London, April 5, 1671, educated among the Dissenters and in Holland (1688-91); was pastor in London, 1692, and died there June 3, 1732. He was held in high regard, and his *Nonconformists' Memorial* (1778), as it is now called, a book which underwent important changes while in the author's hands, is the best source of knowledge respecting the 2000 ministers ejected from the Church of England by the Act of Conformity. Consult Palmer, *Abridgment of Nonconformists' Memorial* (London, 1802-03), and his autobiography, *Historical Account of My Own Life* (London, 1830).

CALANCHA, ká-lán'chá, ANTONIO DE LA (1584-1654). A Peruvian chronicler. Early in life he entered the Augustinian Order at Lima, and afterwards traveled extensively through Peru for the purpose of examining the ancient ruins of that country and of recording its traditions. As a chronicler of the Augustins at Lima he wrote the important history (completed in 1633), which has been translated into French, under the title *Histoire de l'église du Pérou aux antipodes et d'un grand progrès de l'église en la conversion de Gentils par la prédication des religieux ermites de l'ordre Saint-Augustin* (1653).

CAL'AND, or **KALAND**. A brotherhood of Roman Catholics devoted to charitable and devotional works, dating from the Thirteenth Century, and of considerable extent in Germany, Switzerland, and France. It degenerated so far that it was suppressed before the Reformation, its property being confiscated for public purposes.

CALANDO, ká-lán'dó (It., slackening, from *calare*, to lower, diminish, decrease). A musical term which means diminishing by degrees in power (from forte to piano) as well as in rapidity, thus combining both the *decrecendo* or *diminuendo* (q.v.) and *ritardando* (q.v.) effects, but in a somewhat slighter degree.

CALANDRA, ká-lán'drá, GIOVANNI BATTISTA (1586-c.1648). An Italian mosaicist, born in Vercelli. During the Pontificate of Urban VIII. it was discovered that dampness had begun to affect the paintings in Saint Peter's. It was considered advisable to replace certain of the pictures by copies in mosaic, and Calandra was the first to employ this art, afterwards brought to a much greater perfection by Christofori. He copied the "Saint Michael" of Cesari d'Arpino, and the four doctors of the Church by d'Arpino, Sacchi, Romanelli, and others.

CALANDRELLI, ká-lán-drél'lé, ALEXANDER (1834—). A German sculptor, born in Berlin. He studied at the academy in that city in 1847, and afterwards took a course with Friedrich Drake and August Fischer. His important works are decorative designs for the city hall of Berlin; a bronze relief, typifying the Danish War ("Statue of Victory", ib.); "Monument of Victory" (fifth municipal district, ib.); a marble statue of Cornelius, entrance-hall of Berlin Museum); an equestrian statue of Frederick William IV. (entrance to National Gallery, Berlin); an equestrian statue of Emperor William I. (Bromberg); a statue of the Elector Frederick I. (Siegesallee, Berlin).

CALANDRINO, ká-lán-dré'nó. An unfortunate character in Boccaccio's *Decameron*, the story of whose mishaps creates great amusement.

CALANDBONE, ká-lán-dró'ná (It.). A small variety of clarinet used by the Italian peasants, on which they play simple melodies, and also sometimes accompany their national songs. It has the holes of the common flute, but the intonation is produced as in the common pipe.

CALANTHA. The heroine of Ford's *Broken Heart*, daughter of King Amyclos of Laconia. She dies suddenly after being told of the deaths of all whom she holds dear. The scene of the announcement is a ballroom, and the episode has been strongly condemned by Hazlitt as "unnatural."

CAL'ANUS (Gk. *Kálanos*, *Kalanos*, from Skt. *kalyāna*, 'the fortunate'). A Hindu philosopher, apparently a Brahman ascetic, whose real name, according to Plutarch, was Sphines. He was for some time in the camp of Alexander the Great at the invitation of the conqueror, but having become seriously ill, he was burned alive at his own request at Persepolis.

CALAPAN, ká-lá-pán'. The capital of the island of Mindoro, Philippines, situated at the northeastern extremity of the island. It has a harbor and a fort. Population, in 1898, 5585.

CALAPE, ká-lá'pá. A town of Bohol, Philippines, situated on the western coast, 26 miles north of Tagbilaran. Population, in 1898, 10,000.

CALAS, ká-lás' or ká-lá', JEAN (1698-1762). A Protestant merchant of Toulouse, whose judicial murder was the cause of an agitation in which Voltaire took the leading part. It resulted in the amelioration of the legal position of Protestants in France, and particularly discredited the administration of justice under the declining monarchy. Calas was accused of murdering his son because he wished to become a Roman Catholic. The son had probably committed suicide, and there was no evidence to support the accusation, which originated in a mob, and was fostered by Roman Catholic religious societies, the White Penitents, and the Franciscans, who treated the suicide with the honors due to a martyr. After a trial which lasted a whole winter, the Parliament of Toulouse, by a majority of eight to five, condemned Calas to death on the rack and confiscated the estate of the family. Calas's widow made Voltaire's acquaintance in Switzerland, and he actively took up her cause. After long labor he secured a rehearing of the case and the Parliament of Paris declared Calas innocent and restored the estate to the family. The chief magistrate was degraded and fined. Consult Coquerel, *Jean Calas et sa famille* (Paris, 1858); and for Voltaire's part in the matter, Kreiten, *Voltaire* (Freiburg, 1878).

CALASTAO, ká-lá'sé-u'ó. A town of Luzon, Philippines, in the Province of Pangasinan, 9 miles southeast of Lingayen. Population, in 1898, 13,750.

CALATAFIMI, ká-lá'tá-fé'mé. A city of Sicily, 57 miles southwest of Palermo (Map: Italy, G 10). On a hill beside the town, and 1115 feet above the sea, is the castle, of Moorish design, now used as a prison. From it is a splendid view of the Temple of Segesta (q.v.) and of a mountainous landscape. The town had its name, Kalat al-Fimi, from the Saracens, who captured it in 828. In 1860 Garibaldi won his

first victory over the Neapolitan troops on a field 2 miles to the southwest, marked by a monument erected in 1892. The cheeses of the district have more than a local reputation. Population (commune), in 1881, 10,000; in 1901, 11,426.

CALATAYUD, *kā-lā'tā-yōōb'* (Ar. *kalat*, castle + *ayub*, a Moorish king). A city of Aragón, Spain, situated on the Jalón, near its junction with the Jiloca, about 48 miles southwest of Saragossa (Map: Spain, E 2). It is built at the base of two rocky ridges, 1700 feet in height, out of the ruins of ancient Bilbilis, which lay about 2 miles to the east. The city is divided into a new and old portion, the former with several fine streets and handsome squares, while the latter is composed of mean buildings and narrow, crooked streets. Calatayud has ruins of a noble Moorish castle, two collegiate churches, and a Dominican convent. It manufactures silk, linen, and hempen fabrics, woolens, paper, leather, etc., and carries on a trade in agricultural produce. Population, in 1897, 10,900.

CALATRAVA, *kā-lā-trā'vā*. A military and religious order in Spain, instituted in 1158, in the reign of Sancho III. of Castile. It received the town of Calatrava as a perpetual gift, on condition that it should defend it against the Moors. The order was confirmed by Pope Alexander III., in 1164, and very soon came to render effective service in the wars against the Mohammedans. While the Christian States in Spain were exhausting themselves by internal strife, the Order of Calatrava was the main bulwark against the Moors. In 1197 the latter captured Calatrava and the knights removed to Salvatierra. In 1212, however, they not only recovered Calatrava, but had an important share in the deadly blow which was struck at the power of the Almoravides. In 1213 Calatrava united with the Order of Avis. The power of the Knights of Calatrava was shown at the time they joined the orders of Alcántara and Santiago in exacting from Alfonso XI. a guarantee of their liberties and customs. The later history of Calatrava is a series of civil wars between the grand masters, which became so troublesome to the Government that Ferdinand and Isabella, in 1487-88, prohibited a new election and secured the grand-mastership to the Crown by a Papal bull in 1493. Later Charles V. made the order perpetual, with the King of Castile as head. In 1808 Calatrava became an order of merit. On March 13, 1872, the order was suppressed by the republican Government, but was reorganized by Alfonso XII., June 13, 1874. Those who entered the order took the vows of poverty and obedience. At first marriage was forbidden, but Paul III. in 1540 made this concession, and gradually the order lost most of its religious character. The original garb was black, but in 1396 Benedict XIII. (antipope) allowed the knights to adopt the red cross. The present dress is a mantle of white, decorated with a red cross, cut out in the form of lilies.

CALATRAVA, JOSÉ MARÍA (1718-1846). A Spanish statesman, born at Mérida. He became known as an eminent orator of the Liberal Party, and became a member of the Junta of Estremadura in 1808 and of the General Junta in 1810. Because of his radical views he was exiled

upon the restoration of Ferdinand VII., in 1814, but returned to Spain after the King's deposition. In 1821 he was elected to the Cortes, and in 1823 he became Minister of Justice, but when, through the intervention of the French, Ferdinand regained absolute power (1823), Calatrava was again banished. He lived in London until 1830, when he returned to Spain, became Minister of Foreign Affairs (1836), and was prominent in the parliamentary movement which resulted in the adoption of the more liberal Constitution of 1837. When Queen Isabella assumed the Government, in 1843, he was made a Senator.

CALATRAVA LA VIEJA, *lā vyā'hā* (Sp., Calatrava the Old, from Ar. *kalat*, castle + *Rabah*, a man's name), or OLD CALATRAVA. A ruined city of Spain, near Valdepeñas, situated on the Guadiana. In the Middle Ages it was a strongly fortified place; but nothing now remains save a single tower. Calatrava la Vieja was captured from the Moors by Alfonso VIII. of Castile, and given to the Templars; unable to defend it, they returned the gift to Sancho III. (1157). Raymond, Abbot of Fitero, and Diego Velasquez here instituted the Order of Calatrava (q.v.) in 1158. In 1197 the Moors captured Calatrava la Vieja, but it was retaken in 1212. About 1217 the Knights of Calatrava la Vieja built a convent in the neighborhood, naming the place Calatrava la Nueva (New Calatrava).

CALAU, *kā-lā'wā*, or **CALAWA**. A Malay people in northern Luzon. Their speech is mixed. See PHILIPPINES.

CALAVERAS (*kāl'ā-vā'ras*) **GROVE**. The nearest to San Francisco of the California groves of big trees. The grove is 70 by 1100 yards in extent, and contains about 100 of the big trees, of which the "Keystone State," the highest now standing, has an altitude of 325 feet and a circumference of 45 feet. The "Mother of the Forest" is 61 feet, and the "Father of the Forest," not standing, is 112 feet in circumference. The grove is State property under a commissioner.

CALAVERAS RIVER. A small river of central California, and a tributary of the San Joaquin, which it joins just below Stockton (Map: California, C 2). It rises in the Sierras of Calaveras County and pursues a southwesterly course.

CALAVERAS SKULL. A much-discussed human cranium reported to have been found in auriferous gravels below lava-beds near Angels, Calaveras County, Cal. The specimen was described by J. D. Whitney, and is preserved in the Peabody Museum, Harvard University. Satisfactory accounts of the object and its associations have been published by Holmes in the *Smithsonian Report* for 1901 and elsewhere. See ARCHEOLOGY, AMERICAN.

CALBAYOG, *kāl'ba'yōg'*. A town of Samar, Philippines, situated on the western coast, 12 miles northwest of Catbalogan. Population, in 1898, 30,250.

CALBUR'GA. See GULBARGA.

CALCAIRE GROSSIER, *kāl'kār' grō'syā'* (Fr., coarse limestone). The middle Eocene stage of the Tertiary system of France. The strata of which it is composed are almost wholly limestones, and they outcrop in great force in the Paris basin. They have been subdivided into lower, middle, and upper sub-stages, the first and

third being fresh-water deposits, and the second of marine formation. The strata are highly fossiliferous; the animal remains include mammalia, reptiles, and a large variety of lower life-forms. The Calcaire Grossier is represented in the English Tertiary by the Bracklesham beds; in the United States the Claiborne beds are equivalent to a portion of it.

CALCAR, kál'kär, JOHN or JOHANN DE. See **KALKAR**, JOHANN STEPHAN DE.

CALCAREOUS ROCK (Lat. *calcarius*, pertaining to lime, from *calx*, limestone, lime). Rock containing much lime, especially that in which the lime occurs in the form of carbonate (CaCO_3). Calcareous rocks may be chemically formed, as in the case of tufa, where lime carbonate in solution is precipitated through evaporation or other causes. They are generally aqueous rocks, and have been deposited in bodies of either marine or fresh water; the calcareous content has been supplied by the fossilized remains of the hard parts of animals that inhabited these waters. Thus many Paleozoic limestones are composed of shells, corals, and crinoidal fragments, while others, like chalk, consist of foraminifera and fragments of other minute organisms. A crystalline structure varying in degree from that of partially crystallized limestones to the granular statuary marble, is produced in calcareous rocks by metamorphic action. Oölite is a calcareous rock composed of small, concretionary, egg-like grains, resembling the roe of fish. The existence of the carbonate in rocks can be readily detected by the application of dilute nitric or muriatic acid, which causes effervescence through the liberation of carbonic acid. Quicklime is obtained from calcareous rocks by calcining them, i.e. by driving off the carbonic acid and other volatile matter by heat. Calcareous soils, often of great fertility, are produced from the disintegration of calcareous rocks. See **ROCK**; **OÖLITE**; **SOIL**; **LIMESTONE**; **CALCAREOUS TUFFA**.

CALCAREOUS TUFFA (It. *tufa*, from Lat. *tofus*, tufa, tuff), **CALC-SINTER**, **TRAVERTINE**, **STALACTITE**, **ONYX MARBLES**. Forms of carbonate of lime deposited from solution in springs, in limestone caverns, or by the evaporation of water in lakes, in the form of calcite or aragonite. When free from impurity they are white or translucent, but commonly they are stained with other substances, taking on yellow, gray, brown, or other colors. They have a spongy or cellular or concretionary structure, are banded, and often show rings of growth. A great variety of forms is exhibited, massive, tubular, botryoidal, stalactitic, or the forms of vegetable and animal remains which they sometimes incrust. Calcareous tufa has often been quarried and used for building purposes; the stone is quite soft when newly quarried and acquires hardness and solidity through exposure to the atmosphere. The temples of Prestum, Italy, built several centuries before the commencement of our era, were constructed of such massive calcareous tufa. See **CALCAREOUS ROCK**; **LIMESTONE**; **ROCK**.

CALCASIEU, kál'ká-shü. A river of southwest Louisiana, its headstream, Cypress Branch, rising in Natchitoches County (Map: Louisiana, B 3). It pursues a course at first southeast, then southwest, and empties into Lake Calcasieu (nearly 20 miles long and 3 to 6 miles wide),

which is connected with the Gulf of Mexico by the narrow Calcasieu Pass. By means of numerous branches, chiefly from the west, it drains a large area in southwest Louisiana, and is navigable for small boats for about 130 miles.

CALCEOLARIA (Neo-Lat., from Lat. *calceolus*, a little shoe, referring to the part of the corolla resembling a slipper). A genus of plants of the order Scrophulariaceae. There are numerous species, natives of South America, chiefly of that part of the Andes which is more than 9000 feet above the sea, a few of them reaching almost to the upper limits of vegetation. Some are found in lower and warmer situations, and some in the southern extremity of the American continent, others occurring in New Zealand and Mexico. They are so abundant in some parts of Chile and Peru as to give a peculiar aspect to the landscape. The calyx in this genus is four-partite; the corolla, two-lipped, the lower lip remarkably inflated, so as to form a bag; and the shape of the whole in some species considerably resembling that of a slipper. Some of the species are shrubby, some herbaceous, almost all the herbaceous species being perennial. Many of them have corymbs of numerous showy flowers. Yellow is the color which chiefly prevails in the flowers, and next to it purple; but the art of the gardener has succeeded in producing varieties and hybrids which exhibit many other rich and delicate tints. Calceolarias have been prominent in floriculture since about 1830, the curious appearance of the flowers combining with their beauty to render them attractive, and in no genus is the production of hybrids more easily or frequently effected. They are easily propagated by cuttings. Few plants require more liberal supplies of water. They are generally treated in the United States as half hardy or as greenhouse plants, and only the herbaceous forms are well known. Some of the species are used in South America for dyeing. The roots of *Calceolaria arachnoides*, which is claimed to be one of the parents of many of the hybrids, are largely employed in Chile, under the name of *reldum*, for dyeing woolen cloths crimson. For illustration. see **GREENHOUSE PLANTS**.

CALCHAQUI, kál'chá'ké. A tribe formerly living on the western border of the Chaco, about the present Tucuman, Argentina. Great walls of cut stone found in their ancient territory, and stone-built tombs in which are found mummies and deposits of gold and copper ornaments, attest a considerable degree of civilization, which may have been due to the Incas, who conquered the Calchaqui about the year 1450. Interesting details of their customs and home life are given by the earliest missionaries. They have been long extinct, unless, as Tschudi surmises, a refugee remnant still survives on the northern coast of Chile. Even their linguistic affiliation is a matter of conjecture.

CALCHAS, kál'käs (Gk. Κάλχας, *Kalchas*). The prophet of the Greek army before Troy, gifted by Apollo with knowledge of the past and future. Through his counsel Achilles, Neoptolemus, and Philoctetes were brought to the army. At Aulis he advised the sacrifice of Iphigenia (q.v.) to appease Artemis, and foretold the length of the war. The common tradition made him go from Troy to Colophon, where, at the

oracle of Apollo at Clarus, he met the prophet Mopsus, who defeated him in a contest of prophecy, whereupon he died of grief. His grave was shown in Italy.

CALCIFEROUS (Lat. *calx*, lime + *ferre*, to bear). The term given to a subdivision of the Ordovician system. It is usually a sandy magnesian limestone, known as the calciferous sand rock. It is found in Canada and New York, extending southward through New Jersey and Pennsylvania. Its equivalent is also to be seen in the magnesian limestones of Iowa, Missouri, and Michigan. The formation is now known as the Beekmantown beds, from the locality near the village of that name in New York State. See ORDOVICIAN.

CALCIMINE (Lat. *calx*, limestone). A composition of zinc-white and glue sizing mixed with water, and applied as a finish to the plastered ceilings and side-walls of rooms. By adding coloring matter, any color desired may be produced.

CALCINATION, or **CALCINING** (Fr., Med. Lat. *calcinatio*, from Lat. *calx*, lime). The process of heating or roasting in furnaces, kilns, or heaps the various metallic ores, limestones, cement-mixtures, etc. It is resorted to as the first stage in the extraction of the majority of the common metals from their ores, is an essential process in lime and cement manufacture, and is a process of oxidation. See IRON AND STEEL; CEMENT.

CALCITE (Lat. *calx*, lime), **CALCAREOUS SPAR**, or **CALC-SPAR**. An anhydrous calcium carbonate that crystallizes in the hexagonal system, and differs from the mineral aragonite only in its form of crystallization. The massive and crystalline varieties are known as *limestone*, *marble*, and *chalk* (qq.v.), and are found almost universally, and in all geological formations. It is generally white or colorless, although pale shades of gray, red, green, blue, violet, and yellow are known, and, owing to the presence of impurities, even black and brown varieties are found. The crystallized varieties include the *dog-tooth spar*, the acute scalenohedral, crystals of which suggest its name; similarly, the name of *nail-head spar* has been suggested by the form of its truncated crystals; *satin spar* is a fine fibrous variety with a silky lustre. *Iceland spar*, originally found in basalt rocks in Iceland, is a fine, colorless, translucent variety, with the property of double refraction; the finest specimens of this variety are used for making polarizing prisms. Calcite is found chiefly in the following localities: Andreasberg in the Harz Mountains, Alston Moor and Egremont, Cumberland, and Matlock, Derbyshire, England, and Rossie, N. Y., the copper-mines at Lake Superior, and Warsaw, Ill., in the United States.

CALCIUM (Neo-Lat., from Lat. *calx*, lime). A metallic element isolated by Sir Humphry Davy in 1808. The name is derived from the Latin *calx*, lime, showing that calcium is the metal contained in lime. Calcium is not found native, but occurs extensively in combination with other elements in the forms of calcite (including limestone, marble, and chalk), aragonite, dolomite, selenite, gypsum, etc. It is also found in river and spring waters and in the bodies of plants and animals. Spectrum analysis has revealed its presence in the sun. Davy obtained

metallic calcium by the electrolysis of calcium chloride in the presence of mercury, the metal remaining as a powder on heating the amalgam thus produced. Calcium (symbol, Ca; atomic weight, 40.07) is a lustrous, clear, yellowish-white, very ductile, and malleable metal of specific gravity 1.57. It melts at a red heat. The metal itself has no commercial application, although it is capable of forming a crystalline alloy with zinc. It is readily oxidized in the air, even at ordinary temperatures, and when heated to redness it burns with a very bright yellow flame. Like sodium and potassium, it decomposes water with evolution of hydrogen. With the non-metallic elements it is capable of forming compounds which are generally colorless and have an acrid taste. The more important of these compounds are described under their special names.

CALCIUM CARBIDE, Ca_2C . A compound of calcium and carbon. It was originally discovered in 1836 by Edmund Davy, who produced it simply as a laboratory curiosity. In 1862 Wöhler prepared it in Göttingen, and about the same time Berthelot, in Paris, obtained it, but only in small quantities. In 1892 Thomas L. Willson, in Spray, N. C., found that by heating a mixture of lime and carbon in an electrical furnace, calcium carbide and carbon monoxide were formed. Almost simultaneously Henri Moissan, in Paris, announced his discovery of a similar method for its production. Its property of decomposing water with the formation of acetylene gas had already long been known, and the foregoing method just described made possible the economical production of acetylene gas for illuminating purposes, and accordingly that industry has since been largely developed, especially in the United States. The calcium carbide, or carbide, as it is called commercially, is now largely manufactured at Niagara Falls, N. Y., and Sault Ste. Marie, Mich.; and also at various places in Europe. The process consists essentially in submitting a mixture of powdered lime and coke-dust to the action of carbon electrodes in a furnace at a temperature of about 3300° C. The fused material is allowed to cool and harden, after which it is removed. Calcium carbide is a hard, brownish crystalline compound with a metallic lustre and a specific gravity of 2.22, that is non-inflammable, infusible, and insoluble in most acids and all alkalis; is absolutely unaffected by jars, concussions, or time, and is an inert and stable substance, except when brought into contact with water. Its principal use is for the manufacture of acetylene. Since its commercial introduction into the United States, its manufacture has passed into the control of a single corporation, who report that over 7000 tons of carbide were consumed in the year ending June 1, 1899. Its history and methods of production have been largely described in the various technical journals, and the *Acetylene Gas Journal*, published in Buffalo, N. Y., is devoted to the exploitation of the new illuminant. Consult, also, Thompson, *Acetylene Gas: Its Nature, Properties, and Uses*; also *Calcium Carbide: Its Composition, Properties, and Method of Manufacture* (London, 1899). See ACETYLENE.

CALCIUM LIGHT. See DRUMMOND LIGHT.

CALCRAFT, JOHN WILLIAM. The *nom de plume* of John William Cole. See BRIDE OF LAMMERMOOR, THE.

CALCULATING MACHINES (from Lat. *calcularē*, to reckon, compute; see CALCULUS). Mechanical contrivances designed to facilitate computations, to relieve the calculator from the mental strain of his work, and to insure greater accuracy in results. Calculating machines exist in various forms, and are now made in such perfection that large business houses and banks regard them as a necessity, while many scientific computations would have been abandoned but for their help. An instrument which is used for the purpose of illustration or instruction in number work is called a reckoning apparatus, but one which automatically produces the results of number combinations involving the union of different orders is called a calculating machine.

The earliest known instrument of calculation of any importance is the *abacus*. The Chinese lay claim to its invention. Its use by the Egyptians as early as B.C. 460 is definitely asserted by

ARRANGEMENT OF NAPIER'S RODS.

Herodotus. It was probably used by the Babylonians, and certainly by the Greeks and Romans, from whom it spread to all Europe. It has existed in various forms—the knotted strings, the sand-board, the pebble-tray, the counters, and the frame of beads. The last form is still in use, known as the Chinese *swan-pan*, the Russian *Stchoty*, or the Japanese *Soro-Ban*. The ordinary *swan-pan* consists of a frame divided into two sections, holding several parallel rods, each containing several movable beads.

In the Chinese *swan-pan*, each bead on the bottom row in the right division represents one unit, and each on the bottom row in the left division represents five units. In the next higher row the value of each bead is ten times as great, and so on.

The first improvement over the ancient abacus consisted in the use of counters, on a plan attributed, probably erroneously, to Boethius. Later these counters bore numbers, and were attached to rods, disks, or cylinders, which could be moved so as to indicate the desired results.

A notable example of this type is the set of rods invented by Napier and known as *virgulae*: or, popularly, as Napier's rods or bones. These consist of flat pieces of bone or ivory, divided into squares, which (on ten of the rods) are subdivided by diagonals into triangles, except the squares at the upper ends of the rods, which spaces are numbered from 1 to 9.

To illustrate the process of multiplication, consider the product of 5978 by 937. Arrange the proper rods, as in the figure, so that the numbers at the top indicate the multiplicand, and on the left place the rod headed 1. In this rod find the right-hand figure of the multiplier, which in this case is 7. Passing across the horizontal row, add obliquely the two rows of corresponding digits, writing the results in each case as the digits of the first partial product. For example, the first figure on the right is 6; this is written in the units place in the first partial product. Next add the 5 and 9 in the adjoining oblique row, which gives 4 in the tens place, with 1 to carry. This makes 8 in the hundreds column. Proceed in the same way with the other figures of the multiplier, and add the partial products as in ordinary multiplication.

The chief point of improvement over the primitive abacus consists in supplying the instrument with moving scales, which enable the calculator to form number combinations without actually counting together the different addends. Kummer (1847) accomplished this by running parallel rods in grooves; Lagrous (1828) by concentric rings; Djakoff and Webb by bands on rollers.

Another form of the calculating machine is the *slide rule*, which is more generally employed than any other class of calculating instruments, particularly by engineers and statisticians. In its simplest form it consists of two rules, arranged to slide on each other, and so divided into scales that by sliding the rules backward or forward until a selected number on one scale is made to coincide with a selected number on the other, the desired result is read off directly on a third scale. By means of a duplex slide rule, where the rule may be set for four factors instead of two, more complicated problems may be solved. *Revolving slide rules* are employed to increase the virtual length of the scales and the number of decimal places to which results may be read. In the Thatcher calculating instrument, a cylinder 4 inches in diameter and 15 inches long revolves within a framework of triangular bars, each of which contains a scale on two sides. The scales contain 33,000 divisions and 17,000 engraved figures, executed on a dividing machine made expressly for the purpose. *Fuller's spiral slide rule* consists of a wooden cylinder containing a spiral scale 42 feet long.

Circular slide rules, resembling watches, are also made. The slide-rule principle is also employed in instruments used to work out specific problems, such as the flow of water in pipes, or the strength of beams. Such *computers* may be either like the ordinary slide rule, with scales in terms of the factors involved, or, as in the various Cox computers, there may be a founda-

lion plate, revolving disk, revolving segment, and index or pointer, with proper scales. The various slide rules proper all depend on the mechanical use of logarithms, and the scales are graduated on a logarithmic basis. By referring to the article LOGARITHMS, the operation of a simple slide rule will readily be understood, as the various graduations correspond to the logarithmic functions, and the appropriate length of each is determined from a table of logarithms. The figures inscribed on the scales, however, are those of the numbers corresponding to the logarithms. For example, to multiply 2 by 2, the number 2 on the scale is brought opposite the number 2 on the second scale, and, as a result, the zero of the latter is distant from the zero of the first by an amount equivalent to the sum of the two logarithmic graduations. The number corresponding to the point at which the zero or indicator stands is, of course, the product, which in this case is 4. The complexity of the problems which may be solved with the aid of the slide rule varies with the different rules; but, in general, it may be said that all problems involving multiplication and division may be solved by any of them, including powers, roots, and proportions, simply by setting the rule and reading off the indicated result. By providing scales with trigonometrical instead of arithmetical functions, the uses of the slide rule may be increased greatly, and often the two classes are engraved on reverse sides of the smaller slide rules. The rule is particularly valuable where the same operation is to be repeated many times, as in computing percentages, or where many long and wearisome calculations are to be made.

The improved calculating instruments of Slo-nimsky (1844) and Lucas (1885) effect multiplication without the supplementary addition required by Napier's rods. Quotients and remainders, in the case of division, are likewise fully determined by Genaille's instrument. Instruments in which mechanisms are combined for both addition and multiplication are sometimes called *arithmographs*. Rous (1869) constructed an apparatus of this kind, combining a set of Napier's rods with the abacus. More perfect forms are those of Th. von Eesersky (1872), Troncet (1891), and Bollée (1895). These form the border line between the elementary reckoning apparatus and the more elaborate calculating machine. As numbers are essential to reckoning, so number mechanism is the basis of calculating machinery. This mechanism is arranged for the decimal system, and combines elements for the various powers of 10. The elements are usually cylindrical disks, on whose plane or curved surfaces are placed the figures 0, 1, 2, . . . 9, once or several times. Whatever the arrangement of these number disks, their axes of rotation may be parallel and lie in a plane, or may form the elements of a cylindrical surface, or may coincide so that the numbers are beside one another on a common cylinder. This last arrangement, which seems to have appeared for the first time in the machine of Périere (1750), is preferred, because it requires the least space and brings the figures into close proximity. In every calculating machine the mechanism automatically carries over from any order to the next higher. Whenever a number disk is rotated so that it points to the figure 9, any further movement also moves the disk of

the next order; that is, for every ten-place rotation of any desired number disk, the next disk rotates one place. For addition, it is only necessary that each element of the number mechanism admit of being moved forward independently one or more figures. For subtraction, the older machines generally contain rows of red figures arranged in reverse order, so that the motion of the disk may still take place in the same sense. It is immaterial whether this motion be produced directly by the hand or indirectly by a lever; but it makes a difference in the rapidity of the work whether different figures of the same rank are added by the movement of one and the same element, or by the motion of different elements. To the first group belongs the oldest of all calculating machines, the *machine arithmétique* of Pascal (1642), designed for adding and subtracting. The modern machines of Roth (1843) and Webb (1868), and Orlin's *automatische Schraubenrechenmaschine* (1893), are modifications of the *machine arithmétique*. The necessary speed and accuracy of movement have been gained by the introduction of keys, as in the machines of Stettner (1882) and Mayer (1887). A key being provided for the numbers from 1 to 9, in the various orders, one has to fix the eye upon the numbers of one figure only. The latest improvement is a contrivance for automatically printing both the addends and their sum, thus leaving little to be desired in the form of an addition instrument. This is a feature of Burrough's registering accountant (1888) and Carney's cash register. Goldman's 'arithmachine' (1898) is one of the latest of the simple and practical machines.

In order mechanically to effect repeated addition—that is, multiplication—a rack or special carrying apparatus is necessary. This device makes it possible by a single motion of the hand, as the rotation of a crank, to carry simultaneously the set of number disks over a desired number of places. Four methods have been devised for this, but the most common is the *stepped reckoner* of Leibnitz, a cylinder with nine teeth of different lengths, corresponding to units, tens, etc. Another means also known to Leibnitz, and lately coming into favor, is the use of toothed wheels, whose teeth may be shoved in at will, thus rendering the wheels inoperative. Among the instruments of this type, with slight modifications, are the arithmometer of Thomas (1820), the machine of Maurel and Jayet (1849), and the arithmometers of Odhner (1878) and Küttner (1894). The *machine à calculer* of Bollée (1888), designed especially for multiplication, operates on a new principle. The products of numbers from 1 to 9 are represented by pairs of pegs, whose lengths correspond to the units and tens of the products. The pegs limit the freedom of the rack, which can be so moved that the product of the multiplicand by each figure of the multiplier is carried over to the addition machinery. In the calculating machine of Steiger (1892) partial products are expressed by pairs of disks, and in Selling's *elektrische Rechenmaschine* (1894) by electro-magnets. These machines are defective in that the multiplication must be performed step by step, using a multiplier of one figure only. They are made to perform division by moving a lever, which reverses the motion of the number disks. Much care has also been given to perfecting in-

struments having for their object the computing of mathematical and astronomical tables and the tabulation of functions. These are, in fact, the only means of producing thoroughly accurate tables. The idea practically originated with Müller (1786), but Babbage (1823) was the first to obtain valuable results with a machine of this kind. The machines of Wiberg (1863) and Grant (1871) are improved forms of this type. Babbage (1834) also invented an 'analytic engine,' designed to perform various analytic and arithmetical operations, but it was never completed.

The following machines of recent mention are extensively used; the first three are of German make and the last three American, the latter being the more practical: Beher's addition machine (1892), of keyboard type, limited to sums under 500; Illgen's calculator (1888), limited to sums under 1000; Runge's addition machine, Berlin (1896), adding numbers of several figures; Felt's comptometer, Chicago (1887), keyboard type, performing all four operations; Burrough's registering accountant, Saint Louis (1888), an addition machine of 81 keys, with a capacity of 2000 entries per hour, and automatically printing both the addenda and the total sum; Carney's cash register, Dayton (1890), an adding and printing machine of great perfection.

CASH-REGISTERS are a form of calculating machine in general use in retail stores, whose chief functions are to make a record of money received from sales of merchandise in a retail store, as the money is placed in the cash-drawer, and to add automatically this sum to the total previously placed in the drawer; it also indicates to the customers the record which has been made. The more complex cash-registers have been further developed so that it is possible to include an automatic record of other transactions which take place in a retail store, including credit sales and the separate sales of individual clerks or of particular lines of goods, so that they may be referred to at the close of the day's business.

The first practical cash-register was invented by James Ritty, of Dayton, Ohio, who secured his patent in 1879. In this first register the record was made on adding wheels and displayed by hands on a dial, but in later inventions the record is sometimes made by puncturing printed rolls of paper and is shown by indicators which rise and fall as the mechanism is operated, a number equal to the amount of the purchase rising as the cash paid is deposited in the drawer, the same operation causing the number which records the previous purchase to fall. In the 'detail adders,' manufactured by the National Cash Register Company, the mechanism is operated by pressing the proper registering key. A single pressure of the finger unlocks and throws open the cash-drawer, rings a bell, drops the indicator showing the last transaction, raises an indicator showing the amount of the new transaction, and at the same time records it on the adding wheels inside the register. Each registering key is connected with a corresponding adding wheel inside the register, which shows the total amount of registrations made on that key. For example, if the '5-cent' key be pressed five times its corresponding adding wheel shows a total of 25 cents. Thus the total amount of the day's sales can be ascertained at any time by

adding together the total amounts shown by the adding wheels. These registers can be arranged to keep separate record of 'charge,' 'received on account,' and 'paid out' transactions, or to show separately the receipts from different classes of goods. A drawer cannot be opened without making both an indication to the customer and an inside record under lock and key.

ELECTRIC TABULATING MACHINES, such as the one devised by Hollerith for recording and summarizing the United States census returns, may be classed under calculating machines. This apparatus is in three parts. The first operation is to punch holes in a card, corresponding to the facts to be recorded for each individual. The punches being operated from a keyboard of 240 characters. After the cards are punched they are fed into a machine, which, by means of the holes and certain electric devices, adds one to the total record for the fact indicated by each hole, such as sex, color, or age. Next the cards are placed in sorting boxes, in order to secure a combination of facts, such as the number of black persons who are married, and by means of electric connections which are acted upon only by cards having holes corresponding to the facts to be tabulated, the record is made.

For descriptions of calculating machines, consult: Mehmke, "Numerisches Rechnen," in *Encyclopädie der mathematischen Wissenschaften*, Vol. I. (Leipzig, 1901), containing numerous figures; Unger, "Einige Additionsmaschinen," *Abhandlungen zur Geschichte der Mathematik*, Vol. IX. (Leipzig, 1899); Shaw, "Theory of Continuous Calculating Machines," in *Phil. Transactions of Royal Society*, Vol. CLXXVI (London, 1885).

CALCULATORS (Lat. *calculator*, computer; see CALCULUS), REMARKABLE. Arithmetical prodigies, often spoken of as 'lightning calculators,' having an unusual capacity for combining numbers. The wonderful feats of these prodigies have been pronounced genuine by competent judges, although their psychological peculiarities have not been fully explained. Two peculiarities, however, seem characteristic of most of the known cases: an extraordinary memory for numerical combinations, and unusual methods of grouping numbers. That their ability is not entirely the result of special training is attested by the early age at which the power is manifested. Thus, at the age of 6, T. H. Safford computed mentally the number (617,760) of barley-corns in 1040 rods, and could extract the cube roots of numbers of 9 and 10 figures. Buxton solved the problem, to find the product of doubling a farthing 139 times, the result, expressed in pounds, being a number of 39 figures. Zerah Colburn, at 9 years of age, gave at sight the factors of 294,967,297, and in 20 seconds found mentally the number of hours in 1811 years. Raising 991 to the fifth power in 13 operations, and giving the product of any pair of two-figure numbers in $1\frac{1}{2}$ seconds, are feats accomplished by Arthur Griffith, who also memorized the squares of all numbers up to 130 and the cubes up to 100. Other noted prodigies are Annich, Bidder, Vinckler, Pughiesi, Mondeux, Magimelle, and Inaudi.

CALCULUS (Lat., a small stone, or pebble, which was used in reckoning, or calculations, by the Romans). A term applied in mathematics

o any method of treating problems by means of a system of algebraic notation. Thus, the Calculus of Forms (see FORMS) is a symbolic treatment of the properties of invariants; Imaginary Calculus is the method of calculating by the use of the imaginary unit (see COMPLEX NUMBER), and the Calculus of Quaternions (see QUATERNIONS) is the method of treating certain problems with the aid of the quaternion symbolism. Usually, however, the term is employed to designate the Differential and Integral Calculus, a branch of mathematical science affording, by one general method, a solution for many of the most difficult problems of pure and applied mathematics.

THE DIFFERENTIAL AND INTEGRAL CALCULUS. This is one of the most useful branches of mathematics. While elementary algebra and geometry deal with quantities whose value is fixed, the calculus investigates quantities whose value is continually changing. Considering that all nature in all its aspects varies continually, the importance of a mathematical method of dealing with variables is evident; and it is easy to see why science had made so little progress before the invention of the calculus, and why progress has been so rapid since.

Three simple examples may serve to show the kind of problems usually attacked by the calculus, and the manner in which it solves them. The first two of these examples can also, on account of their simplicity, be solved by means of elementary algebra, without resorting to the calculus. Nevertheless, they are typical calculus problems, and furnish as good examples of the calculus method as would be furnished by similar but much more complicated problems lying really beyond the power of elementary mathematics.

Problem I. Suppose the sum of two adjoining sides of a rectangle known. What must be the length of each side so that the rectangle may have the greatest possible area?

Problem II. A person in a boat 3 miles from the nearest point on a straight shore wishes to reach a place 5 miles away from that point. He can row 4 miles an hour and walk 5 miles an hour. Where should he land in order to reach his point in minimum time?

Problem III. To determine the work performed when a gas is compressed at constant temperature is one of the fundamental problems of theoretical engineering. Work is generally defined as the force required to move a body, multiplied by the distance traversed. In the case of a gas compressed in a cylindrical vessel, the body moved is the piston. If at the beginning of the experiment the pressure exercised on the pis-

ton is, say, p pounds per square inch of surface, and the area of the piston is a ; then $p \times a$ is evidently the force acting on the piston. This force, however, multiplied by the distance traversed by the piston during compression will not by any means give the work performed. For during compression the force will, of course, have to be continually increased; in other words, it will not retain its original value ap fixed, but will be a variable. In this case algebra and geometry fail to give a method of direct computation and the calculus has to be resorted to.

In order to understand how the calculus deals with problems of this nature, it is necessary to grasp clearly some fundamental ideas, which usually appear somewhat difficult to the beginner in calculus, just as the idea of any fixed number being represented by the letters a , b , c , appears difficult to the child first taking up the study of elementary algebra.

Fundamental Ideas: Function, Differential, Differential Coefficient, Limit.—Variables are represented in calculus by the Latin letters x , y , etc., or by the Greek letters ξ , ζ , etc., just as unknown quantities are represented in algebra. If the value of one variable continually depends on that of another variable, the first variable is said to be a *function* of the second, and the fact is denoted by writing: $y = f(x)$. Thus, the variable area y of a square is said to be a function of the variable length x of its side, and in this case the expression $y = f(x)$ stands for the equation $y = x^2$. In investigating the functions and their variables, the calculus catches them at a given moment for the purpose of determining the relative rate of their variation at that moment. Consider the motion of a ball thrown up in the air. Its velocity changes from instant to instant. We might get a rough idea of its motion by measuring the distance traversed during the first second, during the second second, during the third second, etc. But our results would be far from precise; for, however small an interval of time a second is, the velocity of our ball, changing continually, must be different at the end of that interval from what it is at its beginning. Our results would be even rougher if instead of the second we employed as a unit of time the minute. To render the results mathematically precise, we would have to take for our unit not a finite, but an infinitely small interval of time, an instant. The distance traversed during such an interval would be called the *differential* of distance and would be denoted in calculus by the symbol dl , if l stand for distance. Similarly, our infinitely small interval of time would be called the *differential* of time and would be denoted by the symbol dt , if t stand for time. But as this idea of what a differential is is somewhat vague, owing to the difficulty of actually conceiving something that is 'infinitely small,' the following considerations may be resorted to. Studying the motion of a ball thrown up in the air, we consider infinitely small intervals of time dt merely in order to be able to think of the motion as uniform; for within any finite interval the motion is variable. But if at a given instant the motion should actually become uniform, and continue so, we might think of our differential dt as representing any finite length of time, be it 5 minutes, or 10 minutes, or 500 minutes. For when a body moves with perfectly uniform speed, that speed may be readily determined by ascertaining the distance traversed during any interval of time whatever; the result is the same whether we divide the distance traversed in 5 minutes by 5, or that traversed in 10 minutes by 10. We may, accordingly, define the differential of distance dl as the distance that *would* be traversed by the ball in an arbitrary, finite interval of time, dt , beginning at a given instant, if at that instant the motion became uniform. In this manner we may avoid thinking of infinitely small quantities. The velocity would then be $dl \div dt$, no matter how

great or small dt is supposed to be. The ratio $\frac{dl}{dt}$ is called the *differential coefficient* of l with respect to t —the distance l being of course 'a function' of the time t . This ratio represents a *limit*. For, considering again the ball thrown up in the air, the error introduced by choosing a finite instead of an infinitesimal interval of time is the less the smaller an interval is chosen, and finally the true velocity $\frac{dl}{dt}$ is approached as a limit, when the interval of time becomes infinitely small. All this is concisely represented by a few symbols, as follows:

$$\lim_{\Delta t \rightarrow 0} \left(\frac{\Delta l}{\Delta t} \right) = \frac{dl}{dt}$$

In this expression Δt stands for some finite interval ('increment') of time, and Δl for the distance actually traversed during that interval. And the expression tells that when Δt approaches zero ($\Delta t = 0$), i.e. when it becomes infinitely small, the ratio $\frac{\Delta l}{\Delta t}$ approaches as a limit the value $\frac{dl}{dt}$. It need hardly be remarked that while dl and dt are themselves infinitesimal quantities, their ratio may have any finite value, large or small.

Maxima and Minima.—Since $\frac{dl}{dt}$ represents the velocity of the ball at any moment of the flight, it is evidently itself a variable quantity. For when, say, a rubber ball is thrown up in the air, the velocity of its motion becomes smaller and smaller until the highest point in its flight is reached; at that point the ball *pauses* for an instant and then begins to descend with increasing speed until it reaches the ground. Here it *pauses* again for an instant and then again goes up in the air. At the instant the ball is at the highest point, as well as at the instant it touches the ground, the velocity is therefore zero; i.e. $\frac{dl}{dt} = 0$. But as the two points reached by the ball are respectively the *highest* and the *lowest*, it may be said that when the function l has its maximum or minimum value, its differential coefficient with respect to its variable (i.e. $\frac{dl}{dt}$) is zero. This must be carefully remembered.

Bearing in mind the ideas explained in the preceding paragraphs, the problems cited at the beginning of the article may now be analyzed without any difficulty.

I. *Solution of the First Problem.*—In the problem of the maximum rectangle, let a be the known sum of two adjacent sides, let x be one of the sides, and let y be the area of the rectangle. Then $y = x(a - x)$, or $y = ax - x^2$.

Seizing the rectangle at some point in its variation, let us lengthen the side x by some finite amount, Δx , and suppose that this causes the area to increase by a finite amount, Δy . Our equation then becomes

$$y + \Delta y = a(x + \Delta x) - (x + \Delta x)^2 = ax + a\Delta x - x^2 - 2x\Delta x - (\Delta x)^2.$$

Subtracting the original equation, $y = ax - x^2$, we get

$$\Delta y = a\Delta x - 2x\Delta x - (\Delta x)^2,$$

and, dividing throughout by Δx ,

$$\frac{\Delta y}{\Delta x} = a - 2x - \Delta x.$$

Making Δx smaller and smaller without limit, it will ultimately approach zero. Then $a - 2x - \Delta x$ will become simply $a - 2x$, while the ratio $\frac{\Delta y}{\Delta x}$ will approach its limit $\frac{dy}{dx}$, and hence we will have

$$\frac{dy}{dx} = a - 2x.$$

Now, it was shown above that, at the instant a function passes through its maximum value, its differential coefficient is zero. Hence, when the area of our rectangle is the greatest possible, $\frac{dy}{dx} = 0$, and therefore, $a - 2x = 0$, or

$$x = \frac{1}{2}a.$$

But this tells us that each side must be one-half of the known sum, i.e. that the two adjoining sides must be made equal in order that the rectangle may have its maximum area.

The process just employed in solving the problem may be described as 'differentiating with the aid of the theory of limits.' Indeed, we started with the law that the area of a rectangle equals the product of two adjoining sides, a law expressed in our case by the equation $y = x(a - x)$. We then ascertained the ratio of the finite increment of area to an actual finite increment of the variable side x . Next we ascertained the limiting value of that ratio corresponding to an infinitely small increase of the side. This gave the value of the differential coefficient $\frac{dy}{dx}$ of our function as $a - 2x$. And as it had been shown before that the differential coefficient is zero at the point where a function has its maximum value, we wrote $a - 2x = 0$, which gave the value of the side x for that point.

By analogous processes of reasoning we may 'differentiate' any function whatever, and thus determine the form of its differential coefficient. In practical work, however, it is not necessary to go through the whole process every time a function is differentiated, and the differential coefficient of a function is usually obtained directly by the use of a few general formulas, the demonstrations of which are given in all text-books of calculus. In solving our other problems we will make direct use of two such formulas.

II. *Solution of the Second Problem.*—In the problem of the person in a boat, call A the point

where he must land in order to reach his point in the least time. An inspection of the accompanying figure shows that the distance of the boat from the point A is $\sqrt{3^2 + x^2}$ (hypotenuse of the right-angled triangle). To row this distance at the rate of 4 miles an hour requires $\frac{\sqrt{3^2 + x^2}}{4}$

hours, or, as it may be written, $\frac{(9 + x^2)^{\frac{1}{2}}}{4}$ hours. The distance of the landing point from the point of destination is denoted by $5 - x$. To walk this distance at the rate of 5 miles an hour requires $\frac{5 - x}{5}$ hours. The total time (call it

y) required to reach the point is therefore
 $y = \frac{(9 + x^2)^{\frac{1}{2}}}{4} + \frac{5 - x}{5}$ The question is, what

must be the numerical value of x in order that this expression for time may have the smallest possible value? As in Example I., the question may be answered by ascertaining the form of the differential coefficient $\frac{dy}{dx}$ and making it equal zero, so that it may correspond to the minimum magnitude of y . The result is as follows:

$$\frac{dy}{dx} = \frac{x}{4\sqrt{9+x^2}} - \frac{1}{5}$$

When y is a minimum, $\frac{dy}{dx} = 0$, and therefore,

$$\frac{x}{4\sqrt{9+x^2}} - \frac{1}{5} = 0,$$

whence $x = 4$. To reach the point of destination in minimum time, the person must therefore land 1 mile ($5 - 4 = 1$) from that point.

Differentiation and Integration.—It may be seen from the examples thus far discussed that the problem of the differential calculus is to obtain for every function considered the differ-

ential coefficient $\frac{dy}{dx}$; i.e. the rate of change of the function y with respect to its variable x . The process may also be described as follows: To differentiate a given magnitude, y , expressed in terms of its variable, x , is to obtain the value of the infinitesimal element dy in terms of the infinitesimal element dx of the variable x . The converse process, called integration, may be described as follows: To integrate means to obtain the function itself, when its rate of change with respect to the variable is given; i.e. to find y in terms of x when $\frac{dy}{dx}$ is given. The problem of the integral

calculus may also be stated in the following terms: To integrate is to find the magnitude y in terms of the variable x , when dy (an infinitesimal element of y) is given in terms of dx (an infinitesimal element of x). In the latter definition integration appears as a process of *summation*, the addends being an infinite number of infinitely small elements. The symbol of integration is $\int$ (the mediæval S, standing for *summa*). Thus, the symbol $\int dx$ indicates that it is required to integrate the differential of x .

The Constant of Integration.—Since a fixed (constant) quantity neither increases nor decreases, its *differential* is nothing at all. If, therefore, c denote any constant whatever, we may write $dc = 0$. For this reason the differential of $x + c$ is simply dx , the same as the differential of x . Comparing $x + c$ and x , we see that x is one of an infinite number of possible values of $x + c$; the latter, namely, equals x in the particular case where $c = 0$. When it is required to find in *general* the integral of dx , we therefore write not x , but $x + c$. So that $\int dx = x + c$. The constant c is then called the 'constant of integration,' and may either have a finite fixed value, or else may equal zero.

III. *Solution of the Third Problem.*—The last of the cited problems may now be attacked, viz. to determine the work performed when a gas is com-

pressed at constant temperature. The difficulty of this problem is in the fact that during compression the force is variable, i.e. it must be con-

tinually increased. If we were to suppose the force constant, we would, in calculating the work, commit the greater an error, the greater the amount of compression. But suppose the piston to be moved inward only an infinitely small distance. If we then calculate the work required, on the hypothesis that within that distance the pressure remains constant, we commit only an infinitely small error. In other words, our result is infinitely near the truth. Let dl therefore stand for an infinitely small distance traversed by the piston, let the area of the piston be a , and let the variable pressure be denoted by p . The work is then $padl$. But as adl is the volume of the infinitely small cylinder traversed by the piston, it may be denoted by dv and regarded as an infinitesimal element of our cylindrical vessel. The work is thus $p dv$.

To determine now the finite amount of work required to compress the gas from some initial volume, v_1 , to some final volume, v_2 , we will first answer the question: How much work would be required in compressing a given amount of gas from any volume v to unit volume? This is accomplished by 'integrating' $p dv$, i.e. by performing the operation denoted by the symbol $\int p dv$; and our result will be infinitely near the truth, because the error involved in assuming that the pressure p remains constant through the infinitesimal compression dv is infinitely small.

To integrate $p dv$ we must remember that at constant temperature the product of pressure and volume of a gas is constant: $pv = k$, whence $p = \frac{k}{v}$. Substituting this in $\int p dv$, we have $\int \frac{k dv}{v}$. Now $\frac{k dv}{v}$ might be shown, by the method of limit, repeatedly employed in this article, to be the exact differential of either $k \log v$, or $k \log v + c$, c being any constant. We may therefore write, conversely,

$$\int \frac{k dv}{v} = k \log v + c,$$

the constant of integration c being retained so as to give the solution its more general form.

The integral calculus has thus performed for us a wonderful task. Figuratively speaking, it employed a cylinder of volume v filled with gas and compressed it, an infinitesimal amount at a time, until unit volume was attained; it then summed up the infinitesimal amounts of work performed, and it has told us that the total amount of work done is $k \log v + c$. The result is algebraic, since v may have any finite value whatever. But to obtain a desired particular result, all we have to do is to substitute for v some numerical value. Further, the work performed in compressing the gas from some particular volume v_1 to some particular volume v_2 , evidently equals the *difference* between the work required to reduce the gas from volume v_1 to unit volume, and that required to reduce the gas from volume v_2 to unit volume. The required

work, W , between the limits v_1 and v_2 is, therefore,

$$W = k \log v_1 + c - k \log v_2 - c.$$

The limits being defined, this 'integral' is called a *Definite Integral*, and the operation is usually denoted as follows:

$$\int_{v_2}^{v_1} \frac{k dv}{v} = k \log v_1 - k \log v_2 = k \log \frac{v_1}{v_2}$$

The constant k , coming from the law $pv = k$, depends on the amount of gas employed and on the temperature at which the compression is carried out. It may, of course, be found by actually measuring the pressure and volume of the given amount of gas at the given temperature, and multiplying the pressure by the volume. By substituting in the above expression this value of k , as well as the numerical values of the initial volume v_1 and the final volume v_2 , involved in an actual compression, we will finally obtain the work which the problem required to calculate, and this is actually the way in which engineers determine that important quantity.

Another Way of Stating and Solving the Third Problem.—The relation $pv = k$ between the pressures and volumes of a gas whose temperature is kept constant (i.e. the law of Boyle and Mariotte) may be represented geometrically by a curve called an equilateral hyperbola, every point of the curve corresponding to a definite pressure and volume. (See ASYMPTOTE.) Further, it is shown in text-books of natural philosophy that the work performed in compressing the gas from an initial volume represented by the

line OA (see figure) to a final volume, OB, is represented by the area AA'B'B. The problem of determining the work may therefore be viewed as requiring to determine the area inclosed by the hyperbola and the axis OV between the limits OA = v_1 and OB = v_2 . To solve this problem the area AA'B'B may be imagined as made up of an infinite number of infinitely narrow strips. One such strip is roughly shown in the figure between the lines marked p and p' . The difference between p and p' would evidently be the greater, the greater the distance between them. But since the distance is supposed to be infinitely small, the two lines may be taken as equal and the strip may be considered as a rectangle. Calling its infinitely small base dv , the area of the rectangle is seen to be $p dv$. The total area AA'B'B may now be obtained by summing up the infinite number of 'differentials of area' like $p dv$ inclosed

between the limits OA = v_1 and OB = v_2 . The summation may be performed by the integral calculus and is denoted by a definite integral, as follows: AA'B'B = $\int_{v_2}^{v_1} p dv$.

We have seen before that the result of this integration is $k \log \frac{v_1}{v_2}$. The required area therefore equals the natural logarithm of the ratio

$\frac{OA}{OB}$, multiplied by the number (k) representing the product of any pair of coördinates, such as OB $\times$ BB', or OA $\times$ AA', etc. The calculus method is analogously employed whenever it is required to find the area inclosed by a given curve, elementary geometry being in most cases powerless to furnish the desired answer; and thus the calculus finds extensive application in the solution of many important problems of geometry.

The above sketch outlines the methods of reasoning by which the calculus attacks problems involving variable quantities. As to its limitations, it must be observed that while the differential calculus teaches how to differentiate readily any function whatever, the converse problem, viz. that of integrating a given differential, is often very difficult, requiring all manner of algebraic artifices, and is sometimes altogether impossible. In other words, in their studies of nature, scientists are often led to construct differentials (just as in our third problem we constructed the differential $p dv$) which they cannot integrate, because they can conceive no function which, on differentiation, would yield the given differential. Finally, it may be observed that the flour is no better than the grain, and if data that are made to pass through the mill of the calculus lead to doubtful results, it is the fault not of the calculus, but of the data; the calculus itself is as exact as any other branch of mathematics, in spite of the fact that the things it deals with seem so often to dwindle away into nothing.

HISTORY. The invention of the calculus method is generally referred to the latter half of the Seventeenth Century, but the course of its early development really leads much further back. Thus, the 'method of exhaustion,' which, as first applied, consisted in comparing the area bounded by a given curve with the area of an inscribed or circumscribed polygon whose number of sides is continually increased, is related to the present calculus through the doctrine of limits. Similarly, the surfaces of the sphere, cylinder, and cone were compared with prismatic and pyramidal surfaces. By this method Archimedes calculated the value of π , obtained the areas of the parabola, ellipse, and one of the spirals, and found the ratio of a spherical surface to the surface of the circumscribed cylinder. Kepler (1615) was the first to improve this method by introducing into geometry the idea of infinity. He considered the circle as composed of an infinite number of triangles (with their vertices at the centre and with their bases on the circumference), and the cone as composed of an infinite number of pyramids. The next advance is due to Cavalieri (q.v.), who effected quadrature by summing the infinitesimal elements into which be

divided his areas, and established the properties of the centre of gravity relating to solids of revolution. So far the end sought by mathematicians was the solution of particular problems, as the rectification and quadrature of certain curves. Thus, also, Wallis extended the application of Cavalieri's method of indivisibles, Descartes (1637) increased its power by the introduction of coördinate geometry (see ANALYTIC GEOMETRY), and Fermat applied it to maxima and minima (q.v.). But it remained for Leibnitz and Newton to devise a general notation and to organize existing principles into a comprehensive science. The principles of Newton, which later appeared under the title of *Fluxions* (q.v.), were first published in his *Principia* (1687). The basal idea of his calculus is that of velocity. A line, surface, or solid is conceived as generated respectively by a moving point, line, or surface. The velocity of a moving point, and its components along the axes of coördinates for successive intervals, were called fluxions. The velocity of the moving point was called the fluxion of the arc generated, and the arc the fluent of the point's velocity. The velocity of a moving point being regarded as constant, the ratio of its component fluxions determined the nature of the path described. In general, the relation between the fluxions being given, the relations between the coördinates of the point were sought, and conversely. An elementary change in velocity (fluxion) along the X-axis was designated by x' , $[x]$, or $\dot{x}$; along the Y-axis by y' , $[y]$, or $\dot{y}$. Leibnitz used the symbol dx instead of x' , a symbolism which has endured, while Newton's fluxional notation disappeared in the first half of the Nineteenth Century. The first publication of Leibnitz's principles appeared in the *Acta Erditorum* (Leipzig, 1684). His method differed from Newton's, not only in its symbolism, but also in its relation to pure number. The instantaneous changes in any continuously varying magnitude, regarded by Leibnitz as taking place by infinitely small differences, savor less of mechanics than do Newton's components of velocity. The basal idea, however, in the two systems is the same, and each calculus consists of two parts—(1) differential calculus, which investigates the rules for deducing the relation between the infinitely small differences of quantities from the relation which exists between the quantities themselves; (2) the integral calculus, which treats of the inverse problem, i.e. to determine the relation of the quantities when that of their differences is known.

The influence of calculus has been so extensive on nearly all branches of mathematics that no attempt will be made in what follows to give other than the most prominent names associated with its development. The theory of infinitesimals, which lies at the foundation of differential calculus, has received adequate treatment at the hands of Gauss, Cauchy, Jordan, and Picard. With the development of the general theory of functions are connected the names of Clairaut, D'Alembert, Euler, Lagrange, Gauss, Cayley, Cauchy, Riemann, Weierstrass, and Lie; with elliptic and Abelian functions the names of Landon, Jakob Bernoulli, Maclaurin, D'Alembert, Legendre, Clebsch, Abel, Jacobi, Eisenstein, and Brioschi; with the theory of the potential, Lagrange, Green, Gauss, Dirichlet, Riemann, Neumann, Heine, and Beltrami; with differen-

tial equations, the Bernoullis, Riccati, Clairaut, Euler, Lagrange, Monge, Cauchy, Clebsch, Boole, and Lie; and with the calculus of variations, Jakob Bernoulli, l'Hôpital, Lagrange, Sarrus, Cauchy, Hesse, Clebsch, and Weierstrass.

Calculus is essentially a branch of the science of number. It differs from other branches of this science, as arithmetic and algebra, by regarding number as continuous, i.e. as being capable of gradual growth and of infinitesimal increase, while they deal with finite and discontinuous number. It differs from ordinary algebra in another respect; in the latter, the values of unknown quantities, and their relations with one another, are detected by aid of equations established between these quantities directly; in the calculus, on the other hand, the equations between the quantities are obtained by means of other equations primarily established, not between the quantities themselves, but between certain derivatives from them, or elements of them. This is an artifice of great value, since the relations between the quantities involved in any problem can, in general, more easily be inferred from equations between their derivatives than from those between themselves.

CALCULUS OF VARIATIONS. The basis of this calculus is also a method of differentiation, but of a peculiar kind. In ordinary differential calculus we seek the form which $f(x)$ assumes when x receives an indefinitely small increment, dx . In the calculus of variations, we seek the laws of the changes attending a slight alteration of the form of the function, or in the transformation of one function into another. This calculus treats the so-called isoperimetrical problems, many of which were formerly insoluble. The method has extended application in higher physics.

CALCULUS OF FINITE DIFFERENCES is a calculus concerned with the changes of functions due to finite changes in the variables involved, hence without the assumption of continuity. E , Δ , and Σ are important symbols, E denoting the operation of increasing the independent variable of a function by unity, Δ the corresponding increment of the function, and Σ the summation of all values of the function for integral values of the variable from unity to any desired number.

CALCULUS OF OPERATIONS, as the term indicates, is a systematic method of treating problems by operating algebraically upon symbols of operation. If the symbols ϕ and ψ prefixed to a quantity represent operations of the same class, the law of operations is distributive (see DISTRIBUTIVE LAW) when $\phi(x + y) = \phi x + \phi y$; the law is commutative (see COMMUTATIVE LAW) when $\phi\{\psi(x)\} = \psi\{\phi(x)\}$. If ϕ^m represents the repetition of the operation ϕ m times, the law of indices in ordinary algebra is expressed by $\phi^m\{\phi^n(x)\} = \phi^{m+n}(x) = \phi^{n+m}(x) = \phi^n\{\phi^m(x)\}$.

These laws are true for differentiation, for

$$d_x(u+v) = d_x(u) + d_x(v), \text{ (distributive law)}$$

$$d_x\{d_y(u)\} = d_y\{d_x(u)\}, \text{ (commutative law)}$$

$$d_x^m d_x^n(u) = d_x^{m+n}(u), \text{ (index law).}$$

CALCULUS OF PROBABILITIES. A systematic analytic treatment of the doctrine of probability (q.v.) by use of the differential and integral calculus.

CALCULUS OF FUNCTIONS (q.v.). A systematic method of determining functions which satisfy given conditions.

CALCULUS, BARYCENTRIC. A method of treating geometric problems based on the mechanical theory of centres of gravity. In this calculus Möbius (1827) furnished the first example of homogeneous coördinates. See **COÖRDINATES**.

RESIDUAL CALCULUS. A branch of integral calculus due to Cauchy, in which the integration takes place around a contour inclosing points for which the function is infinite. The integral is called the residual, and in case the contour contains all the critical points, the integral is called the total or principal residual.

BIBLIOGRAPHY. The literature on the subject of calculus is so extensive that any limited selection of references must be unsatisfactory. The best selection of important works will be found in Meyer, *Encyklopädie der mathematischen Wissenschaften*, Vol. II. (Leipzig, 1900). Of the older works the most important are: Leibnitz, *Mathematische Schriften*, ed. by Gerhardt (Berlin and Halle, 1849-63); Newton, *Opuscula* (Lausanne, 1714); Euler, *Introductio in analysin infinitorum*, new ed. (Lausanne, 1848); id., *Institutiones calculi differentialis*, new ed. (Saint Petersburg, 1885); id., *Institutiones calculi integralis*, 3d ed. (Vienna, 1830). Of the later works may be mentioned those of Cauchy (Paris, 1821-47); Bertrand, *Traité de calcul différentiel et de calcul intégral* (Paris, 1864-70); Serret, *Cours de calcul différentiel et intégral*, 4th ed. (Paris, 1894); Hermite, *Cours d'analyse de l'école polytechnique* (Paris, 1873); Laurent, *Traité d'analyse* (Paris, 1885-91); and Jordan, *Cours d'analyse*, 2d ed. (Paris, 1893-96), which may be taken as typical of the best French works. In Germany and Austria, Schlömilch, *Compendium der höheren Analysis*, 4th ed. (Brunswick, 1895); Schlömilch, *Uebungsbuch zum Studium der höheren Analysis*, 4th ed. (Leipzig, 1888); Lipschitz, *Lehrbuch der Analysis* (Bonn, 1877-80); Stolz, *Grundzüge der Differential- und Integralrechnung* (Leipzig, 1893-99); and Riemann, *Gesammelte Werke*, edited by Weber and Dedekind, 2d ed. (Leipzig, 1892). In England, Price, *Treatise on Infinitesimal Calculus*, 2d ed. (4 vols., Oxford, 1855-89); Todhunter, *Differential Calculus* (Cambridge, 1865); and Todhunter, *Integral Calculus* (Cambridge, 1868), are widely known. Italy has recently produced a work of merit, viz., Pascal, *Lezioni di analisi infinitesimale* (3 vols., Milan, 1895). Of the American works covering the general field, Byerly, *Elements of Differential Calculus* and *Elements of Integral Calculus* (Boston, 1881), are representative. For the history of the subject, consult the *Encyklopädie* mentioned above; also: Cantor, *Geschichte der Mathematik*, Vols. II. and III. (Leipzig, 1892-98); Ball, *History of Mathematics*, 3d ed. (New York, 1901); Fink, *History of Mathematics*, translated by Beman and Smith (Chicago, 1900). The *Calculus of Variations* is treated historically, as well as mathematically, by Carll (New York, 1885).

CALCULUS, or STONE. In medicine, a hard concretion formed within the animal body, in consequence of the deposition in the solid form of substances which usually remain in solution. (See **CONCRETION**.) The concretions most commonly termed calculi are those formed in

the kidneys or bladder (urinary calculi), and those formed in the gall-bladder or biliary ducts (biliary calculi). Both of these give rise to very painful symptoms, and may even threaten life. Biliary calculi, or gallstones, may generally be presumed to exist when excessively severe pain suddenly arises in the right side, beneath the border of the ribs, and when in a few hours jaundice comes on, showing that some obstruction has existed in the outward flow of the bile. But the absolute proof that these symptoms depend on calculus is often wanting. The pain is, fortunately, transitory, but is more severe while it lasts than almost any other known form of suffering, unless it be that of a calculus in the kidney and ureter. It may be relieved by large doses of opium, but the remedy requires to be cautiously given, as even in medical hands fatal accidents have occurred. Gallstones, when impacted in the ducts, have sometimes proved fatal; but much more frequently they find their way, sooner or later, into the intestines. They are almost invariably composed of cholesterin (q.v.), with coloring matter and mucus arranged in layers in a semi-crystalline disposition. In size they vary from that of a small gravel to a diameter of over half an inch.

Urinary calculus occurs at all ages, but is most common in advanced life and in the male sex. It is very frequent in gouty persons, or among those who pursue sedentary occupations and live freely. It is rare among those who live much in the open air, or who take much violent exercise and use little animal food and wine. Among sailors it is peculiarly rare. In certain parts of England the disease is said to be frequent, as in Norfolk; and perhaps along the eastern coast of Scotland. In India, too, where some of the predisposing circumstances mentioned above can hardly be said to prevail, stone is by no means uncommon. The predisposing causes of calculus are still very imperfectly understood. In its early stages the condition usually presents itself in the form of gravel, shown by the passage of numerous very small portions of gritty concretion, which may be observed in the urine as a deposit like sand or like small grains of Cayenne pepper. When such deposits occur frequently—especially if they are present at the time of passing the urine, and not merely after it has cooled—there is reason to apprehend the subsequent formation of calculus. If, in these circumstances, there are pains of a dull character in the loins, with occasional sharper twinges, no time should be lost in seeking medical advice. If a fit of very severe pain should occur in a person for some time affected with gravel; if the urine becomes bloody; if agonizing twinges, commencing in the loins, radiate downward into the thigh or the groin, it is probable that a stone has already formed in the kidney, and is being displaced toward the bladder. Calculus in the bladder is at first attended with little suffering, as compared with that caused by the stone in its passage downward from the kidney; but unless removed or evacuated, the calculus is sure to enlarge, and it then becomes the cause of one of the most painful diseases that afflict humanity. The existence of a stone in the bladder, however, should never be assumed without a surgical examina-

tion, as all the symptoms are deceptive in certain cases. The most striking (and, perhaps, the most trustworthy) evidence of stone in the bladder, apart from the testimony of the sound (see LITHOTOMY), is smarting and burning pain experienced after the bladder has been emptied, together with occasional temporary stoppage in the flow of urine. The correct appreciation of all the symptoms, however, demands the familiarity with such cases that comes from surgical experience.

The chief varieties of urinary calculus, with respect to chemical composition, are: (1) Uric acid (red deposit); (2) urates of ammonia, soda, lime, etc. (brick-dust sediment); (3) phosphates of ammonia and magnesia, lime, etc.; (4) oxalate of lime; (5) carbonate of lime (chiefly in domestic animals); (6) cystin; (7) xanthic oxide (a very rare form, discovered by Dr. Marcet). Calculi are frequently found to be composed of numerous successive layers, each having a perfectly distinct chemical composition. Urates and phosphates in particular frequently succeed each other, and form what is called an alternating calculus. When calculus has once fairly formed in the urinary passages, no absolute cure exists except the removal of it, if possible, from the body (see LITHOTOMY; LITHOTRITY; and NEPHROTOMY); but in the stage of gravel, and still more in the earlier stages detected by careful examination of the urine, much may be done to check the tendency to this distressing and dangerous malady. The chief remedies consist in careful regulation of the diet and mode of living, together with the use of solvents adapted to the particular form of deposit found to be habitually present. Consult Park, *Surgery by American Authors* (New York, 1901). See URINE.

CALCUTTA (Hind. *Kali Ghāt*, the *ghāt*, or landing-place leading to the temple of the goddess Kali). The capital of the Province of Bengal and metropolis of British India, situated on the left bank of the river Hugli, an arm of the Ganges, in latitude $22^{\circ} 35' N.$, and longitude $88^{\circ} 27' E.$, about 100 miles from the sea by the river (Map: India, E 4). Calcutta is the headquarters of the Governor-General of India, and the seat of the Indian Government, also of the supreme courts of justice, of the court of appeals, and of a United States consulate. The appearance of the city, as it is approached by the river, is very striking. On the left are the Botanical Gardens and the Bishop's College, a handsome Gothic edifice, erected by the Society for the Propagation of the Gospel in Foreign Parts; on the right is the suburb of Garden Reach, with its handsome country seats and beautiful gardens; farther on are the Government dockyards and the arsenal; beyond these are the Maidan Esplanade, the favorite place of resort of the elite of Calcutta for their evening drive, the Eden Gardens, with their beautiful tropical trees and plants, and the splendid zoölogical gardens.

Here, near the river, lies Fort William, the largest fortress in India, occupying, with the outworks, an area of about half a mile in diameter. It is garrisoned by European and native soldiers, mounts 619 guns, and its armory contains 80,000 stands of small arms. Facing the esplanade, among other fine buildings, is the Government

House, a magnificent palace erected by the Marquis of Wellesley. Beyond this, extending northward along the river-bank, is the Strand, two miles in length, and forty feet above low water, with various ghats, docks, and landing-stages for ocean liners. It is adorned with many fine buildings, including the custom-house, the new mint, and other Government offices; and the appearance given by these and other edifices has gained for Calcutta the appellation of 'City of Palaces.' Among its other places of interest mention may be made of the principal court of justice, the town hall, a fine building, the Bengal and United Service Clubs, Writers' Building, Bank of Bengal, Jesuits' College, medical college, university, the Indian and the Economic museums, theatres, the Y. M. C. A. Building, besides various churches, mosques, Hindu temples, and pagodas, and numerous bazars. There are a number of monuments throughout the city, the most notable being those erected to the Marquis of Wellesley and Sir David Ochterlony. While the European quarter of the town is distinguished for its fine public buildings and commodious dwelling-houses, the quarters occupied by the natives present a very different appearance, their houses being, in most instances, built of mud, or bamboo and mats, and the streets narrow and unpaved. The cyclone of November, 1867, and that of June, 1870, while very destructive—in the first instance destroying 30,000 native houses—made room for considerable improvement. New and wider streets have been opened through crowded quarters and brick houses are replacing the huts.

In 1852 Calcutta was erected into a municipality, the proprietors paying assessments, and electing commissioners to apply the proceeds of these assessments in cleansing, improving, and embellishing the town. The water-supply of Calcutta is good. Formerly the water was kept in large tanks, interspersed throughout the city, whence it was borne by water-carriers or bahisties in large leather bags. Since the year 1865, however, excellent water has been obtained from the Hugli, about 15 miles above Calcutta, where it is filtered and sent down by pipes in the usual way. The works were further improved after 1888, and now yield a daily supply of 20,000,000 gallons. The result of this and of a system of underground drainage with an outlet in the Salt Lake has been a marked improvement in the health of the city, although more is to be desired in this direction, one-fourth of the wards remaining unsewered. A few progressive wards dispose of garbage by modern incinerators. Gas and electric lighting have taken the place of the oil lamps formerly in general use, and there are many miles of street-car lines. A canal girds a part of the city beyond the circular road.

The principal scientific and literary societies of Calcutta are the Bengal Asiatic Society, founded in 1784 by Sir W. Jones, possessing a fine library, and a valuable and extensive museum; the Bethune Society, for the promotion of intercourse between European and native gentlemen; the Dalhousie Institute, for the literary and social improvement of all classes of the community; the Bengal Social Science Association. The University of Calcutta was founded in 1857, on the same basis as the London University, and exercises functions over Bengal, the Northwest Provinces, Oudh, and the Central Provinces. Col-

leges have been instituted to prepare intending students. Other educational institutions are numerous in Calcutta. There are an engineering college and four Government colleges. The principal places for religious instruction are Bishop's College, intended chiefly for the education of missionaries and teachers, and the institutions of the Established and Free Churches of Scotland for the same purpose.

The communications of Calcutta afford great facilities for its extensive commerce. There are several lines of railway connecting it directly with Khulna in the delta; with Goalanda, an important centre of steamship traffic on the Brahmaputra; with Darjiling in the Himalayas, and with Diamond Harbor and Port Canning. The lines to northwest India and to Bombay start from Howrah, on the opposite side of the Hugli. Calcutta has telegraphic connection with the principal towns of India and communicates with Europe by several lines. Continuous communication, greatly facilitated by the Suez Canal, is kept up with Great Britain by numerous well-appointed steamers and sailing vessels. The river adjacent to the city varies in breadth from a quarter of a mile to nearly a mile. There are dry docks and wet docks. The city has water communication in three directions—to the east by various rivers leading to the Brahmaputra; to the north by the Hugli and the Nadiya rivers leading to the Ganges; to the west by the Midnapur Canal. The port has excellent anchorage and is the lowest of several seaports on the Hugli, which is navigable by sea-going vessels. The port extends for about 10 miles along the river and is somewhat less than 2 miles in breadth at its broadest part, the area being about 8 square miles, and comprised for the most part between the rivers and the circular road, a spacious roadway which marks the landward boundary of the city proper. Beyond this road there lie extensive suburbs, the chief of which are Chitpur, on the north; Nundeu Baugh, Bahar-Simleah, Sealdah, Entally, and Baliganj, on the east; and Bhawaripur, Allipur, and Kidderpur, on the south. The municipality of Howrah, situated on the opposite side of the river and connected with Calcutta by a pontoon bridge, contains the salt-golahs or warehouses of the Government, extensive manufactories, dock-yards, ship-building establishments, and the depot of the East India Railway.

One-third of the whole trade of India passes through Calcutta. The exports are jute, opium, cotton, rice, wheat, sugar, indigo, coffee, tea, saltpetre, linseed, shellac, buffalo-horns, hides, castor-oil, cutch, gunny bags, etc. As a central depot for the richest parts of India, Calcutta has an extensive inland trade. The principal industrial establishments include sugar-refineries, cotton-manufactories, flour, saw, and oil mills, and ship-building docks. Several newspapers are published. There are a few banks and numerous insurance and other companies, with a chamber of commerce. Living is comparatively cheap, and most of the luxuries of life, as well as its necessities, are to be had as readily as in most European towns. The annual fall of rain averages 64 inches; the temperature in the shade ranges in July from 78° to 87°, and in December from 60° to 79°. In 1837 the population of the town proper amounted to 229,700; it had increased by 1881 to 447,601; in 1891 to 861,764, with sub-

urbs (excluding Howrah, which had 116,606); and in 1901 to 1,121,700, when Howrah also had 157,850. Besides these, thousands of the 3,500,000 who sleep at night in the surrounding districts of Hugli and the twenty-four suburban Parganas flock during the day to Calcutta on foot, by boat, or by railway, to their daily toil. The inhabitants are mostly Hindus and Mohammedans. The Christians number only about 30,000. There is a considerable number of Europeans and of Eurasians, with some Armenians, Greeks, Jews, Parsees, and negroes. Calcutta was the birthplace of William Makepeace Thackeray.

Calcutta was founded by Governor Charnock in the year 1686, by the removal hither of the factories of the East India Company. In 1700 three villages surrounding the factories having been conferred upon the company by the Emperor of Delhi, in recognition of a present made to Azim, a son of Aurungzebe, they were forthwith fortified and received the name of Fort William in honor of the reigning King; but the place was subsequently termed Calcutta, the name of one of the villages. In 1707 Calcutta had acquired some importance as a town, and was made the seat of a presidency. In 1756 it was unexpectedly attacked by Surajah Dowlah, the Nawab of Bengal, and compelled to yield after a two days' siege; 146 men fell into the enemy's hands, and these were cast at night into the notorious 'Black Hole' (q.v.), only 23 surviving the horrors of that night. The city remained in the hands of the enemy until eight months afterwards, when Clive, in conjunction with Admiral Watson, recaptured the place, and afterward concluded peace with the Nawab. Soon after this and subsequent to the decisive victory of Plassey, the possessions of the East India Company were greatly extended by means of grants made by the Emperor of Delhi, and Calcutta once more resumed its career of progress and prosperity. Consult Stevens, "The Port of Calcutta," in Vol. XLVII., *Society of Arts Journal* (London, 1899); Stevenson, "Calcutta," in *Outing*, Vol. XXXI. (New York, 1900).

CALDANI, kál-dá'né, LEOPOLDO MARC ANTONIO (1725-1813). An Italian anatomist, born in Bologna. In 1771, on the death of Morgagni, the celebrated anatomist of Padua, Caldani was chosen his successor in the professorship. At the age of 76 he published his principal work, *Icones Anatomicae*, a series of anatomical plates. He also published *Institutiones Physiologicae* (1772) and other works.

CALDARA, kál-dá'rà, ANTONIO (1678-1736). An Italian composer, born in Venice. He studied there under Legrenzi and became a singer in the Chapel of San Marco. In 1714 he was appointed *maestro di cappella* in Mantua, and from there went to Vienna, where Charles VI. made him one of his vice-chapelmasters and took lessons from him. Caldara is noted rather for the quantity than the quality of his works. He was a most prolific composer for the stage and the Church, and his orchestration was often very elaborate. His compositions include 69 operas and oratorios, and numerous purely religious productions, the most celebrated of which is a *Crucifixus* (1840) for sixteen voices.

CALDARA, POLIDORO. See CARAVAGGIO.

CALDAS, kál'dás (Sp. plur. of *caldá*. Lat. *calida*, warm water, Lat. *calidus*, hot). A Span-

ish term for warm springs applied to numerous places on the Iberian Peninsula on account of their thermal springs. The chief of them are Caldas de Malavella, Caldas d'Estrach, and Caldas de Montbuy, in Catalonia; Caldas de Reyes, Caldas de Taipas, Caldas de Faveios, Caldas de Rainha, Caldas de Gerez, in Portugal. The name is also common in the topography of South America, as Caldas de Minas Geraes, Brazil.

CALDAS, FRANCISCO JOSÉ DE (c.1770-1816). A South American naturalist, born at Popayah, New Granada. He traveled extensively through that country and Peru, and in 1804, by means of a barometer and a sextant constructed by himself, measured Mount Chimborazo, Mount Tungueragua, and several other peaks. He was in charge of the observatory established at the beginning of the century at Santa Fé de Bogotá, and his valuable observations were published in the *Semenario de la Nueva Granada*, the first number of which was issued in 1807 (republished by A. Lasserre, Paris, 1849). Upon the outbreak of the revolution of 1810, Caldas embraced the cause of independence, was condemned to death by Morillo, and executed.

CALDAS-BARBO'SA, DOMINGOS (1740-1800). A Brazilian poet. He was born in Rio de Janeiro, and was the son of a freed negress. He entered the army, participated in the siege of Colonia do Sacramento in 1762, and afterwards went to Lisbon, where he took holy orders. His great improvisational gifts made him a favorite with the best society of Lisbon. His poems are tinged with melancholy and are somewhat pessimistic in tone. Many of them have been collected and published under the title, *A Viola de Loreno*.

CALDECOTT, kəl'de-kot, RANDOLPH (1846-86). An English illustrator, born in Chester. In early life he was a bank clerk; as an artist he was self-taught. About 1871 he went to London, and a year afterwards settled there, and began regularly to contribute drawings to the leading magazines. His first illustrations were done for Washington Irving's *Old Christmas* (1875). Among others are those for Irving's *Bracebridge Hall* (1876), and for books by Mrs. Ewing and Mrs. Locker. But his best work is a series of children's picture-books, illustrated in color. The series began with *John Gilpin* (1878), and ended with *The Great Panjandrum Himself* (1885). His depiction of country life and animals rivals Leech in humor and draughtsmanship.

CALDERA, kəl-dā'rā (Sp., kettle, Engl. *cal-dron*, referring to the hollow depression of volcanic origin). A seaport of Chile, in the Province of Atacama (Map: Chile, C 9). It has an excellent harbor, protected by breakwaters; and exports silver and copper, being the port for the productive mining district centring at Copiapó, with which it is connected by rail. There are silver and copper smelters here. The town is the seat of a United States consular agent. Population, in 1895, 1878.

CALDERON, kəl'dā-rōn', DON SERAFIN ESTÉBANEZ (1801-67). A Spanish poet and novelist. He was born in Malaga, December 27, 1799, studied law at the University of Granada, and in 1822 became professor of poetry and rhetoric there. A volume of poems which he published shortly after procured for him some distinction.

VOL. III.—48.

Subsequently, he became an advocate in his native city, but still continued faithful to the Muses. In 1830 he went to Madrid, where he published anonymously his only volume of poems under the title *El solitario* (1831). He also wrote several articles on Andalusian manners for the *Cartas Españolas*, the only literary journal at that period in Spain. In 1836 he was appointed Civil Governor of Logroño, but an accident obliged him to return to Madrid, where he devoted himself to collecting MSS. of the old national literature, to be the basis of a great critical edition of the *Cancioneros* and *Romanceros*. Calderon wrote also a fine novel, *Cristianos y Moriscos* (1838). To the literature of the Spanish Moors he paid great attention. His *Escenas andaluzas* (1847) are a series of lively sketches of Andalusian life. At his death, February 5, 1867, he left behind him a work on the *Expediciones y aventuras de los Españoles en Africa*. The Spanish Government purchased his very valuable library. Consult Cánovas del Castillo, *El solitario y su tiempo*, etc. (Madrid, 1883).

CALDERON, FRANCISCO GARCIA (1834—). A Peruvian statesman, born in Arequipa. He became professor of jurisprudence at the age of 21, was elected to the Peruvian Congress in 1867, and in 1868 became Minister of the Treasury. After the occupation of Lima by the Chilean Army in 1881, and the flight of President Piérola, Calderon was elected Provisional President of Peru. In this capacity he attempted to treat with the civilians and to secure the coöperation of the United States. These plans were frustrated by the Chileans, who sent him to Valparaíso as a prisoner. Upon his return to Lima in 1886, he became president of the Senate. He was influential in arranging the Grace contract, by means of which great improvements were made in the finances of Peru. His principal publication is the *Dictionary of Peruvian Legislation*.

CALDERON, kəl'dēr-on, PHILIPPE HERMOGÈNE (1833-98). An English subject and portrait painter of Spanish extraction, born in Poitiers. He studied with J. M. Leigh in London and with Picot in Paris, but established himself in London, where his first picture, "By the Waters of Babylon," was exhibited at the Royal Academy in 1853. Among his most noteworthy paintings are the following: "The Return from Moscow" (1861); "The British Embassy at Paris during the Massacre of Saint Bartholomew" (1863); "Joan of Arc" (1877); "Flowers of the Earth" (1881).

CALDERON, BRIDGE OF. See PUERTO DE CALDERON.

CALDERON DE LA BARCA, kəl'dā-rōn' dā lā bār-kā, PEDRO (1600-81). An eminent Spanish dramatic poet, next to Lope de Vega, Spain's greatest dramatist, and the most typically national Spanish writer of his century. He came of a good old family, and was born January 17, 1600, in Madrid, where his father was employed in the department of the treasury; was educated at the Jesuit college in that city, and tradition says, as it did of Cervantes, that he studied for a time in Salamanca. His first play was written at the age of 13, and at 22 he won a prize in a poetical contest which called forth warm praise from Lope de Vega. Ten years of

military service followed, in Italy and Flanders, though there is some discrepancy in dates. But in 1635 he is once more in Madrid, writing for the stage. Two years later he received the Order of Santiago, and in 1648 had to interrupt the composition of a play in order to join his fellow knights in a campaign against the Catalan rebels. In 1651 he followed the example of Lope de Vega and entered the priesthood, becoming successively chaplain at Toledo, honorary chaplain to Philip IV., and superior of the Brotherhood of San Peder in Madrid. Yet he still continued to write for the stage, and when he died, May 5, 1681, he was engaged upon a new *auto sacramental*, a form of religious play in which he excelled all his predecessors. His friend De Solis wrote of him, "He died, as they say the swan dies, singing."

With Calderon the golden period of Spanish drama comes to a close. He found it at its height, and he exhausted, one after another, the possibilities of its several types. As to the rank which should be assigned him, it must be borne in mind that he wrote not for the world, but for the narrow circle of his own age and country. He was essentially, fundamentally local; he lacked the universality, the wide humanity of Shakespeare, to whom, curiously enough, Friedrich Schlegel found him superior. He lacked the gift of finely differentiating his characters. They stand less for individuals than for personifications of certain primitive and dominant passions, love, hate, pride, charity, revenge. His leading motives are limited in number; they almost narrow down to the three sentiments of loyalty to the King, devotion to the Church and the 'point of honor,' or vengeance inflicted by husband, father, or brother upon an erring woman. Perhaps nothing serves better to illustrate his circumscribed outlook upon life than the plays in which this last theme is treated. His heroes have nothing of the lofty passion of an Othello, the sublimity of a noble nature gone astray. They impress one rather as cold-blooded executioners, sensitive only to the fear of being made to appear absurd. There is much significance in the fact that of all the surviving plays of Calderon, only three have been found capable of production on the modern stage.

Many critics think that Calderon was at his best as a writer of *autos*, or religious plays, which closely resemble the mystery plays of the Middle Ages, and in their more specialized form are a sort of dramatized exposition of the mystery of the blessed eucharist, intended for performance on Corpus Christi day. Of these *autos*, nearly eighty are extant, although the number varies in different authorities, who sometimes fail to distinguish between the *auto* and the more secular *comedia devota*. Of the regular dramas, there are about 120 surviving, of which the best known are *El Alcalde de Zalamea*; *El principe constante* (an historical play dealing with Prince Ferdinand of Portugal); *La dama duendo* (The Fairy Lady); *El médico de su honra*; *El pinto de su deshonra*; and *El mayor monstruo los zelos* (No Monster Like Jealousy).

Editions of Calderon are: Keil's (Leipzig, 1827); Hartzenbusch's (Madrid, Rivadeneyra, 4 vols., 1872-74); and Garcia Ramen (Madrid, 1882); a German translation of the plays, by J. D. Gries (9 vols., Berlin, 1862). There are English translations of selected plays by

M'Carthy (1854-73); Edward Fitzgerald (3 vols., 1853); Archbishop Trench (1856); and N. MacColl (1888). Consult: Schmidt, *Die Schauspielwerke Calderons* (Elberfeld, 1857); Trench, *Essay on the Life and Genius of Calderon* (London, 1880); Menendez y Pelayo, *Calderon y su teatro* (Madrid, 1881); Günther, *Calderon und seine Werke* (Freiburg, 1888).

CALDERON THE COURTIER. A story of Spanish romance by Bulwer Lytton (1838).

CALDERWOOD, kəl'dēr-wud, DAVID (1575-1650). A Scottish divine and ecclesiastical historian. He was born in Dalkeith, of a good family, and about 1604 was settled as Presbyterian minister of Crailing, Roxburghshire, a few miles southeast of Edinburgh. Opposed to the designs of James VI. for the establishment of Episcopacy in Scotland, on that monarch's visit to his native country in 1617, he and other ministers signed a protest against a bill, then before the Scottish Parliament, for granting the power of framing new laws for the Church to an ecclesiastical council appointed by the King, and in consequence he was summoned before the high commission of Saint Andrews. Refusing to submit, he was committed to prison for contumacy, and then banished the kingdom. He retired to Holland, 1619, and in 1621, in English, and in 1623, in Latin, published at Leyden, under the pseudonym Edwardus Didoclavus, an anagram on his name, Latinized, his celebrated controversial work, entitled *Altare Damascenum*, etc., in which he rigorously examined the origin and authority of Episcopacy, and which has been a storehouse of information and argument in favor of Presbyterianism. After King James's death, in 1625, he returned to Scotland, and for some years was engaged collecting all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the Reformation there to the death of James VI. In 1640 he became minister of Pencaitland, near Edinburgh, and in 1643 was appointed one of the committee for drawing up the Directory for Public Worship in Scotland. He died at Jedburg, October 29, 1650. From the original MS. of his *History of the Kirk of Scotland*, preserved in the British Museum, an edition, with a life, by the Rev. Thomas Thomson, was printed for the Woodrow Society, in 8 vols. (Edinburgh, 1842-49).

CALDERWOOD, HENRY (1830-97). A Scotch clergyman and philosopher, born at Peebles. He was educated at Edinburgh University in 1847-52, studied theology, 1852-56, and was minister of Greyfriars Presbyterian Church, Glasgow, in 1856-58. He was examiner in mental philosophy at the University of Glasgow from 1861 to 1864, and from 1868 until his death was professor of moral philosophy at Edinburgh University. He published *The Philosophy of the Infinite* (1854); *Handbook of Moral Philosophy* (1872); *The Relations of Mind and Brain* (1879); *The Relations of Science and Religion* (1881); and *Evolution and Man's Place in Nature*.

CALDICOTT, kəl'di-kot, ALFRED JAMES (1824—). An English musician and composer, born in Worcester. He studied at the Leipzig Conservatory under Richter, Moscheles, and others; became organist of Saint Stephen's Church, Worcester, and in 1882 was appointed to a professorship at the Royal College of Music, London. His

works include many songs and glees; the cantatas *The Widow of Nain* (1881) and *A Rhine Legend* (1883); and the operettas *A Moss-Rose Rent* (1883) and *Old Knockles* (1884).

CALDIERO, kál-dyá'rò (anciently Lat. *Caldarium*, hot baths, from *calidus*, warm). A decayed town in north Italy, 8 miles east of Verona. Its hot sulphur springs were known to the Romans, hence the name *Caldarium* (Map: Italy, 2). Here on November 12, 1796, the Austrians repulsed Napoleon, and on October 29-31, 1805, a series of bloody battles between the Austrians under Archduke Charles and the French under Masséna occurred.

CALDWELL, káld'wél. A town and county-seat of Warren County, N. Y., 62 miles north of Albany, the terminus of a branch of the Delaware and Hudson Railroad (Map: New York, G 2). A picturesque location, at the southern end of Lake George, amid mountain scenery, vies with historical associations in making the locality popular as a summer resort. Forts George and William Henry were located here. Population, in 1890, 1377; in 1900, 1465.

CALDWELL. A village and county-seat of Noble County, Ohio, 35 miles north of Marietta, on the Cleveland and Marietta and the Bellaire, Zanesville and Cincinnati railroads (Map: Ohio, H 6). It is a coal and iron mining, and oil-producing region. Population, in 1890, 1248; in 1900, 927.

CALDWELL. A town and county-seat of Bursleson County, Tex., about 85 miles east by north of Austin, on the Gulf, Colorado and Santa Fé Railroad (Map: Texas, F 4). It has a trade in the products of an agricultural and stock-raising region, and contains brick-yards, cotton-gin, grist and oil mills, marble-works, etc. Population, in 1890, 1250; in 1900, 1535.

CALDWELL, CHARLES HENRY BROMEDGE (1823-77). An American naval officer. He was born in Hingham, Mass., and entered the United States Navy in 1838. He took part in the bombardment of Forts Jackson and Saint Philip in 1862, and commanded the mortar flotilla in the operations at Port Hudson in 1863. In 1870 he became chief of staff in the North Atlantic Squadron. He reached the grade of commodore in 1874.

CALDWELL, JAMES (1734-81). An American clergyman, best known as 'the soldier's parson.' He was born in Virginia, graduated at Princeton in 1759, became pastor of the Presbyterian Church at Elizabethtown, N. J., in 1762, and was a zealous patriot during the Revolution. In 1780 the Tories burned his house and church, and soon afterwards a British force from Staten Island fell upon the village of Connecticut Farms (now Union, N. J.), where Caldwell's wife and children had taken refuge, and murdered his wife while she was praying with her children. The story is told of Caldwell's distributing hymn-books to some soldiers who were short of wading, with the exhortation, "Now, boys, put Watts into them." He was shot and killed by a patriot sentinel during a dispute about a package that the soldier declared it his duty to examine. The soldier was tried by the civil authorities for murder, and was convicted and executed. A fine monument to Caldwell was dedicated at Elizabethtown on the sixty-fourth anniversary of his death.

CALDWELL, SAMUEL LUNT (1820-89). An American educator. He was born in Newburyport, Mass., and graduated from Waterville (now Colby) College in 1839, and from Newton Theological Institution in 1845. He held pastorates in Bangor, Maine, and Providence, R. I., for twenty-seven years, and was professor of Church history at the Newton Seminary from 1873 to 1878. He then became second president of Vassar College, succeeding Dr. J. H. Raymond, and held this position until 1885.

CALEB (dog). The name both of an individual and of a Kenizzite clan, mentioned in I. Sam. xxv. 3; Num. xxxii. 12; Judges i. 15; I. Chron. ii. 9 *al.* It was probably of Edomitish origin. Before the time of David (c.1033-993 B.C.), it was established in Hebron and its neighborhood. Caleb ben Jephunneh is the eponymous hero of the clan, representing its advance from Arabia into the Negeb. In the story of the spies, Num. xiii. 6, it even represents Judah. Post-exilic genealogies connect Caleb closely with Jerahmeel, as a younger brother, and both through Hezron and Perez with Judah. It is possible that these genealogies reflect vaguely the outlines of a history, of which northwestern Arabia and the Negeb were the scenes, before the different elements were welded together into the kingdom of Judah by David.

CALEB. (1) The foster-mother of Saint George in the *Seven Champions of Christendom*. (2) A caricature of Lord Grey of Wark, in Dryden's *Absalom and Achitophel*.

CALEB WILLIAMS. A novel by William Godwin, published in May, 1794. It is a study in the relativity of ethics. For the plot, see FALKLAND. It was dramatized by Colman the Younger. See IRON CHEST, THE.

CALEDONIA (Lat., Gk. Καλῆδονία, *Kalēdonia*, still retained in Cymr. *Coed Celyddon*, Caledonian Forest). The name given to the northern part of Britannia, beyond the firths of Forth and Clyde, by Tacitus and the later Romans. The derivation is very uncertain. Agricola attempted the conquest of Caledonia, which he invaded in A.D. 80 and the following years. In 84 he defeated Galgacus, who had formed a union of all the tribes, but was prevented, by his recall, from pursuing the conquest. Later Hadrian, Septimius Severus, and others attempted to subdue Caledonia, but the inhabitants succeeded in maintaining their independence. The natives made constant incursions into Britain. In the Fourth and Fifth centuries, under the names of Scots and Picts (q.v.), they preyed upon the Britons, especially after the withdrawal of the Roman legions, until the island was occupied by the Angles and Saxons. See BRITANNIA, and SCOTLAND.

CALEDONIA, New. See NEW CALEDONIA.

CALEDONIAN CANAL. A chain of natural lakes in Scotland, 62 miles long, united by artificial canals and traversing the Great Glen of Albin, in Invernesshire, from northeast to southwest, and connecting the North Sea with the Atlantic. The lakes are Beauuly, Ness, Oich, Lochy, Eil, and Linnhe (Map: Scotland, D 2). They communicate by cuts 120 feet broad at the surface, 50 feet at the bottom, and 17 feet deep, the total length of these artificial channels being 23 miles. The canal was formed to avoid dangerous and tedious navigation by the Pentland

Firth, Cape Wrath, and the Hebrides; the distance between Kinnaird's Head and the Sound of Mull by this route being 500 miles, but by the canal 250, with an average saving of $9\frac{1}{2}$ days for sailing vessels. The highest part is Loch Oich, 105 feet above the sea. There are 28 locks, each 170 to 180 feet long, and 40 feet wide, with a rise or lift of water of 8 feet. Eight of the locks, called Neptune's staircase, occur in succession near the west end of the canal. Begun under Telford, in 1803, the canal was opened in 1823. Ships of 500 to 600 tons can pass through. It is chiefly used by fishing-boats and for local traffic, and in the summer season is much frequented by tourists attracted by the picturesque scenery and points of interest on both sides of the canal.

CALEDONIA SPRINGS. A health resort in Prescott County, Ontario, Canada, about 10 miles southwest of Original, and 60 miles nearly due west of Montreal (Map: Quebec, C 5). It is famous for its alkaline springs.

CALEF, or CALFE, ROBERT (c.1648-1719). A Boston merchant, who published, in 1700, *More Wonders of the Invisible World*, a satirical reply to Cotton Mather's *Wonders of the Invisible World* (1692). His argument against the witchcraft persecutions and his attack on Mather called out from the latter's parishioners, in defense of their pastor, *Some Few Remarks upon a Scandalous Book Against the Government and Ministry of New England*. Calef's book was also publicly burned at Cambridge by order of Increase Mather, then president of Harvard College.

CALENDAR (Lat. *calendarium*, account-book, interest falling due on the calends, from *calendæ*, calends). The mode of adjusting the months and other divisions of the civil year to the natural or solar year. The necessity of some division and measurement of time must have been early felt. The phases or changes of the moon supplied a natural and very obvious mode of dividing and reckoning time, and hence the division into months (q.v.; see also **WEEK**) of 29 or 30 days was, perhaps, the earliest and most universal. But it would soon be observed that, for many purposes, the changes of the seasons were more serviceable as marks of division; and thus arose the division into years (q.v.), determined by the motions of the sun. It was soon, however, discovered that the year, or larger division, did not contain an exact number of the smaller divisions or months, and that an accommodation was necessary; and various not very dissimilar expedients were employed for correcting the error that arose. The ancient Egyptians had a year determined by the changes of the seasons, without reference to the changes of the moon, and containing 365 days, divided into twelve months of 30 days each, with five supplementary days at the end of the year. The Jewish year consisted, in the earliest periods, as it still does, of twelve lunar months, a thirteenth being from time to time introduced, to accommodate it to the sun and seasons. This was also the case with the ancient Syrians, Macedonians, etc. The Jewish months have alternately 29 and 30 days; and in a cycle of 19 years there are 7 years having the intercalary month, some of these years having also one, and some two days more than others, so that the

length of the year varies from 353 to 385 days. The Greeks, in the most ancient periods, reckoned according to real lunar months, twelve making a year; and about B.C. 594 Solon introduced in Athens the mode of reckoning alternately 30 and 29 days to the month, accommodating this civil year of 354 days to the solar year by occasional introduction of an intercalary month. A change was afterwards made, by which three times in 8 years a month of 30 days was intercalated, making the average length of the year $365\frac{1}{4}$ days. See **METONIC CYCLE**.

The Romans are said to have had originally a year of 10 months; but in the time of their kings they adopted a lunar year of 355 days, divided into 12 months, with an occasional intercalary month. Through the ignorance of the priests, who had the charge of this matter, the utmost confusion gradually arose, which Julius Cæsar remedied (B.C. 46) by the introduction of the Julian Calendar, according to which the year has ordinarily 365 days, and every fourth year is a leap year of 366 days—the length of the year being thus assumed as $365\frac{1}{4}$ days, while it is in reality 365 days, 5 hours, 48 minutes, and 46 seconds; or 11 minutes, 14 seconds less. Cæsar gave the months the number of days they still have. See **CALENDS**.

So perfect was the Julian style of reckoning that it prevailed generally among Christian nations, and remained undisturbed till the accumulation of the remaining error of 11 minutes, or so had amounted, in 1582, to 10 complete days, the vernal equinox falling on the 11th instead of the 21st of March, as it did at the time of the Council of Nice, A.D. 325. This shifting of days had caused great disturbances, by unfixing the times of the celebration of Easter, and hence of all the other movable feasts. And accordingly, Pope Gregory XIII., after careful study, with the aid of Clavius, the astronomer, ordained that 10 days should be deducted from the year 1582, by calling what, according to the old calendar, would have been reckoned the 5th of October the 15th of October, 1582; and, in order that this displacement might not recur, it was further ordained that every hundredth year (1800, 1900, 2100, etc.) should not be counted a leap year, excepting every fourth hundredth, beginning with 2000. In this way the difference between the civil and natural year will not amount to a day in 5000 years. In Spain, Portugal, and part of Italy, the Pope was exactly obeyed. In France the change took place in the same year, by calling the 10th the 20th of December. In the Low Countries the change was from the 15th December to the 25th; but it was resisted by the Protestant part of the community till the year 1700. The Catholic nations, in general, adopted the style ordained by their sovereign pontiff; but the Protestants were then too much inflamed against Catholicism in all its relations to receive even a purely scientific improvement from such hands. The Lutherans of Germany, Switzerland, and, as already mentioned, of the Low Countries, at length gave way in 1700, when it had become necessary to omit 11 instead of 10 days. A bill to this effect had been brought before the Parliament of England in 1585, but does not appear to have gone beyond a second reading in the House of Lords. It was not till

1751, and after great inconvenience had been experienced for nearly two centuries, from the difference of the reckoning, that an act was passed (24 Geo. II., 1751) for equalizing the style in Great Britain and Ireland with that used in other countries of Europe. It was then enacted that 11 days should be omitted after the 2d of September, 1752, so that the ensuing day should be the 14th. A similar change was about the same time made in Sweden and Tuscany, and Russia is now the only country which adheres to the old style; an adherence which renders it necessary, when a letter is thence addressed to a person in another country, that the date should be given thus: April 13 or July 9.

It will be observed that the year 1800, not being considered by us as a leap year, has intersected another, or twelfth, day between old and new style.) See CHRONOLOGY; DATE.

FRENCH REVOLUTIONARY CALENDAR. The French nation, in 1793, undertook the task of making a new calendar, professedly upon philosophical principles. The new era was dated from the minute of the autumnal equinox (September 22, 1792), which was also the day from which the existence of the Republic was reckoned (although the formal proclamation of the Republic was on September 21). There were 12 months of 30 days each, divided into decades, in which the days were named numerically—Primi, Duodi, and so on, up to Decadi. The remaining five days were grouped as festival days at the end of the year, and known as *Sansculottides*. The months, seasons, and festivals were arranged

as follows (the table being for the years I., II., III., V., VI., VII., the dates varying by one or two days in the remaining years):

AUTUMN.	
Vendémiaire.....	Vintage month.....22 Sept. to 21 Oct.
Brumaire.....	Fog month.....22 Oct. to 20 Nov.
Frimaire.....	Sleet month.....21 Nov. to 20 Dec.

WINTER.	
Nivôse.....	Snow month.....21 Dec. to 19 Jan.
Pluviôse.....	Rain month.....20 Jan. to 18 Feb.
Ventôse.....	Wind month.....19 Feb. to 20 Mar.

SPRING.	
Germinal.....	Seed month.....21 Mar. to 19 April
Floréal.....	Blossom month.....20 April to 19 May
Prairial.....	Pasture month.....20 May to 18 June

SUMMER.	
Messidor.....	Harvest month.....19 June to 18 July
Fervidor, or Thermidor.....	Heat month.....19 July to 17 Aug.
Fructidor.....	Fruit month.....18 Aug. to 16 Sept.

SANS-CULOTTIDES, OR FEASTS DEDICATED TO	
Les Vertus.....	The Virtues.....17 Sept.
Le Génie.....	Genius.....18 Sept.
Le Travail.....	Labor.....19 Sept.
L'Opinion.....	Opinion.....20 Sept.
Les Récompenses.....	Rewards.....21 Sept.

A sixth additional day in leap years was named *le jour de la Révolution*. This calendar was a product of the revolt against Christianity, and it existed until the old system was restored by Napoleon, December 31, 1805. See CHRONOLOGY.

PERPETUAL CALENDAR. An arrangement for ascertaining the day of the week corresponding to any desired date, and for solving other similar problems. The following form of perpetual calendar was arranged by Capt. J. Herschel, and is probably the best yet devised. As here given, it covers the period from 1798 to 1950, but it can be extended easily in either direction.

Every date is composed of four elements, viz.:

- (1) Day of the week.
- (2) Day of the month.
- (3) Name of the month.
- (4) Number of the year.

Any three of these elements being given, we can find the fourth from the perpetual calendar. Thus, suppose we wish to find what day of the week corresponded to March 4, 1865, on which day Lincoln was inaugurated President of the United States for the second time. Entering the calendar in the column headed 'March,' and opposite the 'day of the month' 4, we find the sign +. Now, entering the column containing the year 1865, and going up it to the same sign +, we find opposite that sign, on the right, the 'day of the week' Saturday. Accordingly, Lincoln was inaugurated on a Saturday.

Again, suppose it is required to find in what years

PERPETUAL CALENDAR

DAY OF THE MONTH					Jan. Oct.	Apr. July Jan.	Sept. Dec.	June	Feb. Mar. Nov.	Aug. Feb.	May	
1	8	15	22	29	x	+	=	•		‡	§	Monday
2	9	16	23	30	§	x	+	=	•		‡	Tuesday
3	10	17	24	31	‡	§	x	+	=	•		Wednesday
4	11	18	25	32		‡	§	x	+	=	•	Thursday
5	12	19	26		•		‡	§	x	+	=	Friday
6	13	20	27		=	•		‡	§	x	+	Saturday
7	14	21	28		+	=	•		‡	§	x	Sunday
1798 1804 1810 1811 1816 1821 1827 1832 1838 1844 1849 1855 1860 1866 1872 1877 1883 1888 1894 1900 1906 1912 1917 1923 1928 1934 1940 1945 1799 1805 1811 1816 1822 1828 1833 1839 1844 1850 1856 1861 1867 1872 1878 1883 1889 1894 1900 1906 1912 1918 1924 1929 1935 1940 1945 1800 1806 1812 1818 1823 1829 1834 1840 1846 1851 1856 1862 1868 1873 1879 1884 1890 1896 1902 1908 1914 1920 1925 1930 1936 1941 1947 1801 1807 1813 1819 1824 1829 1835 1840 1846 1852 1857 1863 1868 1874 1879 1885 1891 1896 1903 1909 1915 1921 1926 1931 1937 1942 1948 1802 1808 1814 1819 1824 1830 1835 1841 1847 1852 1858 1864 1869 1875 1881 1886 1892 1898 1904 1910 1916 1922 1927 1932 1938 1943 1949 1803 1809 1815 1820 1825 1831 1836 1842 1847 1853 1859 1864 1870 1876 1881 1887 1892 1898 1904 1910 1916 1922 1927 1932 1938 1944 1950												

NOTE

The *italic* months are for use in bissextile years only. No attention need be paid to leap years, unless the date falls in January or February.

March 4 (inauguration day) can fall on a Sunday. As before, for March 4 we find the sign +. Opposite Sunday we find that sign in the first column of years, beginning with 1798, 1804, etc. In all the years in this column, therefore, March 4 will fall on a Sunday. But Presidential inaugurations usually occur only in years following leap years, which latter are indicated by *italics* in the perpetual calendar. Consequently, Sunday inaugurations occurred in 1821, 1849, 1877, and will occur in 1917, 1945.

PRIMITIVE CALENDAR. Among Amerind tribes, inchoate writing in the form of a rude inscription, sometimes called 'winter count,' recording notable events in the life of an individual or the history of a tribe. The woodland tribes made the inscriptions on trees or on birch bark; dressed skins were used by the tribes of the prairies; some of the tribes of the arid regions (e.g. the Prina) incised rude mnemonic symbols on canes or wands; while in Mexico and Yucatan calendric inscriptions of related character, although recorded in more or less arbitrary glyphs, rather than rude ideographs or ikonographs, were preserved in scrolls or books of magney paper. See *ARCHÆOLOGY, AMERICAN*; and *MAN, SCIENCE OF*.

CALENDAR. In general, an orderly list of things, especially with reference to dates, or of events. Specifically:

CALENDAR OF COURT, the official list of causes pending in the court for trial or argument. It generally contains the names of the parties and of their attorneys, as well as the date and nature of the issue, i.e. whether of fact or of law. Ordinarily, the causes are entered in the order of their date of issue (q.v.), the first one being that in which issue has been joined the longest; but the statutes and court rules give precedence to some cases over others. Certain actions brought by the United States or by a State may be advanced and tried out of their chronological order. Criminal cases are entitled to a preference over civil suits, and among criminal cases those for capital offenses have precedence over others.

CALENDAR OF PRISONERS. In England, a sheriff's certified list of all prisoners in his custody awaiting trial for felony, prepared for a court sitting under a commission of jail delivery (q.v.). In the United States similar lists are often required, either of the sheriff or of the keeper of a prison.

CALENDERING (Fr. *calandre*, roller, from Lat. *cylindrus*, Gk. *κύλινδρος*, *kylindros*, cylinder, roller). The term applied to the finishing process by which a glazed or polished surface is given to paper and various textile fabrics, such as linen and cotton. It is usually done by passing the fabric between cylinders or rolls under pressure, hence the origin of the term which is a corruption of cylindering. The familiar domestic process of starching and ironing illustrates in a simple form the object and result of calendering, and the common domestic mangle is a near approach in a simple form of the large calendering machines used in paper and textile manufacture. These machines consist of a series of from three to twelve rolls or 'bowls' set one above the other in a strong iron frame and so arranged that heavy pressures can be brought to bear on the rolls, and, therefore, on the fabric which is passed between them. The rolls were formerly made of wood, but this material proved

unsatisfactory because it warped. At present, when metal rolls are not used, the rolls are made of paper or cotton rendered solid by hydraulic pressure. Metal rolls are made of steel, chilled cast iron, or brass, and are often made hollow to allow them to be heated internally where hot calendering is required. The process of calendering consists in passing the fabric between the rolls a number of times, depending upon the material and the finish required. Often cloths are starched before being calendered. To impart a glaze or polish one of the pair of rolls is made to revolve faster than the other, which causes it to slide on the fabric, with exactly the same effect as results from the sliding back and forth of the flatiron in 'ironing' or polishing the domestic linen. Sometimes the surfaces of the rolls have slightly raised patterns which produce the effect known as watering. In making the rolls for calendering the utmost accuracy of workmanship is exercised to secure a truly cylindrical surface; metal rolls are turned on a lathe, then ground and finally polished. Great care has also to be taken in setting the rolls in the frame and in adjusting them to each other. The method of applying the pressure is by using weights or by hydraulic presses, or by means of screws, the former being preferable where heavy pressures are required. See *BEE TLING*.

CALENDERS, THE THREE. Three one-eyed dervishes in *The Arabian Nights*. They are disguised as beggars, but turn out to be princes.

CALENDIS. See *KALENDS*.

CALENTURA, *kā'len-tōō'rā* (Sp., from Lat. *calere*, to glow, to be hot). A medical term formerly applied to a tropical fever with acute delirium, never fully described, but supposed to attack sailors in hot climates. The word was revived during the Spanish-American War, as applied to a prevalent fever in Cuba and the Philippine Islands; also called Cuban fever. It is said to begin without prodromal symptoms, a chill and a temperature of 103° F. ushering in the disease. The temperature is likely to rise higher; muscular pains supervene, with headache, loss of appetite, nausea, and marked weakness. Many cases recover spontaneously in a week. Calomel, followed by a saline cathartic, is given with success. Quinine is said to possess no efficacy.

CALEPINE, *kāl'e-pēn*, SIR. A knight in Spenser's *Faerie Queene*. The most notable of his feats is the slaying of a bear with his hands alone.

CALEPINO, *kā'la-pē'nō*, AMBROGIO (1435-1511). An Italian lexicographer. He was an Augustine monk, and devoted his entire life to the making of a polyglot dictionary. The first edition appeared in 1502; the Aldi published eighteen editions of it in a half-century (1542-92). That of 1590 comprises eleven languages, some of them added by Passerat and others. The word *Calepinus* came to mean 'a dictionary.'

CALGARY. A city in the Province of Alberta, Canada, and the centre of a large stock-raising region, on the Canadian Pacific Railroad, 2264 miles west of Montreal, and 838 miles west of Winnipeg (Map: Northwest Territory, G 4). It was incorporated in 1885, having been a Hudson Bay post prior to the construction of the railroad. It lies on a beautiful plateau nearly

urrounded by Bow and Elbow rivers, and backed on three sides by lofty hills above which are seen the Rocky Mountains. It is an important distributing point for freight and the chief supply station for the mountain mining districts. It ships large quantities of cattle, sheep, and horses, and has a large trade in furs and hides. Its industries include the railway works of the Canadian Pacific Railroad, leather-making, soap-works, and brewing. The town is largely built of a light-gray stone. It contains churches, banks, good hotels, and schools, some costly public and private buildings, water-works, electric lights, and a good sewer system. It is one of the chief stations of the Northwest Mounted Police. The large Sarcee Indian Reserve lies to the southwest of the town. Population, in 1891, 1876; in 1901, 4866. Consult *Calgary Alberta* (Calgary, 1900).

CALHOUN, käl-hōon', JOHN CALDWELL (1782-1850). An American statesman, of Scotch-Irish descent, and Vice-President of the United States. He was the third son of Patrick and Martha (Caldwell) Calhoun, and was born in the Abbeville District (now county), South Carolina, March 18, 1782. Though early of a meditative disposition, he had, owing to the moderate circumstances of his family, little regular schooling, and he was 18 before he began the systematic study under his brother-in-law which fitted him in 1802 to enter the junior class at Yale. He graduated in 1804 with high honors, and then having studied law, partly in Charleston, he began to practice in Abbeville in 1807. He was soon sent to the State Legislature, and in 1811 was elected to Congress—the same year marrying a second cousin, Floride Calhoun, who had a moderate fortune. He sided with Clay and the war party in Congress, and on account of his strong personality came quickly to the front. He was distinctly nationalistic in his politics at this time, saying himself open to a charge of inconsistency when he later became a leader of the strict constructionists. In 1816 he was in favor of a national bank, advocated a strengthening of the navy for defense, and favored, as a means of binding together the widely spread Republic, not only internal improvements in the shape of permanent roads, but also a protective tariff. Calhoun became Secretary of War in Monroe's Cabinet in March, 1817, showing marked ability in the administration of a department then in the utmost disorder. He prepared, at the request of the House, a noteworthy report on roads and canals, and drew up one on Indian affairs which has received great praise. The army was reduced, and Calhoun's reorganization of it proved so satisfactory that his system was adhered to by his successors. In 1820 he favored the Missouri Compromise. He was now mentioned as a candidate for the Presidency, but General Jackson proved more popular, and Calhoun was elected Vice-President in 1824, with the support of the two principal parties. Turning to Jackson's side, in opposition to Adams, he was again elected in 1828. The passing of the 'Tariff of Abominations' of 1828, the protective features of which bore hard on the agricultural State of South Carolina, was the occasion of Calhoun's preparing a paper setting forth the claims of State sovereignty. This document was issued by the Legislature of his State, and is known as the "South Carolina Exposition." A definite break

with Jackson followed the President's discovery that Calhoun had sought to call him to account for his course in the Seminole War. Then, when Jackson tried, with the aid of Martin Van Buren, to reinstate in Washington society the notorious Mrs. Eaton, Calhoun refused to co-operate with him, thus widening the breach. Jackson's hold on the people was so great that he could dictate his successor, and Calhoun's chances of becoming President were now gone. When Calhoun became convinced that the repeal of the protective tariff could not be secured through Jackson, he published, July 26, 1831, a manifesto, carrying on the argument of the "Exposition," repeating his arguments for free trade, and asserting the right of the States to nullify such Federal laws as they considered unconstitutional. South Carolina regarded the tariff modifications of 1830 as being a compromise in fact, but a reassertion of the principle of protection. On August 28, 1832, Calhoun wrote to Governor Hamilton, of South Carolina, giving the final statement of his doctrine, asserting that "there is no direct and immediate connection between the individual citizens of a State and the general Government," and that "the great conservative principle" of union is nullification. When the South Carolina convention, on November 24, 1832, passed an ordinance nullifying the tariff, Calhoun immediately resigned the Vice-Presidency and entered the Senate. By a compromise, engineered by Clay, a conflict was avoided; South Carolina won the particular point as to the tariff, but failed to secure the establishment of nullification as a principle. Acting with the Whigs, but still independent, Calhoun now became a scathing critic of Jackson's administration, though never allowing personal animus to appear; he condemned severely Jackson's removal of the public Government deposits from the United States National Bank, and his development of the spoils system. Foreseeing more clearly than any one else the conflict between the North and the South on the slavery question, he sought to avert it by checking all discussion of the issue. When, after the financial crisis of 1837, Van Buren proposed the "sub-treasury scheme," by which the United States avoids all connection with banks and controls its own deposits, Calhoun supported the President, much to the chagrin of the Whigs, with whom he had been acting. He was in favor of Van Buren's reelection, and secured for him the vote of South Carolina. When Tyler, who became President on the death of Harrison, vetoed the bill for rechartering the United States Bank, Calhoun defended him; he denounced the tariff of 1842 and supported the Webster-Ashburton treaty. After having declined reelection to the Senate in 1843, he was, in March of the next year, through a clever move on the part of Henry A. Wise, appointed Secretary of State by Tyler, and was chiefly instrumental in bringing about the annexation of Texas, in order to extend slave territory, thus practically necessitating a war, which he strove later to avert. In 1845 he was again in the Senate. In order to check the anti-slavery movement at the North, he proposed in 1847 a convention of Southern States, to prevent Northern commerce from entering their ports. Slavery he had come to advocate as a positive good. In 1849 he proposed a Southern convention, to set forth the grievances

of the slavery side, looking toward "dissolving the partnership," if the only course left open seemed submission. His famous last speech in connection with the Compromise of 1850 was read, on account of his weakness, by another Senator. In this he asserted that an amendment to the Constitution would be necessary to restore equilibrium. He died March 31, 1850, having spent his last few months in writing his "Disquisition on Government," and his "Discourse on the Constitution and Government of the United States," probably the most remarkable discussions of the rights of minorities ever written.

Calhoun's personality was attractive and his morals were irreproachable. His power of logical analysis, though perverted, seems to entitle him to rank as our most original political theorist; he was probably too much of a doctrinaire to be held a statesman of the first order. It must be conceded, however, that throughout his long political career he impressed both friends and foes as only a man of extraordinary powers can do, and it is quite clear that he really believed that the only way to preserve the Union, which he dearly loved, was to reduce its strength almost to the vanishing point. Consult: *Life*, by Jenkins (1851), and by Von Holst (1882); Benton, *Thirty Years' View* (1854); *Calhoun's Collected Works* (6 vols., 1853-54); and his correspondence, edited by J. F. Jameson (1900).

CALHOUN, kál-hōon', SIMON HOWARD (1804-76). An American missionary. He was born in Boston; graduated from Williams College in 1829, and went as missionary to the Levant and later to Syria, where he labored with great success till his return in 1874. He was an authority on the Arabic and Turkish languages, and assisted in making the first translation of the Bible into Turkish.

CALÍ, ká-lé'. A city of Colombia, in the Department of Cauca (Map: Colombia, B 3). It is situated on the Calf, near its junction with the Rio Cauca, 3100 feet above sea-level, and contains the fine Ionic Church of San Francisco and a college. A noteworthy bridge crosses the Rio Calf at this point. The city is of considerable commercial and industrial importance, and is well equipped with business facilities: bank, telegraph, Government post-office, etc. Calf was founded in 1556. Population, about 12,000.

CALIBAN. (1) A deformed monster in Shakespeare's *Tempest*. He is the son of the witch Sycorax and a devil, and originally laid claim to the sovereignty of the enchanted isle. Prospero soon obtained complete mastery over his small mind, however, and has made a servant of him at the beginning of the play.

(2) A cynical philosophic drama by Ernest Renan (q.v.), published in 1878. It professes to take up the story of Caliban from where he is left in Shakespeare's *Tempest*.

(3) The *nom de plume* of Emile Bergerat.

CALIBAN UPON SETEBOS, or NATURAL THEOLOGY ON THE ISLAND. A characteristic psychological poem by Robert Browning. In it Shakespeare's amorphous creature, Caliban, discourses 'touching that other, whom his dam called God.' The text, "Thou thoughtest that I was altogether such a one as thyself," is a subtly ironical comment on the savage's words.

CALIBO, ká-lé'bó. A town of Panay, Philippines, in the Province of Capiz, situated on the

northern coast of the island, 40 miles west of Capiz. Population, in 1898, 10,815.

CALIBRE (Fr., perhaps from Lat. abl. sing. *qua libra*, of what weight, measure). The calibre of a smooth-bore gun is the diameter of the bore. The calibre of a modern rifle of ordinary type is the diameter of a cylinder which will just touch the highest points of all the *lands* (the part of the surface of the bore between the grooves). In the case of rib-rifled guns, which have relatively very narrow lands, the calibre is the diameter of a cylinder which would just touch the bottom of all the grooves. The old smooth-bore cannon were designated by the weight of the shot they threw, as 24-pounder, 68-pounder, etc.; modern rifled cannon are described by the calibre, such as 10-inch, etc. The length of a piece is now designated by the number of calibres; for example, a 12-inch gun 40 calibres long is 40 feet in length, etc. See **ARTILLERY**; **GUNS, NAVAL**; **ORDNANCE**; **PROJECTILES**; and **SMALL ARMS**.

CALIBURN. Another name of King Arthur's sword Excalibur.

CALICOBACK, or **CALICO-BIRD**. See **TURNSTONE**.

CALICO BASS (possibly so called because of its variegated color). A sunfish-like, mottled-olive bass (*Pomoxys sparoides*) of the whole Mississippi Valley and Great Lakes, highly prized as a food-fish and as game for youthful anglers. It reaches a length of 12 inches, weighing 2 pounds, haunts grassy streams and ponds, and bears transplanting well. It is a near relative of the crappie (q.v.), and is also known as grass-bass, strawberry-bass, and bar-fish. For illustration, see Plate of **FRESH-WATER BASS**.

CALICO-BUSH. See **KALMIA**.

CALICO-PRINTING. See **TEXTILE PRINTING**.

CALICUT (Hind. *kolikodu*, *kolikotta*). A seaport of the Malabar District, British India, in latitude 11° 15' N., and longitude 75° 50' E., 566 miles south-southeast of Bombay, on the Indian Ocean and at the terminus of the southwest branch of the Madras Railway (Map: India, C 6). It was the first spot in India visited by Covilham (1486), and it was here that Vasco de Gama reached the shores of India in 1498, having come by the way of the Cape of Good Hope. Calicut was at that time prosperous and powerful. It twice repulsed the Portuguese, slaying their commander in 1509. It stands near the mouth of a small river of the same name, and possessed at one time a good haven. Now its anchorage is merely an open roadstead. Aside from this physical disadvantage, the ravages of war and the competition of superior localities contributed to the decay of Calicut. In 1792, when it fell into the hands of the English, the city was little better than a ruin, Hyder Ali, in 1765, having laid it waste to chastise European cupidity. Since then it has made considerable progress, and in 1891 had 66,100 inhabitants, which increased to 75,500 in 1901. From Calicut, *calico* derived its name, although the manufacture of that article has now declined. It has an important export trade in timber and spices.

CALIDARIUM (Lat., hot bath). See **BATH**.

CALIDIUS, MARCUS (? B.C.47). A Roman orator and a contemporary of Cicero, whose recall from exile he advocated. He was prætor in B.C. 57 and after B.C. 49 was made Governor of Cisalpine Gaul, where he died. His oratory is praised by Cicero (*Brutus*, 75-80). For the fragments of his orations, consult Meyer, *Fragmenta Oratorum Romanorum*, 2d ed. (Zurich, 1842); also Quintilian (X. 1 and XII. 10).

CALIDORE. A knight representing courtesy in Spenser's *Faerie Queene*. He stands in the allegory for Sir Philip Sidney.

CALIF DE BAGDAD, ka'lêf' de bag'dád', L.E. See BOELDIEU, A. F.

CALIFORNIA (a name applied in Spanish romance as early as 1520 to a fabulous island near the Indies, and "very near the Terrestrial Paradise"). A State on the Pacific Coast of the United States of America, ranking second in area (not reckoning the Territory of Alaska), twenty-first in population, and eighteenth in order of admission, and popularly known as the "Golden State," or in the West simply as the Coast (Map: United States, Western Part, B 3). The State is bounded on the north by Oregon, on the east by Nevada and a small portion of Arizona, on the south by Lower California (Mexico), and on the west by the Pacific Ocean. It stretches along the coast from latitude 32° 40' N. to latitude 42°, a distance, measured along the centre of the State, of 750 miles, and its eastern boundary conforms to the curve of the seacoast, so that its breadth is approximately the same throughout, averaging about 200 miles. The meridian of 120° W. longitude marks the eastern boundary of the northern third of the State, and bisects the eastward-trending southern part, dividing the whole into two nearly equal parts. The total land area is 155,980 square miles.

TOPOGRAPHY. The physiography of this immense State is strikingly varied, but, broadly stated, consists of two parallel mountain systems, extending northwest and southeast, inclosing between them a very extensive valley, in addition to which is included in the northeast a part of the Great Basin, and in the southeast a part of the Colorado Plateau. Of the two mountain systems, the longer is that known collectively as the Coast Range, being a part of the uplift which defines the continental west coast from the extremity of Lower California to the edge of Oregon, and which reappears in the Olympic range of Washington and the islands of British Columbia, and southern Alaska. Within the limits of California, beginning at the south, it is made up of the San Jacinto, Santa Ana, San Bernardino, and San Gabriel ranges, then of the San Rafael and Santa Lucia mountains along the lofty coast between Los Angeles and Santa Cruz. Interior to these is a second lesser range, called by the Mexican settlers Sierra Madre, which becomes more prominent northward, is broken by the Bay of San Francisco and outlet-valley of the Sacramento River, and extends thence to the border of Oregon, where the watershed bends eastward and forms the very lofty Shasta and Salmon River ranges; but Shasta belongs orographically to the Cascade system of Oregon. Notable altitudes in this system are as follows: San Bernardino Mountain, 11,600 feet; San Jacinto Mountain, 10,987 feet; San Gabriel Peak, 6152 feet; Te-

bachapi Peak, 9214 feet; Mount Pinos, 9214 feet; Mount Diablo, 2849 feet; Thunder Mountain, 9125 feet; Eddy Mountain, 9161 feet; Scott Mountain, 7850 feet; China Mountain, 8000 feet; Siskiyou Peak, 7662 feet. The altitude of Mount Shasta, a volcanic mass, is 14,380 feet, and its group contains several other peaks approaching 10,000 feet in height.

East of the Coast Ranges, and parallel with them, lies the Sierra Nevada ('Snowy Range'), at a distance of 100 to 140 miles, stretching from the 36th parallel northwestward nearly to the 41st, where it ends at the valley of Pitt River, which separates it from the Shasta Range. This system, one of the grandest on the continent, consists of a massive uplift of ancient stratified rocks, which have been worn into an area of clustered peaks, averaging 50 miles wide and over 400 miles long. The eastern side is abrupt and rises from the plateau of Nevada, but the western slope, receiving nearly all the rainfall and delivering all the drainage, has been worn into a series of tremendous cañons, of which those of the Merced (Yosemite), Kings, Tuolumne, and American rivers are far-famed. The Sierra Nevada is characterized by its extreme ruggedness, the sharp, precipitous, deeply sculptured profile of its peaks and gorges, and by the great average altitude of its central mass, as well as by the prevalence of many peaks, which not only reach into the zone of perpetual snow, but bear remnants of the vast glaciers which, until comparatively recent times, covered the crests of the whole range and took so large a part in its erosion. The principal peaks and their measurements, from south to north, are as follows, beginning with the highest mountain in the United States proper: Mount Whitney, 14,998 feet; Kaweah Peak, 14,000 feet; Mount Brewer, 13,886 feet; Mount Lyell, 13,042 feet; Merced Peak, 11,413 feet; Gray Peak, 11,174 feet; Dunderberg, 13,320 feet; Twin Peak, 8924 feet; Matterhorn, 12,175 feet; Tower Peak, 11,704 feet; Leavitt's Peak, 11,553 feet; Sonora Mountain, 11,478 feet; Stanislaus Peak, 11,209 feet; Pyramid Peak, 10,052 feet. The fact that the southern end of the range is loftier than the northern may indicate the greater work of erosion at the north, due to the greater rainfall there. From Sierra County there runs straight northward along the Nevada boundary a line of elevations of igneous origin, called the Warner Range, containing many high peaks. West of this line of peaks a plateau formed by a lava overflow and averaging 5000 feet above the sea, stretches to the Shasta and Siskiyou mountains and northward into the Klamath region of Oregon.

Between these two mountain systems, the Coast ranges and the Sierra Nevada, lies the great valley of California, broadly open for some 400 miles from where the Kern River Mountains connect the Sierra Nevada with the Coast Range at Tehachapi, to where Shasta closes it in the far north. This valley is divisible into three parts. The first is the basin of the Sacramento River, north of San Francisco Bay, into which the river empties. This stream begins as the Pitt River, which flows out of Goose Lake, in the northern part of the State, forces its way through the gorges that separate the Sierra Nevada from the Shasta Range, and after receiving the McCloud from Mount Shasta, turns southward as the Sacramento River. It is fed by many streams

from the mountains on each side, of which the Indian, Feather, and American are largest, and in its lower course traverses a marshy flood-plain, annually overflowed. South of where the river turns into the sea and expands into Suisun and San Pablo bays, the valley is occupied by another large river, the San Joaquin, which gathers the waters from all the southern mountains, through its own sources in the heights of Fresno County, and by means of the Merced, the La Grange, Stanislaus, Calaveras, Consumnes and many lesser streams, which periodically pour floods down the valley to flood many square miles of reedy marshes, among which the San Joaquin joins the Sacramento. South of the head of the San Joaquin Valley, and separated from it at Fresno by a low divide, begins a somewhat circular, dry, and fairly level plain, about 100 miles long by 80 broad, the western part of which is a low, alkaline desert, surrounding Tulare Lake—an expanse of marsh-girt waters, 25 miles broad. Into this basin pours Kings River, and toward it flow many other mountain streams, which mostly disappear in the sand. In the southern part of this valley-plain the Kern River flows southwestward through a region some 500 feet above sea-level, and empties into Buena Vista Lake. South and east of the mountains the country becomes a hot and waterless waste, named Mohave and Colorado deserts, sloping gradually to the Rio Colorado and the Gulf of California. In the northern half this waste is broken by ranges and groups of arid, volcanic hills, among which lie deep salt-covered valleys, the most forbidding of which is Death Valley (q.v.), an alkaline, lava-strewn depression near the Nevada boundary and just north of the 36th parallel. The valley is from 200 to 350 feet below sea-level. On the seaward side of the Sierra Madre, however, is an extensive region, narrowing northward to Santa Barbara, comprising the most populous and useful part of Southern California—the districts about San Diego, Los Angeles, Riverside, Ventura, and Santa Barbara. Similar coast districts are repeated northward in Monterey and Santa Clara counties, and north of San Francisco Bay, in Sonoma and Mendocino counties, west of the Coast Range. Some important rivers descend to the sea in these coastal spaces, such as Russian River, in Sonoma County; Eel River, in Mendocino and Humboldt counties; and Trinity River, in Trinity County, all of which have a northwest course. Flowing irregularly southwest across the northwest corner of the State, is the Klamath River, which drains the Siskiyou, Salmon, and other coast ranges of that region.

The coast south of Santa Barbara is low and sandy, with several large islands in the offing. But north of Santa Barbara it is high and rocky, bold cliffs facing the sea, almost unbroken by harbors, other than that of the Bay of San Francisco, entered through the rift in the coast, cut by the joint outflowing of the Sacramento and San Joaquin rivers, and called the Golden Gate.

CLIMATE. No State of the United States, indeed, few of the most favored countries of the world, can boast of so delightful a climate as that of the valley lands of California. Two seasons, the wet and the dry, divide the year; the first so called because it is the only period during which it rains, though rains are not continuous, and the average fall for the State, twenty-three inches, is less than at Chicago or

Saint Louis. This season lasts from about the middle of November till April or May.

At San Francisco snow is almost unknown, the mercury never remains below the freezing point for twenty-four hours, and flowers bloom in the gardens at Christmas time. The average mean temperature at San Francisco is 51°—summer, 60°; winter, 49°. Trade winds from the southwest prevail along the coast and give the valleys opening toward San Francisco Bay a climate peculiarly their own. Owing to the cool summer climate of the coast between parallels 35 and 40, San Francisco in July is cooler than San Diego by 7°, and than New York by 17°, and does not attain its highest temperature until the trade winds cease in September.

In the central valleys greater extremes of temperature are experienced than along the coast. The mean temperature for this belt is 64°, and is remarkably uniform. In the north the summer is warmer and the winter cooler than in the south. The rainfall decreases gradually from north to south, being 51 inches at Cape Mendocino and 46.6 inches at Redding, in the interior. On the same parallel as Cape Mendocino, 23 inches at San Francisco and 4 inches at Bakersfield. In southern California, the climate may be said to reach perfection. At San Diego, the mean winter temperature is 54°, summer, 68°, and at Santa Barbara, 53° and 68° respectively. At Monterey, the difference between the average temperature of January and July, is 6°; at Los Angeles, 12°. San Diego is 6° or 7° cooler than Charleston or Vicksburg, which are nearly in the same latitude. The great heat of the interior and of the southwest, where, as at Fort Yuma, the average summer temperature is 92°, is due to the dryness, which is easily borne, and sunstrokes never occur. Thunderstorms are common in California. Everywhere the nights are cool, or at least endurable; the clearness of the atmosphere causing rapid radiation. Early spring, comprising the latter part of February and the month of March, is the most delightful part of the year. The air is mild, the sky clear, and the landscape gay with flowers. Summers are dry except along the coast from six to ten miles inland, where fogs are likely to occur. During the summer the earth becomes dried to a depth of several inches; the air is filled with dust, the vegetation is burned brown, and the smaller streams disappear, a state of things that lasts until the autumn rains begin. Among prominent winter resorts are San Diego, noted for its fine harbor, on one side of which is the famous Coronado Beach; Santa Barbara, overlooking the Pacific, a favorite watering-place; Santa Monica, noted for surf-bathing throughout the year; Santa Cruz, with a fine beach and background of mountains; Monterey, on beautiful Monterey Bay, associated with the earlier history of the province under Spanish rule; Indio, over 100 feet below sea-level, is remarkable for cures effected by its air in pulmonary diseases; Los Angeles and adjoining places, including Pasadena, in a section that has been termed 'the Italy' of the United States—a paradise of rose-gardens, vineyards, and lemon and orange groves. Other resorts are the Arrowhead Hot Springs, El Paso de Roble, and Napa Soda Springs.

FLORA. As California presents almost every variation of climate known on earth, ranging from that of the tropics to that of the Arctic

regions on its high mountains, and from a copious rainfall to the aridity of the desert, it naturally presents a very wide variation in its flora. The influence of climate upon flora is nowhere more strongly marked than in this State. The tree flora of California, as of the entire western part of the country, is characterized by consisting almost entirely of coniferae, while broad-leaved trees are very few in number, consisting of oaks, madroña, and a few other species very limited in number and distribution. The trees of all species are of great size. For illustration, see SEQUOIA.

Stretching along the Coast ranges from the Oregon line southward nearly to the Bay of San Francisco, and in scattered groves even as far as Santa Cruz, is found the redwood, whose enormous trees form an extremely dense forest, extending to the lower part of Mendocino County. This forest occupies the foggy, wet stretch of land closely bordering the coast. East of this, in the northern Coast ranges, is a mixed forest consisting of red fir and yellow and sugar pines. The coast ranges south of these forests are almost treeless, but are covered with grasses, and often with a variety of thorny bushes, catsclaw, manzanita, scrub oak, etc., which collectively are known as chaparral. Here and there among them are scattered oaks and digger pines. The ranges of southern California, which rise to greater altitudes, are, on their lower slopes, covered with chaparral, while above 5000 feet are open forests of yellow pine, with scattered specimens of sugar and Coulter pine among them. The valleys of southern California contain some chaparral, with a little grass and many cacti and Spanish bayonet, being the vegetation which is peculiar to an arid region.

The great valley of California is, in its northern part, covered with a scattering growth of oaks, while the southern part is devoid of timber of any sort, and is more or less under cultivation. The marshes on the lower courses of the Sacramento are covered with tule reeds. The Sierra Nevada is, on its lower slopes, covered with a thick growth of chaparral, with a few oaks and digger pines, while above an altitude ranging from 3000 feet in the southern part to 1500 feet in the north begins the yellow-pine belt, which is composed mainly of trees of that species, with sugar-pine, incense-cedar, and red fir intermingled. This occupies a strip on the west slope of the range, extending up to an altitude of 8000 or 9000 feet, above which it is succeeded to the timber-line, which ranges from 9000 to 10,000 feet, by trees of more Arctic character—firs, hemlock, and, finally, at the timber-line, by white-barked pine. On the east side of the range the succession is somewhat similar, but the belts are much narrower, owing to the abruptness of the range on this side. The plateau east of the range is a desert, with very little vegetation, and that of low shrubby growth. In the yellow-pine belt, upon the west slope of the Sierra, there occur ten groves of Sequoia Gigantea, the largest and oldest tree on earth, ranging in size up to 33 or 34 feet in diameter, with heights of from 300 to 350 feet. These do not occur in pure growth, but scattered among the yellow pines. Most of the groves are within national forest reserves or national parks, but much of the land, unfortunately, is held in private hands, and the trees are being cut for lumber.

FAUNA. As California extends north and south through nine degrees of latitude, and ranges from arid deserts in the south to humid and forested mountains in the north, and from the lofty Sierras on the east to the sea, it must not only embrace a large variety of animal life, but include several distinct faunas adapted to its varied climates and terrenes, such as those of the coastal valleys and plains; of successive zones of altitude in the mountains; of the sandy southern semi-tropical deserts, etc. Few of its animals are of the same species as those found in the eastern half of the United States. The representatives are all of distinct surface races; but California is closely allied, zoologically, to the interior basin and Rocky Mountain region. Among the characteristic mammals of the State are the grizzly and black bears; wolves, large and small, and several fur-bearers; puma and lynx; varieties of the white-tailed and black-tailed deer, and in the extreme north the Columbian blacktail. The bison never entered the State; the wapiti did so formerly, but is no longer to be found there. The bighorn wanders in the high Sierra, where also are found the peculiar little beaver-like sewellel, and various picas. Several rodents, such as the golden and Douglas squirrels, are peculiar to these parts of the mountains, while the plains abound in burrowing rodents, among which are large hares that have increased since civilization reduced their enemies, until in the central and southerly parts of the State they have become a decided pest. The coast fauna comprises several representatives of the seal family. The birds of California include many species not known elsewhere. A species of vulture, the California condor, was the most remarkable, but is now extinct in Lower California. The two-crested quails of the State are familiar to sportsmen, as also is the large local ground-cuckoo, called road-runner. Another remarkable local bird is the California woodpecker, peculiar in storing great quantities of acorns in holes in the bark of trees for winter consumption. The islands off the coast, especially the Farallones, are well supplied with sea-birds. Among reptiles, two or three species of rattlesnakes are exceedingly numerous in the lower parts of the mountains, and all over the southern region, where also a great variety of lizards exists. The fishes of both the sea and fresh waters are numerous and valuable. Peculiar classes of sea-fish are the rose-fish, smelts, surf-fish, herrings, rock-trout, and various important food-fishes of the cod family. The rivers of the north receive annually vast 'runs' of salmon, which are different from the Eastern salmon (see SALMON). Few of these fishes are the same as Atlantic species, but many belong to groups well represented elsewhere. The care and protection of game animals and fish-culture have received much attention.

GEOLOGY. A large part of the area is underlain by sedimentary strata of a comparatively recent geological age. Triassic and Jurassic beds predominate in the northern and west-central parts, and Cretaceous and Tertiary beds in the coastal region. Along the Sierra Nevada and Coast ranges volcanic rocks are strongly developed and cover wide areas. The central axes of these two great ranges are formed, however, by ancient igneous and metamorphic rocks which may belong to the Archæan formation. Granite is especially

prominent in these localities and constitutes some of the highest peaks. The elevation of the Coast Range took place at the close of the Miocene period, while the Sierras were formed largely by an uplift that occurred near the end of the Jurassic period. Carboniferous strata occupy a large area in the central part of the State, but they inclose no coal-seams of economic importance.

MINING. California is rich in mineral deposits, particularly gold, which is found in over thirty counties, and the rapid settlement and development of the State were due to this fact. Gold was obtained by washing as early as 1841, near San Fernando mission; but it was the discovery at Sutter's Mill, near Coloma, in 1848, that made evident the abundance of the metal and attracted the excited throngs of adventurers. Many of these engaged in river mining—i.e. washing in sheet-iron pans or wooden 'rockers' the gold from the sands or gravels from or near river channels; others dug the gold 'dry' from veins in the rocks. About 1851 sluices were introduced, by means of which the gravels or sands were run over the bottom of a wooden box provided with blocks of wood or round stones to catch the gold as it sank. Digging soon extended from the rivers and the gulches to the higher ground, where the difficulty of washing was increased; but in 1852 the hydraulic system was brought in. In this, continuous powerful streams of water are directed through nozzles upon a gold-bearing bank or deposit. This was so successful that whole hills were reduced and swept away, but this practice was soon forbidden by law, as the detritus threatened to choke the rivers and seriously damage the agricultural interests in the valleys below. Nearly all the mines are on the western slope and in the foothills of the Sierra Nevada in a belt of country about 220 miles long by 40 wide, extending into Oregon. The gold is found in a metallic condition, but is usually mixed with silver or other metals. In stream or alluvial deposits ('placers') it occurs as fine scales or coarse grains. In rocks, it is found in quartz veins, and costly machinery must be used to crush the ore, from which the gold is extracted by amalgamation with quicksilver. Where, as often is the case, the gold-bearing gravels underlie volcanic rock several hundred feet thick, drift or tunnel mining combined with sluicing is necessary. The chief gravel-mining region extends from Mariposa County into Plumas County, or between parallels 37° and 41°, and includes some quartz veins. Most of the gold is now obtained from the quartz mines, especially in Calaveras, Kern, Trinity, El Dorado, Nevada, and Sierra counties. Gold-mining is to-day greatly facilitated by the application of electrical power, which the mountain streams are made to generate. The great prominence and significance of gold in the early years of the State are evident from the great size of the output, the annual average for the decade between 1850 and 1859 inclusive being estimated at over \$55,000,000, and constituting nearly the entire product of the United States. Following this period there was a constant decline in the output, which reached the minimum (\$12,000,000) in 1892; it then revived, and for the last half-decade of the century averaged over \$15,000,000 annually. The State continued to hold first place until 1897, when it was surpassed by Colorado. The total output of the State to the

end of 1900 was about \$1,350,000,000. While rich silver ores are found, there are no mines which produce silver exclusively. The \$700,000 of silver mined in 1900, an increase over former years, was a by-product from gold, lead, or copper mining. Copper-mining has recently made rapid progress, and the State ranks fourth in the production of copper ore, the product having increased from 6300 tons in 1897 to 13,200 tons in 1900.

This ore, which is found principally in Shasta County, is partly shipped out of the State for smelting. The State produces almost the whole of the quicksilver output of the United States, its mines rivaling those of Spain in productivity. From 1875 to 1882 the output averaged 64,000 flasks annually, but since that period the annual average has been only 30,000 flasks; the value of the product ranged from \$1,000,000 to \$1,500,000. Fifty per cent. of the product is secured from Santa Clara County. The fuel products of the State include petroleum, bituminous coal, and natural gas, of which the first is the most important. The oil is found in the southern coast region, particularly Los Angeles, Kern, Santa Barbara, and Ventura counties. It is refined to some extent, but its most important use is as a fuel. Its production is steadily increasing, the output having grown from 300,000 barrels in 1890 to 4,250,000 barrels in 1900. Bituminous coal is mined in Monte Diablo and the neighboring hills. For several years the output fluctuated around \$200,000 in value, but for a few years now the annual output has doubled that amount. Natural gas is found in the Sacramento and San Joaquin valleys. The State ranks second in the production of mineral water, the product for 1899 having been estimated at \$698,000. Salt is obtained by the evaporation of seawater. Building-stone is abundant, and includes hydraulic limestone, rhyolite, bluish and light-brown sandstones from San Francisco Bay, and from San José a light-brown variety, which is almost pure silica, cuts easily, and stands fire well. San Bernardino County yields marbles of many shades; El Dorado County, fine white marble, streaked with blue; and in Inyo County some of the foothills are composed of white marble equal to Italian. Freestone, buhrstone, granite, and basalt suitable for pavements and buildings are also found in abundance, while the granite output averaged in value about \$1,000,000 annually during the last decade of the century. Brick clays occur in some localities. Asphalt is obtained in varying quantities and constitutes the greater part of the output of the United States, the largest annual product, that for 1898, exceeding \$600,000 in value.

FISHERIES. California rivals Oregon in the extent of her salmon fisheries, the annual exports of salmon alone exceeding \$2,000,000 in value. The supply of this and other varieties of fish has been increased through the activity of the State Government in enforcing protective laws and establishing hatcheries. The annual exports of shell-fish fall a little under \$200,000 in value. The total value of the exports of fish from San Francisco during 1895-97 exceeded \$2,500,000. There is a large local consumption of salt fish—flounder, sole, and tomcod—the supply of which is secured by drag-net fishing along the mud-banks extending from Point Reyes south to Men-

terey. The State ranks next to Massachusetts in whale-fishing.

AGRICULTURE. California has no equal among the States, and, indeed, scarcely among the countries of the world, in natural agricultural possibilities. In no other part of the world is so great a variety of crops brought to so high a stage of development. Over the greater portion of the agricultural area the crops of both the temperate and the sub-tropical zones can be grown at will, with equal success. Since 1850 the agricultural section of the population has increased more rapidly than any other. During the decade 1890-1900, the number of owners and tenants increased much more rapidly than did the total rural population, being contrary to the tendency shown in the two decades preceding. This is indicative of the movement now in process by which the large estates under the influence of increased irrigation and intensive cultivation are passing into the hands of smaller landowners. These large estates were partly the result of easy acquisition of land and partly of confirmation by the United States Government of Mexican land grants to private individuals. The holders of these estates were at first opposed to subdividing them, and only recently have settlers been able to obtain desirable farms on them. Still the average size of the farms in 1900—397.4 acres—was quite large, and there were 4753 farms which contained 1000 acres and over, constituting 62.8 per cent. of the total farm acreage. The income per acre from the farms is in inverse ratio to their total area; the farms under three acres in size having an average income of \$253.89 per acre, while the farms of 1000 acres and over averaged but \$2.02 per acre. The smaller farms are devoted to city dairying, and to floriculture, and to the more valuable and intensively cultivated crops, while the larger are generally unirrigated stock or grain farms.

The earlier agricultural period was characterized by the great predominance of wheat-raising. Many of the large holdings were almost exclusively devoted to this industry, giving rise to the large ranch or bonanza farms of world-wide fame. Thus the production of wheat became enormous, at one time exceeding that of any other State. This was accomplished for the most part without irrigation. The Defiance and the White Australian varieties were grown for milling, and Sonora wheat for shipping, the dryness of the atmosphere resulting in a superior quality of grain which was in special demand in the London markets. The maximum acreage under wheat (2,875,000) was reached in 1893, since when the State has lost in relative importance as a wheat-producing State. The central valley is the great wheat district of the State. Owing to the level formation of the surface and the freedom from any kind of obstruction, the most expensive and complicated farm machinery invented is more extensively used here than anywhere else in the world. The same machine plows the ground, prepares the soil, and sows the seed, and probably two-thirds of the crop is gathered with a combined reaper and thresher. Steam power is largely used. Barley is the only other cereal which is extensively grown, and the only crop which has been rotated with wheat. The conditions are very favorable to its growth, and there is a tendency to substitute it for corn as a stock-food. About 1,000,-

000 acres are devoted to its cultivation—or nearly one-third of the total acreage under that crop in the United States. Both wheat and barley are extensively used for hay, being cut down while green. Corn matures later and requires irrigation, and inasmuch as the irrigated land is more profitable when devoted to the more valuable crops, and barley can be substituted for corn, but little of the latter is cultivated. Oats likewise is little grown except for use as hay. The total, in 1900, for all grains cut green for use as forage was 1,506,000 acres, or considerably more than twice the amount of all other hay and forage crops. The acreage for hay and forage crops was 56.4 greater in 1900 than in 1890. The abundance of alfalfa and other food-plants of the bee has encouraged the keeping of bees, and honey is a considerable product.

The native grasses, oats, and clover dry without cutting, but constant pasturage has almost exterminated them, and alfalfa in moist regions, and Texas mesquit grass on dry hills and plains, are taking their place. Alfalfa yields three to four crops a season. The cultivation of hops is rapidly becoming an important industry.

IRRIGATION. The aridity of the climate of California is not so extreme as is generally supposed, nor is it without its advantages. In most parts the rainfall of the spring months is sufficient for the development of the early-maturing crops, while the numerous mountain streams supply a source of irrigation for the production of the more valuable or the later-maturing crops. In nearly every county some farming is done without the aid of irrigation. The irrigated area, however, is being constantly and rapidly extended, and is exceeded only by that in Colorado, although the value per acre of the products of the irrigated land is much greater than that of Colorado or any other State. In 1900 the advantages of irrigation were afforded to 35.4 per cent. of the total number of farms and to 12.1 per cent. of the total improved acreage, or 1,446,000 acres of land. The irrigated farms averaged only 57 acres in area. The average cost, per acre irrigated, of the construction of works for irrigation was \$10.30 for the State, but in certain districts, and particularly in the southern counties, the cost is much higher, reaching \$42.57 in San Diego County. There are 152,500 acres irrigated from wells and tunnels, but the greater portion receives its supply from streams and other surface sources.

As a result of the growing irrigation facilities, the horticultural products are becoming especially prominent. Many varieties of horticultural plants, difficult or impossible to raise in other States, and for a supply of which the country was formerly dependent upon imports from abroad, are now produced with great success in California. This is especially true of the regions where the rainfall is lightest, and the necessity and consequent advantages of irrigation are greatest—i.e. on the southern Pacific coast and in the valley of the San Joaquin. But more recently the development of fruit-growing in the Sacramento Valley has made irrigation prominent in that region, the application of the system being greatly facilitated by the utilization of abandoned ditches, originally used as water-conduits in connection with hydraulic mining. In the central and northern coast regions the natural rainfall, unaided by irrigation,

is adequate even for fruit-culture. The cultivation of fruit and the preparation of it for the market now give employment to more people than any other industry. Of the great variety of horticultural plants grown in the State, the most notable are the vine, the citrus fruits, oranges and lemons, and the prune, the latter being more extensively cultivated than any other orchard fruit in the State.

Viticulture was early introduced by the Spaniards, but no specialty was made of it until 1857. At present it receives much attention in almost every agricultural section of the State. The choicest and hardiest European wine-grapes

passed, and they have come to occupy an accepted place among the staple products of the State. Almonds are grown principally in the central part of the State; olives and walnuts in the southern part; while figs and apricots have a more general distribution. A large number of other tropical or semi-tropical fruits and nuts are now being successfully introduced. Vegetables are raised in great abundance, being shipped abroad. The conditions are especially favorable for the sugar-beet, the State ranking with Michigan in the production of that plant. The following table shows the development of the fruit industry for the last decade:

GENERAL SUMMARY AND COMPARATIVE TABLE OF SHIPMENTS BY RAIL AND BY SEA, OF FRUITS, WINE, BRANDY, AND VEGETABLES. (TONS OF 2,000 POUNDS.)

KINDS	1890	1892	1894	1896	1898	1900

Not reported.

have been imported, and are rapidly replacing the less desirable varieties. The phylloxera has created great havoc, and the only way of overcoming it seems to be by grafting choice varieties of grapes on native wild vines known as *resistant* vines, which the phylloxera will not attack. The production of wine and raisins (see table below) has reached enormous proportions, and the State supplies the whole country with table-grapes of superior qualities. Fresno County is especially famous for its raisin crop.

Oranges were first planted in Los Angeles, and up to about 1872 the production was confined principally to that region. A large part of the long interior valley has since been found to be adapted to citrus-culture, and the citrus belt now extends along the foot-hills from Shasta to San Diego, a distance of over 700 miles. Owing to the dry warmth of the inner valleys and to the longer days in summer, the fruit ripens at Oroville, Newcastle, etc., six weeks earlier than at Riverside or Pasadena. In southern California oranges are gathered fresh from Christmas to July, and lemons and limes all the year. Nine or more varieties of oranges are grown, and from the sweet navel, or seedless orange, a non-alcoholic wine is made.

In the year 1899-1900 over 17,000 cars of citrus fruit were shipped from the State, the value of which exceeded \$8,000,000. The production of prunes is greatest in the Middle Coast counties. The State produces about half of the total crop of the United States, and has outstripped even France. The production of apples, peaches, pears, and cherries is also enormous, but the output for each of these is at least equalled by other States. Berries grow luxuriantly, and in the southern part of the State strawberries are gathered almost throughout the year. The success attending the production of apricots, almonds, olives, figs, and walnuts is of especial interest, inasmuch as the experimental stage has now been

Thus it will be seen that the horticultural development in California has been rapid and continuous. For certain products, however, further immediate extension seems improbable, as the supply now equals the demand. Such products as can find a foreign market may and do continue to develop.

STOCK-RAISING. The equable climate greatly favors stock-raising. By shifting the stock from the foothills in the summer to the valleys in the winter, pasturage is afforded for the greater part of the year. The increased production of alfalfa has greatly advanced stock-raising. The State was formerly one of the foremost sheep and wool producers, but for twenty-five years the number of sheep has constantly decreased, and at the close of the Nineteenth Century was less than one-half its former size, being about 2,000,000. Large numbers of cattle are shipped into the State from Arizona to be fattened for market. Dairying has but little developed. The general breed of horses is not of a high grade, but there are a number of large horse-raising farms which are noted for their superior breeds, and their trotters, especially, are in great demand in the eastern markets. Ostrich farming is limited to a few ranches.

MANUFACTURES. California has been subject to a variety of conditions, the effect of which has been to guarantee a steady development of the manufacturing industry, but within very definitely restricted limits. The State's comparative isolation and remoteness from other centres of population, and the heavy freight charges necessarily incurred in transportation to and from the State, have given a field free from competition. At the same time, these very conditions have denied entrance into the more extensive market of the world, except with those manufactures for the production of which the State's superior resources give a decided advantage. California is further held back by the high

price of labor, and the scarcity and consequently high price of fuel. Moreover, the superior advantages offered in mining and agriculture have tended to divert capital from manufacturing. Nevertheless, the value of manufactured products has reached a high figure, being exceeded in but few States. The exceptional resources of field and forest account chiefly for this; but the relation of the State to Hawaii has given rise to a large sugar-refining industry, while mining has created a demand for quantities of machinery and explosive materials.

The total value of manufactured products increased from \$66,000,000 in 1870 to \$213,000,000 in 1890 and \$302,000,000 in 1900. In the latter year there were over 71,000 men, 17,000 women, and 2000 children under 16 years of age employed in manufacturing, constituting in all 6.1 per cent. of the population. Of the fourteen leading branches of manufacture, five were dependent upon agriculture or horticulture. As a wheat-growing State, California early became an important flour-producer, shipping considerable quantities to China and other foreign countries; but with the change of interest from wheat to fruit, the production of flour has slightly de-

creased, as will be seen from the table appended. The canning and preserving of fruit has now become of equal importance, having almost doubled its value during the decade, and placing California first among the fruit-producing States. In the above, some vegetables are also included, such as tomatoes and peas. The manufacture of liquors, also dependent upon agriculture, is developing at an almost equally rapid rate. The high grade of grapes grown has given rise to the manufacture of wines, whose output now exceeds the total of all the other States, being estimated at \$3,900,000. But the malt liquors are as yet of greater value, being estimated at over \$5,000,000, the large supply of grain and hops giving a special advantage to this industry. Slaughtering is another thriving industry, especially the branch of it which is concerned with meat-packing, this having increased in value from \$2,400,000 to \$8,200,000. The production of factory butter, etc., although having practically begun during the decade, has already become important. The State ranks second in the production of beet-sugar, the product for 1900 being valued at \$3,500,000. Besides this, San Francisco, being the nearest port

COMPARATIVE SUMMARY OF FOURTEEN LEADING INDUSTRIES

INDUSTRIES	Year	Number of establishments	Average number of wage-earners	Value of products, including custom work and repairing
Total for selected industries for State.....	1900 1890	2,184 1,540	37,068 27,536	\$131,246,019 102,373,233

Cheese, butter, and condensed milk, factory product.....	1900 1890	178 19	402 49	3,582,942 172,579
Slaughtering.....	1900 1890	58 50	925 436	15,717,712 9,768,858
Sugar and molasses, refining.....	1900 1890	6 3	919 723	15,909,998 22,673,850
Leather, tanned, curried, and finished.....	1900 1890	45 62	1,454 1,099	7,405,981 5,729,278

of entry, secures raw sugar from Hawaii for refining. The total value of the amount refined in 1900 was estimated at \$15,900,000. Hides were formerly exported, but are now manufactured into leather within the State, and this industry has grown until the local supply of hides no longer equals the demand. The manufacturing interests originally developed in response to the demands of local mining concerns are now beginning to enter other markets. Shipbuilding is also developing. The United States battle-ship *Oregon* was constructed by a California establishment. Over two-fifths of the total product of manufactures was accredited to San Francisco; but the city had no gain during the decade. Los Angeles was the only large city that enjoyed any considerable increase, the product of that city more than doubling in value. This was partially due to the recent discovery of petroleum there, and the use of it as fuel. The foregoing table is a summary for the fourteen most important manufacturing industries in the State.

LUMBERING. California, like the other Pacific Coast States, has a remarkable wealth of forest resources; but remoteness from the market and the difficulties of transportation have delayed their exploitation. From the above table it will be seen, however, that lumbering is enjoying a steady growth. The industry centres in the Humboldt Bay region, on the Pacific Coast, but also extends along the western slope of the Sierras as far south as Fresno County. From the immense redwoods of the Pacific Slope, large quantities of lumber and shingles are manufactured, while the equally large firs are used for the building of houses and ships. Among other valuable varieties are the cedar, adaptable for finishing work and furniture; the chestnut oak, used for tanning; and the yellow pine, valuable for lumber and for the production of resin and turpentine. The deciduous trees are not great in variety, nor of much industrial value.

TRANSPORTATION AND COMMERCE. The long coast line has few excellent harbors, and the inland navigation is not extensive, being confined principally to the Sacramento River, which is navigable for small vessels as far as Red Bluff, and the Colorado, which is navigable through its entire course along the borders of the State.

Railway facilities are well developed, particularly in the great central valley. Only in the northeastern portion of the State is commercial progress seriously retarded by a lack of transportation accommodations. Two important transcontinental lines—the Southern Pacific and the Santa Fé Pacific—enter the State from the south, while a third transcontinental line—the Central Pacific—enters it a little north of the centre, San Francisco being the terminal point of all. On the Central Pacific are 33 miles of wooden galleries, known as 'snow-sheds,' and costing from \$40,000 to \$1,100,000 per mile, according to the amount of masonry needed. The San Francisco and Northern Pacific makes connection with the railway systems to the north. In 1860 the State had 23 miles of railroad, which had increased in 1880 to 2195 miles, in 1890 to 4349 miles, and in 1900 to 5750 miles. There are 0.27 mile of line per 100 square miles of land territory, and 38.72 miles per 10,000 inhabitants.

Commerce centres mainly at San Francisco, over two-thirds of all the merchandise imported to the Pacific Coast entering, and considerably over half the exports leaving, by that port. The great lumber trade of the Pacific Coast finds its chief market in that city. The other customs districts are Wilmington, San Diego, and Humboldt. There are lines of steamers to Alaska, British Columbia, Oregon, etc., and to New York, Great Britain, Hawaii, China, Japan, Australia, and South America. Its position on the Pacific Ocean gives the State an advantage in the trade with Oriental countries, which is becoming of increasing value, and contains possibilities whose full import can hardly be appreciated at present. The construction of the Isthmian canal will also be greatly to the advantage of the State, especially in its trade with European countries. The cargoes to Europe consist mainly of wheat, canned fish and fruits, honey, borax, and ores; to Asia and the islands of the Pacific, of large quantities of butter and cheese, canned and cured meat and fish; to Mexico and China, of quicksilver. Shipments across the continent include fruits (fresh, canned, and dried), cattle products, and honey. In 1900 the value of imports of merchandise to the California ports aggregated \$49,000,000, and the imports of gold and silver \$13,000,000, while the exports of merchandise and bullion were \$41,000,000 and \$9,500,000 respectively.

BANKING. In 1900 there were 39 national banks in operation, with capital aggregating \$11,000,000, deposits \$13,000,000, and reserve fund \$4,132,000. There were 178 State banks, with \$26,980,000 capital stock, \$85,880,000 deposits, and \$20,580,000 surplus. The private banks numbered 19, having \$890,000 capital and \$1,629,000 deposits. There were also 53 savings banks, with \$7,650,000 capital stock, \$158,000,000 deposits, and \$6,900,000 surplus. The average deposit in savings banks was \$730, or over 30 per cent. more than in any other State.

GOVERNMENT. The present Constitution was ratified by popular vote and became operative in 1879. A proposed amendment must have a two-thirds vote of each House, and be approved by a vote of the State electors. A proposition to revise the Constitution must likewise receive a two-thirds vote of the Legislature and the approval of the people, and the text drawn up in the resulting Constitutional Convention must also be submitted to the people for their approval.

Males who have lived one year in the State, ninety days in the county, and thirty days in the voting precinct, and have not been convicted of infamous crimes, embezzlement, or misappropriation of public money, and can read the Constitution or write their own names have the right of suffrage; but Chinese are excluded.

Legislature.—Senators (40) hold office for four years, Assemblymen (80) for two years. The Legislature meets in biennial sessions, on the first Monday of January of even years, and the pay of the members (\$8 per day and 10 cents mileage) is limited to sixty days. The Governor may convene extra sessions, but the power to legislate at these is restricted to the specified subject. The House impeaches, while the Senate acts as a court of impeachment.

Executive.—The Governor, Lieutenant-Governor, Secretary of State, Controller, Treasurer. At-

torney-General, and Surveyor-General are each elected for a term of four years. A two-thirds vote of each House overcomes the Governor's veto. Money appropriation bills may be vetoed in part. In case of a vacancy in the office of Governor, the Lieutenant-Governor takes his place, and in turn is succeeded by the president *pro tempore* of the Senate. The Governor grants reprieves, pardons, and commutations of sentence.

Judicial.—The Supreme Court, the members of which are elected for a term of twelve years, consists of a Chief Justice and six associates, and is divided into two departments, which may sit separately or as one court. Each county has a Superior Court, whose members are elected for a term of six years. Inferior courts are established by the Legislature. No judge of Supreme or Superior Court can receive his salary unless he swears that no case in his court submitted ninety days previous remains unattended to.

Local Government.—There is a uniform system of county governments, and general laws are enacted for the organization of townships. Laws affecting municipal corporations must be general laws, applying to classes of municipalities made upon the basis of population. A city containing a population of more than 3500 may frame a charter for its own government, which, after being approved by the electors of the city, is submitted to the Legislature for its approval or rejection as a whole.

Other Constitutional and Statutory Provisions.—No corporation formed under the laws of the State can employ, directly or indirectly, any Chinese or Mongolian, and contracts for coolie labor are void. Appropriations to sectarian schools are prohibited. The legal rate of interest is 7 per cent., but any rate is allowed by contract. Women may enter upon or pursue any lawful business, vocation, or profession, and the property of married women belongs to them alone.

Sacramento is the capital. The State has eight Representatives in the Lower House of the national Congress.

Finances.—The cash receipts of the State for the fiscal year ending June, 1900, amounted to \$11,147,000, the cash payments to \$9,549,000, and the balance in the treasury to \$5,020,000. The State debt on the same date was \$2,460,000, of which amount \$2,277,000 was held in trust for the State school and university funds.

Penal and Charitable Institutions.—The penal institutions are the prisons at Folsom and San Quentin, the State Reform School at Whittier (which is conducted on the cottage plan, and where farming and various trades are taught), and the Preston School of Industry at Ione City. The charitable institutions include the insane asylums at Napa, Stockton, Agnew, and Ukiah, all of which are under the control of a State Lunacy Commission; the Home for Feeble-minded Children at Glen Ellen; and the Institution for Deaf, Dumb, and Blind at Berkeley. There are also nineteen orphan asylums receiving State aid and inspection.

Militia.—According to the United States official Army Register for 1901, the total strength of the State militia is as follows: General officers, 4; general staff officers, 44; regimental field and staff officers, 33; company officers, 144; rank and file, 3059; aggregate, 3304. The force is organized into one division of three brigades

and seven regiments. There were in 1900 378,000 males of militia age, 212,000 of whom were liable for duty.

EDUCATION. California ranks among the progressive States in its educational policy. The educational system is wide in scope and thorough in administration, and the length of the school year (165 days) is exceeded in only one or two States west of the Alleghenies. The State has succeeded better than most States in dealing with the rural school problem, but still suffers from an undue multiplication of small rural districts. The compulsory school law is not generally enforced. Of 361,000 children between the ages of 5 and 17, in 1900, 266,700 were enrolled in the public schools and 23,300 in private schools. The kindergarten grades enrolled 4400; the primary grades, 170,000; the grammar grades, 82,000; and the 120 high schools, 12,100. Of the teachers of primary and grammar grades, 1100 were males and 6000 females. The average of the salaries paid to male teachers is \$81 per month, and to females, \$65.50, being much higher than the average for the Western States. The average annual expenditure for primary and grammar grades per child of school age is about \$17. About one-half of this is provided for by State apportionments, about one-third by county apportionments, and the remainder by city or district taxes and other sources.

There are five normal schools. The State University at Berkeley, an outgrowth of the State College (chartered in 1855), has a liberal endowment. Its schools of law, medicine, etc., are in San Francisco. Lick Observatory (q.v.) is also connected with it. Leland Stanford Junior University, at Palo Alto, is one of the most heavily endowed educational institutions in the world. Both of the foregoing institutions are coeducational, and in rank take their place with the foremost institutions of the country. Other colleges are: The University of Southern California, Los Angeles, with its school of agriculture at Ontario and theological school at San Fernando; the Roman Catholic colleges at San Francisco, Los Angeles, Oakland, and Santa Clara; the Pacific Methodist, at Santa Rosa; California College, at Oakland; Pomona College, at Claremont; and the University of the Pacific at San Francisco. The Cogswell Polytechnic College, at San Francisco, is maintained by the city. There are theological schools at Oakland, San José, and San Rafael; art schools at San Francisco, San Diego, and Sacramento. The California Academy of Sciences, founded in 1853, and endowed by James Lick (q.v.), is at San Francisco.

RELIGION. From an early date the Roman Catholics have been very active in missionary work. Nearly all the Spanish element of the population, and a large part of the Indian population, are members of that Church, making it numerically the strongest religious denomination. The Methodists, Presbyterians, Congregationalists, and Baptists follow, in the order named, and the other leading denominations are represented. Even with the large Catholic element, but 23 per cent. of the population are church communicants.

POPULATION. California is the most populous of the Western States, and ranks twenty-first in population among the States of the Union. The

following is the population by decades: 1850, 92,600; 1860, 379,900; 1870, 560,200; 1880, 864,700; 1890, 1,208,100; 1900, 1,485,000. (For population by counties, see table on back of the map.) The per cent. of increase for the last decade (22.9) was greater than that for the whole country. Of fifty-seven counties, all but eleven increased in population. About one-fourth of the population of the State is foreign born, the Irish, Germans, and English, in the order named, being most numerous. The State has a Mongolian population about equal to that of the rest of the United States, the Chinese numbering 45,700 and the Japanese 10,150. The former have greatly decreased in numbers, and the latter increased, during the last decade. Fifty-five per cent. of the population are males, the large predominance of this sex among the Mongolians being partly responsible for this result. The Indians number 15,300, and the negroes 11,000. Most of the Indians are taxed, and have made considerable progress in civilized life. The most decided increase during the decade was on the part of the natives born of foreign parents, this class exceeding 21 per cent. of the total population.

There are 9.5 individuals to the square mile, and a decided tendency is manifested to segregate in cities. There are twenty-four places having a population above 4000, their inhabitants constituting 48.9 per cent. of the total population, though in seven States the per cent. is higher. The following are the leading cities: San Francisco, 342,700; Los Angeles, 102,400; Oakland City, 66,900; Sacramento, 29,200; San José, 21,500; San Diego, 17,700; Stockton, 17,500; Alameda, 16,400; Berkeley, 13,200; Fresno, 12,400.

Indians.—The Indians in 1900 numbered 7654, who were located on twenty-six reservations—namely, Hupa Valley, Round Valley, Tule River, Yuma, and twenty-two mission reservations. They are from a large number of tribes, and represent at least fourteen different linguistic stocks. At least one-half of them can speak enough English to carry on ordinary conversation, and the greater number wear citizens' clothing. They are, as a rule, self-supporting, rations being issued only to the old and infirm. In some of the reservations, not only stock-raising, but farming and fruit-growing, have attained a considerable development. The Indians of the Yuma Reservation are the most primitive in the State, living principally upon fish and the mesquit-bean, which abound on the reservation.

HISTORY. The name California first appears in a Spanish romance, published in 1510, as that of an island lying somewhere in the western sea near the equator. The term was originally applied to what is now Lower California, which was visited by the Spanish as early as 1533. Later the name was extended to the whole western coast of North America below the parallel of 42°, and the distinction of Upper and Lower California was introduced. The first exploration within the limits of the State was done in 1542 and 1543, when Cabrillo visited the coast and islands of the Santa Barbara region. In 1579 Sir Francis Drake coasted as far as the forty-eighth degree of latitude, and named the country New Albion, but did not, as is generally supposed, enter the Bay of San Francisco. In 1602 and 1603 Vizcaino explored the bays of San Diego

and Monterey, and sailed as far north as Point Reyes. The Spanish attempted to civilize the country by the establishment of missions along the coast. In 1769 the first mission in California proper was erected at San Diego by the Franciscans, and by 1823, when the last and most northerly station had been planted at Sonoma, these religious houses had grown to 21 in number, and acquired great wealth in olive, orange, and grape plantations, and cattle and horse ranches. The Indians were reduced to a state of infantile tutelage. They were treated not unkindly, and were even made acquainted with the rudiments of the Christian religion, but they failed to profit by the Spanish rule, and disease played havoc with their numbers. The Spanish Government, which intended eventually to turn the mission estates into administrative districts, never acknowledged the title of the priests to the land, and in 1777 began the founding of pueblos or towns. Upper California was divided into the four provinces of San Diego, Santa Barbara, Monterey, and San Francisco. After the Mexican Revolution of 1821, the missions began to decline. The Indians were partly emancipated in 1826, and the process of secularization, which began in 1833, was completed by 1845. Commerce with foreign nations, which was at first forbidden, became very large after 1822. In 1826 the first American immigrant wagon train entered California. In 1840 Monterey was made the capital, and a year later the Russians, who had maintained a trading-post north of Bodega Bay since 1812, abandoned it.

Under the Mexican Republic California enjoyed virtual autonomy, and after 1840 its independence was seen to be inevitable. A silent conflict arose between those who favored ultimate annexation to the United States and the large class of property-owners who were inclined to favor the establishment of a British protectorate. In the southern part of the State, Larkin, the United States consul, was secretly endeavoring to stir up a revolt against Mexico and to bring about the extension of the jurisdiction of the United States over the country. But before his schemes had attained full maturity, a rising of the American settlers in northern California took place. On June 14, 1846, a small party of Americans, aided by John C. Frémont, who was then in California at the head of an exploring expedition, seized the town of Sonoma, raised the Bear Flag, and on the fourth of July proclaimed the independence of California. Commodore Sloat, acting under orders from the United States Government, which was then preparing to go to war with Mexico, seized Monterey and Yerba Buena (San Francisco), and the conquest of the country was completed by Commodore Stockton, Colonel Frémont, and General Kearney. On August 15, 1846, California was declared a Territory of the United States.

The discovery of gold at Sutter's Mill, near Coloma, on January 24, 1848, gave an impetus to immigration from all parts of the globe. The great body of gold-seekers, 'the Argonauts,' arrived in 1849, and by the end of the year the population exceeded 100,000. Nearly all the newcomers were unmarried men, in haste to get rich. Hence the organization of an authoritative body, responsible for public order, was neglected or hindered by the influx of lawless characters. There ensued reckless speculation, extrava-

gant living, and easy-going morality in many localities. Stable elements, however, were not wanting—the mining camps had stringent laws of their own, and lynch law was resorted to in many quarters. Life and property, however, were not well secured. The people were heavily taxed without representation, and though San Francisco had been made a port of entry and United States customs laws had been extended over the country, no Territorial government had been granted. On November 13, 1849, after several unsuccessful attempts at State-making, a constitution, in which slavery was prohibited, was adopted by the people, and on September 9, 1850, California entered the Union. (For national events connected with the State's admission, see UNITED STATES, and CALIFORNIA COMPROMISE.) In 1851 the citizens of San Francisco formed a vigilance committee to check lawlessness in that city. The committee tried offenders, banished and hanged at its discretion, and performed its duties so efficiently that in 1856 it was reorganized to meet a new outburst of public disorder and official corruption. When the Civil War broke out, California, which was thought to be contemplating secession, was exempted from furnishing troops. The Union party, however, was dominant, and contributed nearly \$1,500,000 to the Federal Government, and sent five companies of volunteers into the field.

Since the Civil War California has experienced a magnificent economic development. The completion of the Union Pacific Railroad furthered the prosperity of the State. Both from the Eastern States and from across the Pacific the tide of immigration flowed in steadily. So considerable, indeed, did the number of Chinese immigrants become that between 1870 and 1890 the Chinese question dominated State politics and influenced national legislation. In the mining districts the Chinese occupied claims which had been abandoned as exhausted by their original proprietors, or acted as cooks and menial servants. In the towns they performed various duties. Their stolid patience and their capacity for long and sustained work made them in one way ideal laborers for the development of a new country; but their extreme frugality and their willingness to work for a small wage made them formidable competitors of white labor. (See CHINESE IMMIGRATION.) In 1878 and 1879 Dennis Kearney (q.v.), a gifted agitator, taking advantage of the discontent prevailing among the lower classes of San Francisco, owing chiefly to the question of Chinese immigration, organized the Workingmen's Party, which for a short time controlled State politics and brought into being the present Constitution of California, with its many radical features. The conflict between the mining and agricultural interests over the utilization of the natural water-power of the State was removed in a great measure by prolonged and elaborate legislation on the subjects of mineral debris and drainage. In 1887 a comprehensive system of irrigation was begun, which has yielded great results. The California International Midwinter Exposition, held at San Francisco in 1894, served to illustrate the progress and prosperity of the State. Before 1860 California was Democratic in national politics. Since that date it has been Republican, with the exception of the years 1880, 1892, and

1896. In State elections California has changed from Democratic to Republican repeatedly on local issues. The trend and change of politics in California may be gathered from the following list of Governors of the State:

CALIFORNIA, GULF OF. An arm of the Pacific, separating the peninsula of Lower California from the rest of Mexico (Map: Mexico, B 2). It was originally known as the Sea of Cortez, having been discovered under his auspices and explored by himself. It is 700 miles in length, and varies in width from 70 to nearly 150 miles. It receives at its upper end the Colorado, and from the east several streams, chief of which are the Altar, Sonora, Yaqui, and Mayo. Both shores are bordered by highlands broken by the river valleys on the east, but on the west presenting an almost unbroken mountain wall. The coast-line is irregular and forms numerous small bays. The gulf has a depth ranging from 600 feet near the head to over 6000 feet near its mouth, and contains many islands, particularly in the upper part, the largest of which are Angel de la Guarda and Tiburón. On its western shores are the ports of San Felipe, San José, and La Paz; on its eastern, those of Mazatlan and Guaymas. There are pearl-fisheries on the western coast.

CALIFORNIA, LOWER, or OLD (Sp. *Baja* or *Vieja California*). A peninsula in southwest North America, forming a Territory of Mexico (Map: Mexico, B 3). It extends from about latitude 22° 40' to 32° 40' N. It is bounded by California on the north, the Pacific on the west, and the Gulf of California and the Mexican State of Sonora on the east. Its total length is over 750 miles, while its width varies from about 30 to 140 miles. Area, 58,328 square miles. The surface is generally mountainous, the peninsula being practically an extension of the Sierra Nevada and Coast Range region. At the centre is a plateau region interrupted by mountain peaks and short ranges, Santa Catalina, in the northern central part, attaining an altitude of over 10,000 feet. An eastern coast range borders the Gulf of California, and in places attains elevations considerably exceeding 6000 feet. The western coast range, bordering the Pacific, is less elevated and seldom exceeds 3500 feet in altitude. At the extreme south the peninsula terminates in an immense mountain mass, rising in San Lázaro to 8000 feet altitude. The coasts are considerably indented, but there are not many really good harbors. The principal islands are Ángel de la Guarda, off the central eastern coast, and Cedros (Cerro), off the opposite western coast. Numerous smaller islands are scattered along the southeastern coast, and a few long, narrow islands fringe the southwestern coast. The climate and vegetation of the western portion resemble those of southern California. The climate is dry and warm, the rainfall in most of the region ranging from under 10 to 25 inches, which, with a high temperature, is a small amount. Few streams occur of any importance except as irrigators. They are most numerous in the southwest. In the southern part are considerable areas of uninhabitable land. Population, in 1895, 42,245.

CALIFORNIA, SOUTHERN, UNIVERSITY OF. A Methodist Episcopal educational institution, situated at Los Angeles, California. The university was founded in 1880, and in 1901 had endowment and productive funds amounting to about \$130,000, buildings and grounds valued at \$70,000, an income of about \$12,000, and a library of 4000 volumes and 3000 pamphlets. At the same time the collegiate and preparatory faculty numbered 92, and the total number of students, of whom over one-half were in the preparatory department, 518. In the collegiate department courses are maintained in the classics, art, oratory, music, medicine, law, and dentistry. President, George P. Bonard, A.M., D.D.

CALIFORNIA, UNIVERSITY OF. A leading American university, situated at Berkeley, California. The university was established in 1868, under the general provision for agricultural colleges made by the Congressional act of 1862, which united with it the College of California, chartered in 1869. Instruction was begun in Oakland in 1869, and the university was transferred to its present location in 1873. The government of the university is vested in the Regents of the University of California, a corporation, consisting of the higher State officers, the presidents of the State Agricultural Society, of the Mechanics' Institute of San Francisco, and of the University of California, all acting as members ex officio, and of sixteen other members appointed by the Governor of the State. The university is in effect

a State institution, receiving various State appropriations for specific purposes, and in addition receiving the benefits of a tax of 2 per cent on each \$100 of assessed valuation. As a State institution, it is obliged to make reports to the Legislature, and to be under that body's general jurisdiction.

The university comprises the following departments of instruction: In Berkeley, the colleges of Letters, Social Sciences, Natural Sciences, Commerce, Agriculture, Mechanics, Mining, Civil Engineering, and Chemistry; on Mount Hamilton, in Santa Clara County, the Lick Astronomical Department; in San Francisco, the Mark Hopkins Institute of Art, Hastings College of Law, Medical Department, Post-Graduate Medical Department, Dental Department, California College of Pharmacy. Among the colleges at San Francisco, the Institute of Art, founded by Edward F. Searles in 1893, is occupied by the San Francisco Art Association, affiliated with the university and maintaining the California School of Design, founded in 1874. The Medical Department was organized in 1873 by the absorption of the Toland Medical College. The Post-Graduate Medical Department (the San Francisco Polyclinic) was affiliated with the university in 1892. The Dental Department was organized in 1888. The Lick Observatory on Mount Hamilton was founded in 1875 by James Lick, who devoted \$700,000 to the purpose, among other things, of constructing "a telescope superior to and more powerful than any telescope ever made." The Department of Anthropology, organized primarily for research, conducts excavations in Egypt, Peru, and North America, and pursues linguistic and ethnological investigations.

In consideration of its official relation to the State and of the funds given to it yearly by the State, the University of California makes no charge to students resident in California for courses in the colleges of Letters, Social Sciences, Natural Sciences, Commerce, Agriculture, Mechanics, Mining, Civil Engineering, and Chemistry. The instruction in all the colleges is open to properly qualified persons, without distinction of sex. Students not residents of the State are charged a nominal fee for tuition. Since 1888, when its total student body numbered only 306, the university has grown very rapidly. A large part of this growth should probably be ascribed to the establishment and equally rapid growth of Leland Stanford Junior University, by which a friendly rivalry in educational matters was instituted. In 1902 there were 4006 students enrolled in the University of California, of whom 952 were in the College of Social Sciences, 284 in the College of Letters, 248 in the College of Mining, 194 in the College of Natural Sciences, 190 in the College of Mechanics, 186 in the Mark Hopkins Institute of Art, 156 in the Medical Department, and 171 in the College of Chemistry, 825 in the summer session, and 37 in the short course in dairying. The undergraduates numbered 2248, the graduate students 230, omitting summer-session students. At the same time there were 481 professors, instructors, lecturers, and administrative officers, of whom 201 were in the academic department. Nearly one-half of the university's students are women. A relatively large proportion of the students pursue the general academic courses, as compared

with the technical or professional courses. It is to be noted, furthermore, that a relatively large proportion choose courses which may be termed humanistic; those namely in languages, literature, history, and philosophy. Hardly more than 5 per cent. of the student body are non-residents of the State.

In 1896 Mrs. Phoebe A. Hearst, already a large benefactor of the university, offered to bear the expenses of an international architectural competition for the purpose of securing a general plan for a great campus on the Berkeley site; and Mrs. Hearst also agreed to erect two of the necessary buildings thereon. Preliminary competitive plans were voted upon by an international jury at the Royal Museum of Fine Arts in Antwerp in 1898. The successful candidates then prepared final plans, and these were voted upon by the same jury in San Francisco in 1899. The final plan adopted was that of M. Emile Bénard, of Paris. The plan provides not only for a campus, but for a complete series of university buildings. The estimated cost of carrying out the plans in their entirety is from \$10,000,000 to \$12,000,000. Mr. John Galen Howard, of New York, has been appointed supervising architect. The first building which he will erect will be the Hearst Memorial Mining Building.

The present value of the buildings and grounds belonging to the University of California is (1901) \$4,516,824. Its endowment and special funds aggregate \$3,035,027, and its total income derived from all sources is about \$550,000. The library contains over 88,000 volumes, but a strong effort is being made to increase this number largely, since the university, separated as it is from the book centres of the East, stands in relatively greater need of books than would an Eastern university.

The presidents of the university have been Henry Durant, Daniel C. Gilman, John LeConte, W. T. Reid, E. S. Holden, Horace Davis, Martin Kellogg, and Benjamin Ide Wheeler, Ph.D., LL.D., formerly professor of Greek and comparative philology in Cornell University, elected in 1899.

CALIFORNIA POPPY. See ESCHSCHOLTZIA.

CALIG'ULA. A tragedy by John Crowne, published in 1693 with a dedication to the Earl of Romney, and written in rhymed heroics.

CALIGULA, GAIVS CÆSAR AVGVSTVS GERMANICVS (12-41). Emperor of Rome from A.D. 37 to 41. He was the youngest son of Germanicus (nephew of Tiberius) by Agrippina, and was born August 31, A.D. 12, at Antium, and was educated in the camp, where the soldiers gave him the nickname Caligula, from the military boots (*caligæ*) which he wore. On the death of his brother Drusus, he was made augur in his stead; and on the death of Tiberius (A.D. 37), who, it was suspected, had received foul play at his hands, it was found that he had been appointed co-heir along with the grandson of Tiberius, but the Senate and the people allowed Caligula supreme and sole authority. In the beginning of his reign he appeared hardly likely to fulfill the threat of Tiberius, who had talked of educating Caligula "for the destruction of the Roman people." He was, to appearance, lavishly generous and merciful, pardoning even those who had been the instruments of cruelty against his own fam-

ily. But this ostentatious magnanimity was itself a disease, an unwholesome affectation, founded on no principle, or even humanity of heart, and co-existed with the most savage voluptuousness and lust. Consequently, when illness, the result of his vicious life, had weakened his faculties, the lower qualities of his nature obtained the complete mastery. In addition to the senseless prodigality with which he commenced his career—expending in one year the enormous wealth left by Tiberius, 720,000,000 sesterces—he began to manifest the most barbarous propensities. He banished or murdered his relatives, excepting his uncle Claudius and sister Drusilla (with whom he carried on incestuous intercourse); filled Rome with executions, confiscating the estates of his victims; amused himself, while dining, by having victims tortured and slain in his presence; and uttered the wish "that all the Roman people had but one neck, so that he might decapitate Rome at a blow!" To vie with Xerxes, he made a bridge of ships over the bay between Baïæ and Puteoli (a distance of three Roman miles and 600 paces), and celebrated the exploit by a costly banquet on the middle of the bridge, and by collecting on it great numbers of people, and causing them to be drowned. His favorite horse was stabled in a palace, fed at a marble manger with gilded oats, was made a member of the college of priests, and afterwards raised to the consulship. As a climax to all his absurdities, he declared himself a god, and had temples erected, and sacrifices offered to himself. At length a conspiracy was formed by the officers of his guards, and he was assassinated A.D. 41. His life is told by Suetonius. See also Baring-Gould, *The Tragedy of the Cæsars* (London, 1892).

CALIGULA, BRIDGE OF. A so-called bridge prepared by Caligula to facilitate his passage from his palace on the Palatine Hills to the Temple of Jupiter on the Capitol. In reality, the 'bridge' consisted of wooden passageways leading across the streets, from roof to roof of intervening buildings.

CALIGULA, PALACE OF. The home of Caligula on the Palatine Hills overlooking the Forum. The palace was an extension of the palace of Tiberius, built over the site of the houses of Cicero and other rich men, and rising from the Nova Via to a height of 150 feet on substructures, to which the extant ruins belong. The superstructure has entirely disappeared. The best preserved portion of the remains is the crypt-porticus in which Caligula was murdered on January 24, A.D. 41.

CALINGA, ká-lén'gá. A name under which various wild natives of northern Luzon are sometimes grouped. See PHILIPPINES.

CALIPERS (corrupted from *calibre*; see CALIBRE). An instrument for measuring the diameter or thickness of objects. If a pair of ordinary dividers be applied to an object so that the extreme points of the diverging legs embrace it, the distance between the points of the two legs will be the exact thickness of the object, and this distance can be determined in the usual units of length by applying the points to a scale and reading off the space subtended by them. This is the simplest form of calipers. If the dividers have a graduated arc attached, so arranged that it records exactly the distance

apart of the points of the legs, we then have a registering calipers. Calipers of this general form are made in a variety of shapes and with a variety of registering and adjusting devices for special purposes. Generally the legs, instead of being straight like the legs of dividers, are curved

1. SIMPLE CALIPERS.

so as to converge toward each other at the extreme points. Fig. 1 shows a form of calipers for rough measurements such as measuring the diameter of rolled rods or the thickness of rolled plates. Fig. 2 shows a form of calipers, known as micrometer calipers, for very precise measure-

FIG. 2. MICROMETER CALIPERS.

ments. The mechanical principle embodied in the construction is that of a screw in a fixed nut. An opening to receive the work to be measured is afforded by the backward movement of the screw, and the size of the opening is indicated by the graduations. The pitch of the screw, or distance between its threads, is forty to the inch in this particular calipers, and the graduations on the barrel are forty to the inch and are figured 0, 1, 2, etc., at every fourth division. As these graduations conform to the pitch of the screw, each division equals the longitudinal distance traversed by the screw in one complete revolution, and shows that the calipers has been opened $\frac{1}{40}$ or $\frac{1}{1000}$ of an inch. The beveled edge of the thimble is graduated into twenty-five parts and is figured at every fifth division, 0, 5, 10, 15, 20, etc. Each division when coincident with the

FIG. 3. VERNIER CALIPERS.

base-line of the divisions on the barrel indicates that the gauge-screw has made $\frac{1}{40}$ of a revolution and that the opening of the calipers has increased $\frac{1}{40}$ of $\frac{1}{1000}$ or $\frac{1}{40000}$ of an inch. Hence to read the calipers multiply the number of divisions visible on the scale of the barrel by 25, and add the number of divisions on the scale of the

thimble from zero to the line coincident with the base-line of the graduations on the barrel. For example, as the calipers is set in the illustration, there are three whole divisions visible on the barrel. Multiplying this number by 25 and adding 5, the number of divisions registered on the scale of the thimble, the result is $\frac{775}{1000}$ of an inch. There are also special forms of micrometer calipers for the accurate measurement of V-threads on screws, bolts, etc., and calipers for measuring the depths and thickness of gear-teeth and other purposes. A common form of calipers, known as vernier calipers, is shown by Fig. 3. (See VERNIER.) See GAUGES.

CALIPH (Fr. *calife*, Ar. *khalifa*, successor, from *khalafa*, to succeed). The title of Mohammed's successors in temporal and spiritual power, from which the early Empire of Islam is known as the Caliphate. While the first impulse of conquest given to the Arabs by the new faith endured, the power of the caliphs was vast, covering the whole world of Islam; but with time the usual consequence followed the combining of spiritual authority with temporal dominion. The caliphate became the subject of factional strife and a prize for ambitious leaders, and rival dynasties broke Islam up into independent powers united only in enmity to the unbeliever. The first four caliphs (632-661), Abu Bekr, Omar, Othman, and Ali, were generally recognized as true successors to the spiritual authority of the Prophet, all being members of his immediate family, though under Ali, who was assassinated, there were insurrectionary movements. The Omniads (661-750) held a more doubtful title, but still one that was recognized. With the accession of the Abbassides the Mohammedan world was divided, a survivor of the Omniads founding in Spain the emirate (later caliphate) of Cordova. This was never a true caliphate according to Mohammedan law, but it was one of the greatest in wealth and civilization of all the Mohammedan empires. The Abbasside dynasty saw other rivals arise, the Aglabites and Edrisites in Africa, as well as minor claimants. It was the story of the feudal world everywhere—emirs seizing sovereign power whenever the opportunity offered. From the Tenth Century on, the Abbasside caliphs were mere creatures of the powerful Turkish guards, rashly organized by the Caliph Motassem (833-842). In 1258 another Motassem, the last Abbasside caliph, was put to death by Hulaku Khan (see MONGOL DYNASTY IN PERSIA). Nominal successors of the caliphs performed the spiritual functions of the office in Egypt as late as the Sixteenth Century, when the Turkish sultans reunited the spiritual and temporal headship of Islam in their own persons. There was a Shiite (q.v.) caliphate instituted in Persia in 1502. The first four caliphs had their capital at Medina; the fourteen Asiatic Omniads made Damascus their seat of power; while Bagdad was that of the thirty-seven Abbassides. There was also established at Cairo in Egypt (909-1171) a dissenting caliphate, that of the Fatimites. Twenty-two Omniads (756-1031) of the Spanish line ruled in Cordova. See ABBASSIDES; FATIMITES; OMNIADS; and separate articles on the greater caliphs. Consult, also: Sir William Muir, *Annals of the Early Caliphate* (London, 1883), and *The Caliphate: Its Rise, Decline, and Fall* (London, 1891), an abridgment of the *Annals*, with a continuation to the fall of

the Abbassides; Weil, *Geschichte der Chalifen* (5 vols., Mannheim and Stuttgart, 1846-62); Syed Ameer Ali, *A Short History of the Saracens* (New York, 1899); S. Lane Poole, *The Mohammedan Dynasties* (London, 1894).

CALIPPIC CYCLE. See PERIOD.

CAL'ISA'YA BARK. See CINCHONA.

CALIS'TA. (1) The vengeful wife of Altamont and mistress of the 'gay' Lothario, in Rowe's *Fair Penitent*. The rôle was a great favorite with Eighteenth Century actresses. (2) The wife of Cleander in Massinger and Fletcher's *Lover's Progress*. She is possessed of an intense passion for Lysander, but still remains true to her husband. The character was largely suggested by Caliste, in Daudiguier's *Lysandre et Caliste*. (3) The lady-in-waiting and confidante of Queen Berengaria, in Scott's *Talisman*. She assists in a silly and dangerous trick against Sir Kenneth, by which he is lured away from guarding the royal standard.

CALISTHENICS. See GYMNASTICS.

CALIVER (from Fr. *calibre*, calibre, bore; see CALIBRE). A matchlock or firearm about midway in size and character between a harquebus (q.v.) and a musket, and small enough to be fired without a rest or support. It could be discharged much more rapidly than a musket, but did not do as much execution. It was introduced in the Sixteenth Century and received its name from the fact that the bore was of uniform *calibre*, so that the common stock of bullets for a company might fit all weapons.

CALIXTINES, ká-lik's'tínz. A name given (1) to the conservative wing of the Hussites (q.v.) (from Lat. *calix*, cup, chalice), because they contended for lay communion in both kinds; (2) to the followers of Georg Calixtus (q.v.) in the latter half of the Seventeenth Century.

CALIXTUS. A name borne by three Popes. CALIXTUS I. Bishop of Rome from 219 to 223. He was born a slave.—CALIXTUS II. Guido of Vienne. Pope from 1119 to 1124. He was a son of the Count of Burgundy. He expelled the Anti-Pope Gregory from Rome in 1120, stormed the castle in which he took refuge, and made him a prisoner. He concluded with Henry V. of Germany the famous Concordat of Worms (1122), by which the long dispute over the question of investiture (q.v.) was adjusted.—CALIXTUS III. Alonzo de Borja or Borgia. Pope from 1455 to 1458. His leading idea was to institute a great crusade against the Turks, in which he failed.

CALIXTUS, GEORG (1586-1656). A German Lutheran theologian. He was born at Medelbye in Schleswig, and studied at Flensburg and Helmstädt. After traveling as an earnest student for four years in Germany, Holland, England, and France, where he made the acquaintance of the most learned men of his time, he returned to Helmstädt in 1613, and in the following year was appointed professor of theology. His genius, the depth of his knowledge, and his large experience of the world and of men, which he had acquired in his travels, developed in him a spirit of great tolerance toward all who held their religious opinions honestly, whatever these might be. Although his dissertations on the Holy Scripture, transubstantiation, communion in one kind, etc., are acknowledged by learned Catholics to be the most solid and admirable which have

been composed by Protestants against the distinctive doctrines of Catholicism, he was, on account of some statements in his work entitled *De Præcipuis Religionis Christianæ Capitibus*, which seemed favorable to Catholic dogmas, and of others in his *Epitome Theologiæ Moralis, De Tolerantia Reformatorum*, etc., which approached too near to the Reformed or Calvinistic standpoint, declared guilty of abominable heresy by the adherents of the letter of the Concordienformel—i.e. the orthodox and dogmatically rigid Lutherans. Calixtus felt keenly that the polemical harshness of Lutheranism was a serious obstacle in the way of a great catholic Christianity, and that Protestantism must assume another form before it could hope to become the religion of Europe. Under this conviction, Calixtus endeavored to show that the oldest and most fundamental articles of the Christian faith—viz. the facts embodied in the "Apostles' Creed"—were common to all Christian sects. In subsequent dissertations, having stated that the doctrine of the Trinity was less distinctly taught in the Old than in the New Testament, and that good works were necessary to salvation, and finally, at the religious conference of Thorn in 1645, whither he was sent as a mediator by the Elector of Brandenburg, having been on more intimate terms with the Calvinistic than the Lutheran theologians, Calixtus was accused of apostasy. Fortunately, however, he had powerful friends, who stood firmly by him, and through their help he was enabled to retain his professorial chair till his death in Helmstädt, on March 19, 1656. For his biography, consult: E. L. W. Henke, *Calixt und seine Zeit* (Halle, 1853-56); W. C. Dowding, *German Theology During the Thirty Years' War*; and *The Life and Correspondence of G. Calixtus* (London, 1863).

CALKIN, ká'kín, JAMES (1786-1862). An English organist and composer, born in London. He studied under Thomas Lyon and Dr. Crotch; was organist of the Regent Square Church, Gray's Inn Road, for thirty years, and was prominently identified with the Philharmonic Society in its early years, serving for some time as one of the directors. His compositions include a symphony for orchestra, an overture, several string quartets, and numerous pianoforte pieces.

CALKING, ká'k'ng (probably OF. *cauquer*, to tread, from Lat. *calcare*, to tread in, from *calo*, heel). A process in which oakum is forced into the seams between the planks of a deck or the sides of a wooden ship in order to prevent the entrance of water. After the seams are spread, as much oakum is forced in as possible until they are nearly filled. They are then payed (i.e. filled up) with pitch, cement, or putty. Special chisel-shaped tools are used in calking, called *calking-irons*, *making-irons*, *raising-irons*, and *reeming-irons*. The edges of iron plates are also made water-tight by calking. In the case of flush edges or butts the calking-tool commonly straddles the seam; but when one plate laps another its edge is driven down by the tool against the under plate.

CALL. A term often used in reference to various theological and ecclesiastical subjects. (1) The command or invitation to believe in Jesus Christ is designated the *call of God*, or the *Gospel call*. Calvinistic theologians make a

distinction between a *general* call and a *special* or *effectual* call. The former is addressed, they say, to all to whom the word of God comes; but it is insufficient of itself to induce any man to the act of faith, and requires for its efficacy that it be accompanied by the special and irresistible grace of the Holy Spirit. They are careful, however, to state that the general or outward calling by the word always precedes and accompanies the special and effectual calling of the Spirit. The notion of an inward call by the Spirit of God in the soul, unconnected with outward calling by the word, belongs not to Calvinistic, but to mystic theology. (2) A call to office in the Church, and particularly to the ministry of the Gospel, is regarded by Christians generally as proceeding from God; and the Church of England requires of candidates for ordination an express profession that they trust they are so moved of the Holy Ghost. (3) A call by the people who are to be under the pastoral care of a minister has been generally regarded in the Christian Church as necessary to the establishment of the pastoral relation. In established churches the matter has been complicated by patronage rights. Often in the Church of England the local congregation has had no voice whatever in the call of its minister. In Scotland the question has given rise to some of the principal ecclesiastical divisions. In the Established Church the formal acceptance of the nominated minister by the people was always professedly sought. The 'Free' Churches of England and Scotland, however, have alone secured the true supremacy of the congregation. In America, almost all denominations professedly give the call of the minister entirely into the hands of the local church or congregation; and where not professedly, even there it is actually so placed in most bodies, and the tendency is every day stronger toward the complete autonomy of the local body in this matter. See PRESBYTERIAN; CONGREGATIONALISM; METHODISM; CHURCHES.

CALL. When subscriptions to a joint stock enterprise do not require payment at once of the full amount of shares, it is frequently provided that a certain proportion shall be paid in cash, the remainder being subject to call upon the part of the management. The term call is also applied to the amount of these delayed payments. See PUTS AND CALLS.

CALL, WILKINSON (1834—). An American lawyer and politician. He was born in Russellville, Ky., but early in life went to Florida, where he became a lawyer. In the Civil War he rose to the rank of adjutant-general in the Confederate Army. He was elected to the United States Senate in 1865, but was not permitted to take his seat. In 1879 he was again elected, and thereafter served continuously, as a Democrat, until 1897.

CALLA (Lat., an uncertain plant). A genus of plants of the order Araceæ. The genus *Calla* is characterized by a flattened spathe within which is a cylindrical spadix covered with naked flowers, appearing as a mere mixture of stamens and pistils. The only species, *Calla palustris*, is found in swamps in Europe, Siberia, and North America, but not in Great Britain. It has a creeping rootstock, and heart-shaped, stalked leaves, prolonged into a point; the spathe is

white, and the spadix yellow. The rootstock is extremely acid; but, being deprived of its acidity by grinding, boiling, and macerating, is made by the Laplanders into a kind of bread called *missebroad*, which they hold in high estimate. The well-known and beautiful calla-lily (*Reticularia Ethiopica*) was formerly included in this genus.

CALLAO, ká-lyá'ó (Sp. *cala*, creek, bay, from Celt. *cala*, harbor). The principal seaport of Peru and capital of the small province of the same name, situated on Callao Bay, seven miles west of Lima, with which it is connected by rail (Map: Peru, B 6). The modern city, a short distance to the north of the original town, which was destroyed in 1746, is divided into two sections, the older occupying the centre and having, to a great extent, narrow and crooked streets, while the surrounding portion is well laid out with broad avenues crossing at right angles. The buildings of the city are not particularly notable from an architectural standpoint. Callao enjoys a healthful, temperate climate. The harbor, though an open roadstead, is safe and spacious, being protected by the natural breakwater afforded by the island of San Lorenzo. It is fortified, and possesses splendid docking and ship-repairing facilities, which include a floating dock, 300 feet in length. Railway lines approach the docks. Callao has manufactures of refined sugar, lumber, and iron; but is more important as a commercial centre, its exports comprising minerals, sugar, hides, wool, bone, cotton, cocoa, etc., and the chief imports, manufactured articles, coal, and beer. The commerce has shown a considerable decrease since the decline of the guano trade. In 1900 nearly 1000 vessels (of over 50 tons), aggregating 1,315,000 tons, entered and cleared at the port of Callao. Population, in 1896, 48,118.

Callao figures in history from the times of the early Spanish conquest. It was considered a fair prize by the pirates who infested the western coast of America in the Sixteenth Century and later, and by them it was attacked several times. By 1671 it had become of sufficient importance to merit the dignity of a city. An earthquake of 1687 was followed by the more disastrous commotion of 1746, which, with the accompanying tidal wave, destroyed the city and occasioned great loss of life. About the middle of the Eighteenth Century Callao was strongly fortified, San Felipe Castle playing a prominent part in subsequent wars. In 1826 the Spanish were driven from the city, their last foothold in continental America. Callao was bombarded by a Spanish fleet in 1866, and in 1880 by the Chileans, into whose power it fell the next year, after the battle of Miraflores. The treaty of 1883 restored it to Peru.

CALLAWAY, kál'a-wá, SAMUEL RODGER (1850—). An American railway president, born in Toronto, Canada. In 1864 he entered the service of the Grand Trunk Railway, in 1875 rose to be superintendent of the Detroit and Milwaukee Railway, and 1880 became manager of the Chicago and Grand Trunk. He was vice-president of the Union Pacific from 1884 to 1887; president of the Toledo, Saint Louis and Kansas City line in 1887-95; and of the New York, Chicago and Saint Louis in 1895-97. He was subsequently president of the Lake Shore and Michigan Southern, from 1897 to 1898, and

of the New York Central and Hudson River Railway from 1898 to 1901, and in 1901 was chosen president of the American Locomotive Company.

CALLCOTT, kəl'kot, Sir AUGUSTUS WALL (1779-1844). An English landscape painter, born in London. He studied at the Royal Academy, and first devoted himself to portrait painting. After 1807 he exhibited nothing but landscapes for many years. In 1810 he was made a member of the Royal Academy, was knighted in 1837, and in 1844 was made conservator of royal pictures. His landscapes are remarkable for their beauty, clear definition of objects, good drawing, and truthful natural coloring. He has been called the English Claude. Among his pictures are: "Entrance to the Pool of London" (1816); "The Mouth of the Tyne" (1820); and among his figure paintings, "Milton Dictating to His Daughters" (1840) is noteworthy.

CALLCOTT, JOHN WALL (1766-1821). An English composer, born in Kensington. Too nervous to be a surgeon, as he had intended, he devoted his attention to music, and in 1785 won three of the four gold medals annually given by the Catch Club, the admired "O Sovereign of the Willing Soul" being one of the successful pieces. During the next ten years he obtained twenty of the medals given by the same society. In 1785 he was made bachelor, and afterwards (1800) doctor of music at Oxford. He studied composition with Haydn in 1790. In 1797 he issued a prospectus of an exhaustive musical dictionary, but because of his poor health could not undertake the work itself. In 1806 he published his *Musical Grammar*; in the following year his mind gave way under the continuous strain to which it had been subjected. He recovered again, but only for three years, when he relapsed, and continued insane until his death. He was one of the most eminent composers belonging to the British school of music, and especially celebrated for his glee compositions. His choicest productions were published in two volumes by his son-in-law, Mr. Horsley, in 1824.

CALL DUCK. A small beautiful breed of domestic ducks, bred in a gray and in a white variety, mainly for show purposes. The object is to make them as small and beautiful as possible. See **DUCK**.

CALLEJA DEL REY, kál-lá'há dēl rā'ē, FELIX MARIA, CONDE DE CALDERÓN (1750-1820). A Spanish general, born at Medina del Campo. He was sent to Mexico and after Hidalgo revolted defeated him near Guadalajara in 1811. In 1812 he captured the fortress of Guanajuato and murdered the revolutionists. A little later he captured Hidalgo's successor, Father Morelos, who was shot. For his cruelty in these operations Calleja was called 'the Butcher.' He was viceroy of Mexico in 1813-16, and was later ennobled. In 1819 he was selected to conduct the expedition against the Independents of Paraguay, was taken prisoner, and died soon after his release.

CALLET, ká'lá', ANTOINE FRANÇOIS (1741-1823). A French historical and portrait painter. He was born in Paris, where he obtained the first prize, in 1764, for his "Biton and Cleobis," afterwards exhibited at the Ecole des Beaux-Arts. He became a member of the Academy in 1780, soon after he had painted the fresco,

"Spring," for the Apollo Gallery in the Louvre. He painted portraits of Comte d'Artois, Louis XVI., Louis XVIII., and his other works include: "Winter, or Saturnalia" (1783); "Autumn, or Fête of Bacchus" (1787); "Summer, or Fête of Ceres" (1789); "Spring, or Worship of Juno Lucina" (1791)—all of which are in the Louvre.

CALLIAS (Gk. Καλλίας, *Kallias*). (1) The son of Phænippus, and one of a noble and wealthy Athenian family, the members of which were hereditary torchbearers at the Eleusinian Mysteries. He was an opponent of Pisistratus, and a successful contestant in the Olympic and Pythian games. (2) The son of Hipponicus and grandson of the preceding. He was present, dressed in his priestly robes, at the battle of Marathon. He is said to have been sent, in B.C. 449, as an ambassador of Athens to Artaxerxes, and to have negotiated a treaty most unfavorable to the Persians. On his return he was impeached for having taken bribes, and fined 50 talents. (3) The son of Hipponicus and grandson of the preceding, notorious for his extravagances and profligacy. In B.C. 392 he served at Corinth, on the occasion of the defeat of the Spartan *mora* by Iphicrates, and was one of the envoys empowered to negotiate peace with Sparta, in B.C. 371. The scene of Xenophon's *Symposium*, as well as that of Plato's *Protagoras*, is laid at his house. He died in poverty.

CALLICRATES (Gk. Καλλικράτης, *Kallikratēs*). A Greek architect of the Fifth Century B.C., who, together with Ictinus, built the Parthenon on the Acropolis at Athens.

CALLICRATIDAS (Gk. Καλλικρατίδας, *Kallikratidas*). A Spartan, the successor of Lysander in command of the Lacedæmonian fleet against the Athenians (B.C. 406). After defeating Conon in the harbor of Mitylene, and taking thirty of his ships, and subsequently capturing the fleet of Diomedon, he was defeated, and perished by drowning in the battle of Arginusæ. When Callicratidas took command of the Lacedæmonian fleet, he was greatly hampered by the impediments thrown in his way by his predecessor. He overcame these, however, and proved himself a man of vigorous character and genuine Pan-Hellenic feeling.

CALLIÈRES BONNEVUE, ká'lyar' bŭn'vū', LOUIS HECTOR, Chevalier de (1639-1703). A French army officer. He was Governor of Montreal in 1684, and in 1687 was leader of a part of the French and Indian forces which invaded the territory of the Five Nations in New York. He visited France to urge the seizure of New York as necessary to maintain French supremacy in Canada. In 1699 he was made Governor-General of Canada.

CALLIMACHUS (Gk. Καλλίμαχος, *Kallimachos*). An Athenian artist who lived near the close of the Fifth Century B.C. He made a famous gold lamp, which burned night and day in the temple of Athena Polias, on the Athenian Acropolis. He is also said to have originated the Corinthian capital. His sculptures were marked by exceeding delicacy and refinement of execution, and there is reason to believe that he was a follower of Calamis, and the first of the archaistic artists. Consult Furtwängler, *Meisterwerke der griech. Plastik* (Leipzig, 1893).

CALLIMACHUS (c.310-240 B.C.). A celebrated Alexandrine poet and grammarian. He was born in Cyrene, of a distinguished family, which traced its ancestry to Battus, the founder of that city. With Aratus of Soli he studied at Athens, and then began teaching at Alexandria, where he enjoyed the favor of Ptolemy Philadelphus and his successor, Ptolemy Euergetes. About B.C. 260 he was appointed librarian, and held the office for some twenty years. By his teaching and writing Callimachus exerted a great influence on his time. Among his pupils were some of the most celebrated scholars of the day—Eratosthenes, Aristophanes of Byzantium, Apollonius of Rhodes, and others.

According to Suidas, he left behind him over 800 books. Of his learned works in prose, the most important were his *Tablets* (Πίνακες, *Pinakes*), in 120 books. This was a great catalogue of the works contained in the library, the authors arranged according to subject matter and date, with brief observations on the size and genuineness of the works. Through this Callimachus became the founder of the critical study of Greek literature. We know, also, of a collection of glosses, of *Memorabilia* (Τρομμήματα, *Hypomnemata*), and other minor works. As a poet he won chief distinction through his elegies, so that Quintilian calls him *elegiæ principem*. His strength lay, however, in his art and learning, not in poetic genius. As an illustration of his learning may be named his four books of *Causæ* (Αἰτίαι), in elegiac measure, which treated of the founding of cities, the origin of ceremonies, etc. One of the most famous of his elegies was *Berenice's Lock* (*Coma Berenices*), written B.C. 246, in honor of Queen Berenice, and preserved to us in Catullus's translation, No. 66. Ovid also imitated his *Ibis*, in which he had attacked his rival, Apollonius Rhodius. Famous, also, in antiquity, was his idyllic poem *Hecate*, reminiscences of which are preserved in Ovid's story of Philemon and Baucis (*Met.* 8, 610ff.). Some verses of this have recently been recovered from a wood tablet found in Egypt. There are extant in a complete state only six hymns, one of which is in elegiac form, and sixty-four epigrams. These are best edited by Meineke (Berlin, 1861) and Wilamowitz (Berlin, 1882). For the newly discovered verses of the *Hecate*, consult: Gomperz, *Aus der Hecate des Kallimachos* (Vienna, 1893); *Sammlung Papyrus Erzherzog Rainer*, Vol. VI.

CALLING THE DIET. The term used in the Scotch criminal law as equivalent to arraignment (q.v.), although the forms are different from those followed in an arraignment. In Scotland, excepting in cases of high treason, there is no indictment by grand jury, but all prosecutions for the public interest before the High Court of Justiciary, and before the sheriff's court, where the sheriff is sitting with a jury, now proceed on indictment in the name of the lord advocate. Before a prisoner can be tried the charge preferred against him must have been served fifteen days before the trial, with a list of witnesses to be examined against him, and also of the jury panel. He is therefore presumed to know the nature of the charge against him; but if it be desired by him, or by his counsel, the clerk in the first instance reads the indictment aloud in open court, the same being a formal and

orderly statement of the facts which the prosecutor is prepared to prove. The prisoner is then called upon to state his objections to the relevancy of the facts alleged, and is entitled to have the question of the sufficiency of the indictment disposed of by the court before being called on to plead to the facts. This is equivalent to the demurrer (q.v.) of the English and American criminal law. If the objection is sustained, the prosecution for the time fails, and the prisoner is sent back to jail to await another indictment, unless the prosecutor chooses to abandon the case against him altogether. See **DIET**; **INDICTMENT**; **VERDICT**.

CALLINUS (Gk. Καλλίνος, *Kallinos*). A Greek poet, born at Ephesus, an elder contemporary of Archilochus. He lived in the first half of the Seventh Century B.C., and was the first to give Greek elegy a political turn. The remains of his verse urge his fellow-citizens to resist the attacks of the Cimmerians, and to fight bravely in the struggle with Magnesia. Fragments are collected in Bergk, *Poetæ Lyrici Græci*, II. (Leipzig, 1878).

CALLIOPE, kâl-lî'ô-pê (Gk. Καλλιόπη, *Kalliope*, the sweet-voiced). One of the Muses (q.v.). When special functions were assigned to individual Muses, Calliope was placed over poetry, and in the later schemes she is the presiding goddess of epic poetry. In the later art she is represented with tablets or a roll. In some of the mythographers Calliope appears as the mother of Orpheus or of Linus.

CALLIOPE HUMMER. A humming-bird (*Stellula Calliope*) of the United States west of the Rocky Mountains. The male is metallic green above and whitish below, with reddish flanks, and the short tail dusky; his gorget is white, the feathers tipped with metallic purplish. It is numerous and makes its nest upon pine branches near cones, which it is made to resemble. For many interesting facts and pictures illustrative of this bird and its nidification, consult Ridgway, *The Humming-Birds* (Smithsonian Institution, Washington, 1892). See **PLATES OF HUMMING-BIRDS**.

CALLIPPUS, or **CALIPPUS**, or **ΚΥΖΙΚΤΣ** (Gk. Κάλλιππος, *Kallippos*). An astronomer of the Fourth Century B.C. He discovered the error in the Metonic Cycle (q.v.) of 19 years, and substituted one of 76 years, which he supposed to equal 940 lunar months and 27,759 days.

CALLIPPY'OUS VENUS. A famous statue in the National Museum in Naples, so called from the part of her body at which she gazes. It was found in Rome, and is said to be the portrait of a hetera.

CALLISTE'IA. See **GREEK FESTIVALS**.

CALLIRHOË, kâl-lî'r'ô-ê (Gk. Καλλιρρόη, *Kallirrhoe*). A fountain in the bed of the Ilissus, near Athens. In early times the name seems to have been given to a fountain near the market-place, where the tyrant Pisistratus erected his Enneacrounos, or fountain with nine streams. From the fountain in the Ilissus was brought the water for the marriage bath. (2) The town of Edessa (q.v.) also was called Callirrhoe. (3) The wife of Alcmena, who, yielding to her importunities, obtained from Phegeus the necklace of Harmonia and lost his life in the enterprise.

CALLISTHENES (Gk. Καλλισθένης, *Kallisthénēs*) (c.360-328 B.C.). A Greek historian, born at Olynthus. He was a nephew of Aristotle, by whom he was educated, in company with Alexander the Great. He lived for the greater part of his life at Athens, and devoted himself to the study of history. Having accompanied Alexander to the East, he incurred the latter's displeasure, and was put to death (B.C. 328), on a charge of treason. Callisthenes wrote several historical works, only fragments of which have come down to us. The work on Alexander ascribed to him is a composition of a much later date.

CALLISTO (Gk. Καλλιστώ, *Kallistō*). An Arcadian maiden, attendant upon Artemis, whose story was told with many variations by the Greek poets. Zeus won her love, but Artemis, discovering her condition while she was bathing, either transformed her into a bear or shot her. Her unborn child, Arcas, was saved by Hermes, at the command of Zeus, and gave his name to the Arcadians. The Alexandrian poet Callimachus seems to have been the first to tell how Zeus placed Callisto among the stars as the constellation of the Bear.

CALLISTRATUS (Gk. Καλλιστράτος, *Kallistrátos*). A famous Athenian orator, born at Aphidnæ. When Athens, in B.C. 377, undertook to form a new Athenian League, he took an active part in the movement. In B.C. 371 he accompanied the Athenian envoys to Sparta, where he urged the cause of peace. In B.C. 362 or 361 he was condemned to death, probably chiefly in consequence of disasters which had befallen the Athenians at Oropus. He went into exile at Methone, on the Thermaic Gulf, but later returned to Athens and was put to death. Callistratus was the most famous orator of his time, and his harangue on the matter of Oropus is said to have produced a profound impression on Demosthenes, who, as a boy, was present at its delivery.

CALL OF THE HOUSE. In Great Britain a Parliamentary proceeding pursued as late as 1838, for the purpose of insuring a full attendance of either House on occasions of extraordinary importance. It was the custom to give notice in advance that such a call would be made, and on the appointed day all members, under pain of incurring the displeasure of the House, were expected to answer to their names as the roll was read off by counties and boroughs. In the United States a call of the House is moved by the opponent of a measure which is about to be passed, for the purpose of showing that a quorum is not present.

CALLOSITIES. See CORNS.

CALLOT, ká'lò'; JACQUES (1592-1635). A French designer and engraver, born in Nancy. The family opposition to his pursuing the study of art only served as an incentive to his ambition, and after he had twice run away in order to study, and had been ignominiously brought home, he was at last permitted to go to Rome. He rose rapidly to prominence in his profession. The war scenes enacted in France at this time were portrayed by him with great vigor and freshness, in a series of pictures called "Misères et Malheurs de la Guerre." His reputation, however, rests on his etchings of genre pictures, which he treated with great originality,

life, and humor. His observation was vivid and his inventive genius, with his other artistic qualities, made him preëminent in his line of work. He felt a dissatisfaction with his own productions which made him painstaking to a degree, and impelled him to draw and draw again the subject under consideration. He died March 16, 1635. He left about 1500 prints. A complete list of his works is given in M. Heinen's *Dictionnaire des artistes*.

CALL TO THE UNCONVERTED, THE. See BAXTER, RICHARD.

CALLUNA. See HEATH.

CALLUS (Lat. *callum*, *callus*, hardened skin, hard flesh). A term in surgery for the substance that forms between the ends of broken bones during the process of repair, to hold the fragments together. It consists of new or embryonic tissue, and a large part of it is absorbed after union is complete. When the ends of the broken bones are closely approximated there is only a small bridge of callus formed between them. When the ends of the broken bones move very freely upon one another and separate widely, a large cuff or flange of callus forms, encircling and immobilizing them as a splint would. Such an ensheathing mass of callus is sometimes known as a *temporary* or *provisional callus*, to distinguish it from that portion which lies directly between the apposed fragments of bone, and which in time becomes replaced by true bony tissue. When the amount of callus thrown out is excessive, permanent injury may result to adjacent structures if subsequent absorption is only partial. Nerves and tendons may be included in the callus, or a joint may be invaded and rendered useless. Surgical operation is sometimes necessary to remove this excess of callus and restore the parts to their normal condition.

In plants, callus is a tissue usually formed in consequence of injury to woody or herbaceous stems. See ANATOMY OF PLANTS.

CALMAR, käl'mär. See KALMAR.

CALMET, kál'má', AUGUSTIN (1672-1757). A French Benedictine, and exegetical and historical writer. He was born at Mesnil-la-Horgue, near Commercy, February 26, 1672, and in 1689 entered the Order of Benedictines. In 1698 he was appointed teacher of philosophy and theology in the abbey Moyen-Moutier; in 1704, sub-prior of a convent of learned monks at Münster, in Alsace; and in 1706 he went to Paris, to superintend the publication of his *Commentary on the Bible*. He was afterwards appointed prior at Lay (1715), abbot of Saint Leopold in Nancy (1718), abbot of Senones in Lorraine (1728), and died in Paris, October 25, 1757. His exegetical writings have been commended and studied with advantage by both Roman Catholics and Protestants. The *Commentary on the Bible* (23 vols., Paris, 1707-16), though marred by the author's deficient knowledge of the Oriental languages, contains valuable researches in biblical antiquities. Calmet's *Historical and Critical Dictionary of the Bible* (4 vols., Paris, 1722-28) was translated into English, German, and other languages, and has passed through many editions. His other works—a *History of the Bible*, and of the *Jews* (1718), and a *Universal History* (1735-71)—are mere compilations; but his *History of Lor-*

raîne (Nancy, 1728, 4 vols.; 2d ed. 1745-47, 6 vols.) is founded on original researches. Solid criticism and independent judgment are wanting in all his works. For his life, consult: Fagé (Senones, 1762); A. Digot (Nancy, 1861); and on his correspondence, P. E. Guillaume (Nancy, 1875).

CALM LATITUDES. The portion of the ocean which lies between the northern and southern trades, and where calms of long duration are likely to prevail. They vary with the season of the year and the consequent shifting of the trade-wind belts. The term is also applied to the region along the polar edge of the trade-wind belts, which is called the Horse Latitudes. See **DOLDRUMS**.

CALMON, kál'môn', MARC ANTOINE (1815-1890). A French statesman. He was born in Tarniès (Dordogne), and studied law in Paris. In 1871 he became Under-Secretary of State in the Department of the Interior, and in December, 1872, he was appointed prefect of the Department of the Seine, which position he held until the downfall of the Thiers Ministry. In 1873 he was elected to the National Assembly. His valuable works on political economy include the following: *Les impôts avant 1789* (1865); *William Pitt, étude financière et parlementaire* (1865); *Histoire parlementaire des finances de la Restauration* (1868-70); *Etude des finances de l'Angleterre depuis la réforme de Robert Peel, jusqu'en 1869* (1870). He also edited Thiers's *Discours parlementaires* (15 vol., Paris, 1879-83).

CALOMARDE, kál'ô-mâr'dá, FRANCISCO TADEO, Count (1775-1842). A Spanish statesman. He was born at Vittel, in Aragon, studied in Saragossa, and became an advocate. During the wars of Napoleon he remained loyal to the national cause, and after the expulsion of the French and the return of Ferdinand VII. in 1814, Calomarde was among the first to hurry to Aragon and do homage to him as absolute monarch. As a reward of his obsequious celerity he obtained a post in the Council for the Indies, but lost it on account of accepting a bribe. On the restoration of the Constitution in 1820 he unsuccessfully courted the favor of the Liberals; but when the French Army in 1823 restored the authority of Ferdinand VII. Calomarde was appointed secretary of the *cámara del real patronato*, one of the most influential offices in the kingdom. Not long after the King made him Minister of Justice. While he held this office he showed himself an uncompromising enemy of free thought and progress, and a friend of the old ecclesiastical supremacy. He also secretly favored the party of Don Carlos, but by treating any unseasonable outbreak with great cruelty he preserved himself from the suspicion of being implicated in Carlist schemes. In 1832, when Ferdinand was supposed to be on his death-bed, he was prevailed on by Calomarde to reintroduce the Salic law, by which the Infanta Isabella was excluded from the throne, and Don Carlos, the favorite of the Absolutists, was appointed successor. The unexpected recovery of the King frustrated Calomarde's schemes, and he fled in disgrace to France. He died in Toulouse. Consult, Cardenas, *Vida de Calomarde* (Madrid, 1841-49).

CALOMEL (Gk. κάλός, *kalos*, beautiful + μέλας, *melas*, black; so called because white though prepared from black substance). The popular name given to one of the compounds of mercury and chlorine, and known as the subchloride or mild chloride of mercury, with the symbol Hg₂Cl₂. It is a heavy, white, tasteless and odorless powder, insoluble in water, ether or alcohol. It is used in medicine principally to stimulate the flow of bile in the case of a sluggish liver, or to unload the intestines (with the help of a saline cathartic), or to carry off fermenting substances in the digestive tract. It is a valuable adjunct to quinine in malarial fever. The medicinal dose of calomel is from one-half a grain to ten grains. Excessive doses, or the retention in the system of one large dose, cause swelling of the tongue and gums, and salivation. See **MERCURY**.

CALONNE, kál'ôn', CHARLES ALEXANDRE DE (1734-1802). French Minister of Finance under Louis XVI. He was born January 20, 1734, in Douai. As advocate-general, procurator-general and intendant, he had displayed many brilliant but unsubstantial qualities, when, in 1783, at the instance of his patron, Comte d'Artois, and Marie Antoinette, he was summoned by the King to become Comptroller-General of the Finances. The treasury then was in hopeless disorder, and the whole financial system of the kingdom was inadequate to meet the demands of the extravagant Court and administration. Calonne's policy, whereby he hoped to give satisfaction where the others had not, is best exhibited in his own words: "A man who wishes to borrow money must appear to be rich, and in order to appear rich it is necessary to make a display of expenditure. Economy is doubly fatal; it warns the capitalists not to lend to a treasury involved in debt; it causes the arts to languish, while prodigality enriches them." Thus he won the enthusiastic admiration of the Court, by actually encouraging that extravagance which he regarded as necessary to bolster up credit. When the Queen came to him for an unusually large sum of money, he is said to have replied: "What you wish, madame, shall be done, if it is possible; and if it is not possible—it shall still be done!" But Calonne soon found that public credit requires some more substantial foundation than mere display. Both credit and taxation had reached their absolute limits. A crisis had arrived, with which neither Minister nor King could deal. An Assembly of Notables was therefore called and Calonne opened its session in February, 1787, with a glowing account of the national prosperity, but urged the necessity of certain reforms in taxation. The Notables required an account, which revealed his mismanagement, and he was dismissed and exiled. He died in 1802. Consult the authorities referred to under **FRANCE** for this period.

CALOPHYLLUM (Neo-Lat., from Gk. κάλός, *kalos*, beautiful + φύλλον, *phyllon*, leaf). A genus of trees of the order Guttiferae, natives of warm climates. Some of the species yield valuable timber, as the piney-tree (*Calophyllum angustifolium*), which grows at Penang and in the islands to the eastward of the Bay of Bengal, attaining large proportions in ravines and narrow, moist valleys, and furnishes the beautiful straight spars called 'Poon.' The resinous products of some species are valuable, and among

them are some of the substances known by the name of Tacamahaca. *Calophyllum inophyllum* is a very large and beautiful umbrageous tree, often planted for its shade and the fragrance of its flowers, which are white and in loose axillary racemes. It is one of the most valuable timber-trees of the South Sea Islands. The timber resembles mahogany, being of equally close texture, although of lighter color, and very durable. The leaves are oblong and obtuse; the fruit is a globose drupe or stone-fruit, about the size of a walnut, and a fixed oil is expressed from its kernel, which is used for lamps, etc. In the Hawaiian Islands this oil is extensively applied to bruises and in rheumatism. A similar oil is expressed from the seed of *Calophyllum calaba*, a native of Ceylon, which also has white sweet-scented flowers, and whose timber is used for various purposes, particularly for staves, cask-headings, and house-building. Considerable difference of opinion exists as to the species producing the Tacamahaca resin and the Poon spars. The more recent authors state that *Calophyllum calaba* yields the true Tacamahaca and *Calophyllum inophyllum* a resin quite similar. Doubtless several species furnish the Poon Spars. There are a number of other species, some of which yield heavy, durable timber that is valuable for engineering purposes.

CALORIC (Fr. *calorique*, from Lat. *calor*, heat). An early term for heat, when it was considered an invisible, imponderable fluid. See **HEAT**.

CALORIC ENGINE, or **HOT-AIR ENGINE**.

An engine in which the pressure acting on the piston is produced by increasing the temperature of air through the application to it of heat by transfer through a separating metal wall. This definition distinguishes the hot-air engine from the compressed-air engine (see **COMPRESSED-AIR ENGINE**) on one hand, and the internal combustion engine (see **GAS-ENGINE**) on the other hand. There are, however, hot-air engines which employ both previous compression and internal combustion. The action of hot-air engines, like that of all other heat-engines, consists in admitting the air at a high temperature and pressure, and by allowing it to perform work on the piston reduce its pressure and temperature, after which it is either exhausted into the atmosphere and a fresh supply is introduced, or else it is again heated for a repetition of the former process. In their principal working parts hot-air engines are very similar to ordinary steam-engines. The heated air is introduced into a cylinder in which works a tightly fitting piston, which is thus compelled to move up and down and transfer its motion to a revolving shaft by means of piston and connecting rods and the other usual mechanisms of steam-engines. (See **STEAM-ENGINE**.) Hot-air engines are of several types, which may be described and explained as follows: Closed-cycle engines are those which operate continuously with the same mass or weight of air, only taking in a fresh charge to replace leakage or to increase the mass in use. Open-cycle engines are those in which at each stroke a new charge is drawn in from the atmosphere, and after being heated and expanded is exhausted again into the atmosphere. Regenerative and non-regenerative engines are those which, respectively, use or do not use a regenerator to absorb the heat of the exhaust air and to restore it to the incoming

cooler air. Finally, closed-cycle engines may be divided into two sub-classes, which differ by having the temperature change take place in the air at constant pressure or at constant volume. Each of these types is identified with the name of some designer or engineer. Hot-air engines have been designed in great numbers, but the limited extent to which they have been used makes most of them but little more than names. The hot-air engine as defined at the beginning of this article seems to have been invented by the Rev. Robert Stirling, an Englishman, in 1816. His first successful engine was built in 1827, and one afterwards was used in a foundry in Dundee, Scotland, developing 20 brake horse-power on the consumption of 50 pounds of coal per hour. In this engine, shown diagrammatically in Fig. 1, the same volume of air was alternately heated

FIG. 1. STIRLING HOT-AIR ENGINE.

and cooled, producing a variation of pressure which actuated a working piston. The heating and cooling were effected by changing the air by means of a plunger, *D*, from end to end of a cylinder, *A*, one end of which was kept hot by a fire and the other cool by a coil of water-pipe, *C*. On its way from end to end the air passed through a passage partly filled with thin plates of metal, *E*, which alternately absorbed the heat from the air and gave it back on the return. This was the first application of the economizer or regenerator, and its invention is said to be due to James Stirling, a civil engineer. This engine failed through the giving out of the heaters, which required to be kept red-hot. In 1844 Franchot, a Frenchman, patented an arrangement of the Stirling engine with large and efficient heating and cooling surfaces. Further attempts at improvement were made by Rankine and Napier, and by Professor Jenkin in England, and also by Laubrau in France. The Stirling engine belongs to the type of hot-air engines with temperature changes at constant volumes. Another hot-air engine which has much the same classic and historical interest as the Stirling engine is that invented by John

Ericsson (q.v.). The engines of Ericsson differed from the Stirling engine in that they drew their supply of air from the atmosphere at each stroke, heated it, allowed it to expand while doing work, then exhausted it again into the external air; they belonged to the type of hot-air engine with temperature changes at constant pressure. The first engine was installed in the ship *Ericsson* in 1852, but the idea dates from 1833, and it enjoys the distinction of having been built on the largest scale and of having made the most noted failure of any hot-air engine. To Ericsson is to be credited also the term 'caloric engine,' which he applied as a sort of trade name to his invention. Briefly described, Ericsson's first engine was designed for a 2200-ton seagoing ship; it was intended for 600 horsepower, but actually ran at about 300 horsepower. There were four cylinders, each 14 feet in diameter and having 6 feet stroke, and the engine ran at nine revolutions per minute. As stated above, the engine proved a failure after several attempts had been made to remedy its faults. First the 14-foot cylinders were removed and replaced by others, which also failed; and finally the engine was replaced entirely by a steam-engine. Afterwards Ericsson made another attempt to drive a ship by an air-engine. The *Primera* was built and fitted with horizontal engines drawing their supply from, and exhausting into, an artificial atmosphere of high pressure. As in the former attempt, however, the

FIG. 2. ERICSSON CALORIC ENGINE.

heating surface proved inadequate and the available pressure was too small to give much power, so that again steam was substituted after a short trial. Economizers were employed with both of his large engines, but in the small engines, to the design of which Ericsson turned his attention after the failure of his large motors, the economizer was abandoned. Ericsson's first design for a small motor was brought out in 1860, and in 1880 the latest form for pumping purposes was produced. Fig. 2 shows this type of engine.

The fire of coal or gas is below the cylinder *d*, which is water-jacketed at the upper end. *x x*. In tank pumping engines, the pumped water circulates through the water-jacket. At *A* is the hollow displacing piston, and *B* is the working piston proper. The displacer is coupled to the bell crank *k*, and so to the crank *e*, to which the beam *a* is linked directly by *g*. These engines do not use less fuel than steam-engines of similar size, but as they require no water or licensed engineer, they have come into considerable use.

The Stirling engine and the Ericsson engine between themselves embodied all the characteristic features of the several types of hot-air engines defined above. The Ericsson engine is an open-cycle, non-regenerating engine, with temperature changes at constant pressure; the Stirling engine was a closed-cycle, regenerating engine, with temperature changes at constant volume. The hot-air engines produced by other inventors of this kind of prime motor have resembled sometimes the Ericsson engine and sometimes the Stirling engine, but have had the details of operation worked out in different ways. Two of these only need be mentioned for the purpose of illustration: The Wilcox engine, of which large numbers were made about 1860 to 1865, was, like the Ericsson ship engine, an open-cycle, regenerative engine, with temperature changes at constant pressure. Its distinctive characteristic was a peculiar supply cylinder fitted with a piston operated from the main shaft. This supply cylinder took in the atmospheric air and passed it through the regenerator to the operating cylinder, where it was heated and expanded to perform its work, after which it was exhausted through the regenerator into the external air. The Merrill engine, one of which of 10 horsepower was used for some years previous to 1835 to run a factory at Winchendon, Mass., worked on the same principle as the Stirling engine: that is, it used the same volume of air over and over. It had two working cylinders, each of which was double-acting (see STEAM-ENGINE), and two reverser plungers, which affected the transfer of the air between the heating and cooling devices.

Mention was made at the beginning of this article of hot-air engines employing previously compressed air. These are commonly known as compression engines. In them a constant quantity of air is constantly changed in volume, being compressed while cold and expanded while hot. There are usually two cylinders, one cold and kept cold by a water-jacket or other means, and the other hot and kept heated by external means. The piston in the hot cylinder is generally timed from one-sixth to one-quarter revolution in advance of that in the cold cylinder, whereby the air is first changed into the cold cylinder, sometimes through a regenerator, then compressed therein, then changed to the hot cylinder back through the regenerator, taking up again the stored heat, and finally expanded in the hot cylinder. The first engine of this kind seems to have been invented by Charles Louis Felix Franchot, a Frenchman, in 1853, and it is deserving of brief mention for the clear manner in which it illustrates the working principle. Hot and cold cylinders of different areas were placed side by side, as shown by Fig. 3, with their pistons connected to cranks 135° apart. The bottom of the cold cylinder, *A*, was connected to the

top of the hot cylinder, *B*, and vice versa through heating and cooling chambers, *C* and *D*, containing Stirling regenerators. The arrangement of

FIG. 3.

the pistons was such that the air was compressed in the cool cylinder; passed through the regenerator into the hot cylinder, where it was expanded; then transferred to the cold cylinder through the cooling chamber, and the cycle repeated. From four to six cylinders, each double-acting, were proposed to be combined in a series. A model of

FIG. 4. RIDER CALORIC ENGINE.

one of these engines was exhibited at the Paris Exposition of 1855. This same principle was embodied in an engine patented by the famous engineer Sir William Siemens, in 1860, but he neglected to put it into practical use. The Siemens engine employed four cylinders, each

hot at one end and cold at the other, all connected to one shaft, and so arranged that the hot end of one communicated through a regenerator with the cold end of the next. The heat was supplied by hot products of combustion from producer gas in a chamber connected with the hot ends of the cylinders, while the opposite ends were fitted with refrigerating devices. One of the latest forms of compression engines is the Rider, shown by Fig. 4. In this sectional view *C* is the cold cylinder or compression cylinder, surrounded by the water-jacket, *E*, and *D* is the hot cylinder. The compressed air from the cold cylinder is changed through the regenerator, *H*, to the hot cylinder, where it is expanded by the heat from the grate underneath the cylinder.

FIG. 5. HOT-AIR PRODUCT OF COMBUSTION ENGINE.

Hot-air engines employing internal combustion, like compression engines, form a separate class of this type of motor. At the outset of their consideration, however, it is important to note a somewhat arbitrary distinction between them and the internal combustion motors known as gas-engines. The true gas-engine is limited generally to internal-combustion engines, in which the air, mixed with gas or with oil-vapor, is admitted to the cylinder and ignited after its admission. Liquid or gaseous fuels are essential in this type of engine. Hot-air internal-combustion engines, or, more properly, hot-air products of combustion engines, operate by forcing atmospheric air through a closed fire, which may be and generally is a solid fuel fire, and carrying the air and gases of combustion to the engine cylinder. One form of such air-engines is shown by Fig. 5. The furnace was placed in a chamber strong enough to withstand the pressure. The compressing pump *B* forced air below the ash-pit up through the fire, where it was expanded by heat and by combustion with carbon. Being admitted to the working cylinder against the piston, it was exhausted into the chimney. The furnace had to be charged with fresh fuel through a combination of double doors, *D*, working on the principle of an air-lock. A hot-air product of combustion engine was described by Sir George Cayley, an Englishman, in 1807 and 1825, and again in 1837 this inventor patented a modification of the same design and built several engines, none of which gave any marked success. In 1821 Dr. Neill Arnott (q.v.), the celebrated scientist, took up the same idea and patented a form of engine in which, to avoid the abrading action of

the ashes on metal pistons and cylinders, he used oil pistons. Following Cayley and Arnott, a number of inventors worked on the idea, among them being the Americans Stephen Wilcox, S. H. Roper, and Philander Shaw, each of whom built and sold a number of engines. Broadly speaking, the difficulties of operating these engines were so great that they recorded a general failure. These difficulties were caused by flue-dust and the grit in the cylinders, the rapid destruction of the working surfaces and valves by the intense heat, and the practical impossibility of lubrication. They were also more bulky than other types of hot-air engines in proportion to the power developed.

The possibilities of the hot-air engine as a competitor of the steam-engine are often urged, but so far it has never reached any practical success which warranted much hope that the competition would prove serious. The two sides of the question are fairly and concisely summarized by Prof. F. R. Hutton as follows:

"The hot-air engine in small sizes is more economical than the steam-engine of the same capacity. In larger sizes it has about the same economy as the less economical steam-engine, measured in coal consumed per horse-power. It has the advantage of avoiding the steam-boiler as a magazine or reservoir of energy which may be liberated by accident so suddenly as to be explosive. It can be run by less skilled and expensive labor, and no steam-runner's license is demanded. It is safe and odorless. The objections to the hot-air engine are the greater bulk and greater weight for the same power than is required with the steam-engine; the low mean pressure with high initial pressure, which latter compels great strength of structure; the deterioration of heating surfaces exposed to high heats and consequent oxidation; the difficulties of packing and lubricating at high temperatures; the difficulty of regulation closely to varying resistances. If there is any danger to the present supremacy of the steam-engine, it will be in relatively small plants that a hot-air engine can be a substitute; the gas or internal-combustion engine is more to be feared than the hot-air engine proper."

A theoretical and practical discussion of hot-air engines and heat-engines generally is contained in Hutton, *Heat and Heat-Engines* (New York, 1899).

CALORIMETRY (from Lat. *calor*, heat + Gk. *μετρον*, *metron*, measure). The science of the measurement of quantities of energy when manifested by heat effects. By the name 'heat effects' is meant the changes produced in material bodies when they are exposed to what is called a 'source of heat,' e.g. a flame or the rays of the sun. Among these changes which may take place are expansion, fusion, evaporation, alteration in electrical and magnetic properties, etc. It is now believed that these changes are occasioned by increase in the energy of the smallest portions of the bodies. When a body is 'heated' or 'warmed,' we mean that its minute parts gain energy; and opposite changes, e.g. freezing, condensation, cooling, etc., take place when these parts lose energy. It is the province of calorimetry to measure these amounts of energy gained or lost.

The *erg* (see MECHANICAL UNITS) is the unit of energy and work, and therefore all quantities of energy should be measured in terms of it; but

it rarely happens that heat effects are due directly to mechanical work except in case of friction. Consequently the *erg* is not a convenient unit. Heat effects and the energy required to produce them are almost invariably compared with one definite heat effect, viz. rise in temperature of water; and the practical unit employed for measuring thermal energy may be defined as the quantity of energy required to raise the temperature of one gram of water from 15° to 16° C. on the thermometric scale of the constant-pressure hydrogen thermometer. (Other definitions of a practical unit have been proposed, e.g. by the substitution of 20° to 21° in place of 15° to 16° C.; or the one-hundredth portion of the quantity of energy required to raise the temperature of one gram of water from the freezing-point to the boiling-point under normal pressure.) This practical unit is called the *calorie*, and its value is very nearly 4.187 joules, or 4.187×10^7 ergs. See HEAT.

By the 'specific heat' of a substance at a given temperature and under definite conditions is meant the number of calories required to raise the temperature of one gram of the substance one degree by the hydrogen scale (see THERMOMETER), at that temperature, and under those conditions. By the 'latent heat' of a substance for a definite change of state (e.g. fusion, evaporation, sublimation, dissociation), under definite conditions, is meant the number of calories required to produce the particular change of state in one gram of the substance under the specified conditions. Thus we speak of the 'specific heat of air at constant pressure,' or the 'latent heat of evaporation of water at normal atmospheric pressure.' In general, however, we can learn simply the *average specific heat*, i.e. the number of calories required to raise the temperature of one gram through t degrees, divided by t . Calorimetry is, then, chiefly, the science of measuring specific and latent heats.

There are two general methods for the measurement of specific heats, which may be regarded as satisfactory—the method of mixtures and the use of an ice or a steam calorimeter. In the method of mixtures a known quantity of the substance at a known temperature is mixed with a known quantity of some liquid at a different known temperature and the temperature of the mixture is observed. The specific heat of the liquid for the given range of temperature being known, and allowance being made for losses by radiation and conduction, and for the calories spent in changing the temperature of the vessel containing the liquid, the specific heat of the substance may be at once deduced. The most improved form of apparatus for use in this method is that of Prof. T. A. Waterman, a full description of which is given in the *Physical Review*, Vol. IV., p. 161 (1896).

In the ice-calorimeter, the substance whose specific heat is desired is introduced into an apparatus which allows the heat energy withdrawn from the body to be spent entirely in melting ice. The change in temperature of the substance and the quantity of ice melted may be observed; and thus, assuming that the latent heat of ice is known, the specific heat of the substance may be calculated. This method is due to Black; and the most improved apparatus is that designed by the late Professor Bunsen, of Heidelberg. The most accurate method of using

the 'Bunsen calorimeter' is that of Dr. Dieterici, of Hanover. (See *Wiedemann's Annalen der Physik und der Chemie*, Vol. XXXVII., p. 494, 1889.) Fairly satisfactory descriptions are given in almost all general text-books on physics. In the 'steam-calorimeter' the substance whose specific heat is desired is suspended on one pan of a chemical balance, which is inclosed in a box connected with a steam-boiler; if the steam is suddenly admitted, some of it will continue to condense on the pan and the substance until their temperature is raised to that of the steam. The quantity of steam thus condensed may be weighed by placing weights in the other pan of the balance, and, if the latent heat of condensation of steam is known, the specific heat may easily be calculated. This method is due to Professor Joly, of Dublin, and a full description of the latest improvements may be found in the *Philosophical Transactions of the Royal Society of London* (1894). In all these methods it should be noted that what is measured is the average specific heat of the substance over a given range of temperature. For other methods of measurement of specific heat, reference may be made to the larger treatises on physics.

To measure the latent heat of fusion two methods have been used successfully; one is an obvious application of the method of mixtures; the other is to secure the fusion by means of the heating action of an electric current, whose intensity and electromotive force may be measured, thus giving the quantity of energy consumed in producing the fusion.

To measure the latent heat of evaporation, two similar methods have been used, and a third also. If the vapor is conducted through a long spiral tube surrounded by water, the vapor will condense, the temperature of the water will be raised, and thus we have simply the method of mixtures. Or a liquid may be made to evaporate by means of a reduced pressure, and the consequent fall of temperature may be balanced by the heating action of a known electric current. Again, if a liquid inclosed in a Bunsen calorimeter is caused to evaporate, the surrounding water will be frozen—just the reverse of the general use of the apparatus—and the quantity frozen may be measured. For full description of these various methods for measuring latent heats of all kinds, reference should be made to general treatises on heat. Preston, *Theory of Heat* (London, 1894), is perhaps the best book of reference.

Another class of calorimeters is designed to enable the observer to ascertain the number of calories furnished when certain fuels, such as coals, oils, etc., are allowed to burn under definite conditions. In these the coal is placed in a hollow steel cylinder which can be tightly closed, oxygen is admitted under high pressure, and combustion is started by means of an electric current through a fuse wire. The cylinder is kept immersed in water, the rise of temperature of which is observed, and the energy generated thus measured. Calorimeters constructed on a large scale are used to measure the amount of heat given off by an animal or human being, the amount of food and air supplied to the subject of the test being recorded. Prof. W. O. Atwater, of Wesleyan University, has carried on a number of experiments with such an instrument, and has ascertained the fuel value of various foods. His results are to be found in a series of bulletins issued by the United States Department of Agriculture.

tins issued by the United States Department of Agriculture.

CALOTTISTES, ka'lô'tést' (Fr. *Calottiste*, from *calotte*, dimin. of OF. *cale*, cap.) A society of wits and satirists in the time of Louis XIV. and Louis XV., known as the *Régiment de la Calotte*. They were headed by two officers in the King's bodyguard, named Torsac and Aymond. Their amusement consisted in sending to any public character who had exposed himself to ridicule a 'patent' authorizing him to wear the *calotte* as a covering for the weak part of his head. The armorial bearings of the *Régiment de la Calotte* consisted of various symbols of folly, with the mottoes *C'est regner que de savoir rire*, and *Facet Momus, Luna Influit*. When Torsac, its first 'generalissimo,' died, the society, which occupied a position of satirical hostility to the French Academy, drew up a burlesque funeral oration, manufactured out of the pompously eulogistic phrases which the academicians were in the habit of using. As the society became more audacious and did not spare even royalty itself, it was dissolved by the Minister, Fleury. The *Mémoires pour servir à l'histoire de la Calotte* (Basel, 1725) is an amusing little book. During the Bourbon Restoration the title *Régime de la Calotte* was applied to the priestly administration of affairs.

CALOTYPE (Gk. *καλός*, *kalos*, beautiful, + *τύπος*, *typos*, impression). A name applied to one of the earliest processes for producing photographic prints, as well as to the prints themselves. The process was invented by Henry Fox Talbot in 1840. It consists of the following operations. A sheet of good plain paper with a smooth surface and a close and even texture, is washed by means of a soft brush with a solution of 100 grains of crystallized silver nitrate in 6 ounces of distilled water. The paper is allowed to dry in a dark room and is then dipped into a solution of potassium iodide made by dissolving 500 grains of that salt in a pint of water. After a few minutes it is removed and then dipped into water and dried. This 'iodized paper' is exceedingly sensitive to light, and may be kept for some time if it is carefully protected from sunlight. When required for use, a sheet of it is washed in a mixture which Mr. Talbot called gallo-nitrate of silver. The mixture is obtained by adding a saturated solution of gallic acid to an equal volume of a solution of 100 grains of crystallized silver nitrate in 2 ounces of distilled water, to which one-sixth of its volume of strong acetic acid had been added. After the iodized paper has been washed over with this solution it is dipped into water and then cautiously dried with blotting-paper. An exposure of less than a second in diffused daylight is sufficient to obtain an impression. In order to develop the impression the paper is again washed with gallo-nitrate of silver and dried near a fire, the exposed portions becoming brown, while the covered portions retain their original color. The picture is then fixed by consecutively washing it in clean water, drying, washing in a solution of potassium bromide (100 grains in 8 ounces of water), washing in water to remove any surplus iodide solution, and finally drying.

The calotype process has been superseded by other processes, and is at present hardly ever used. See PHOTOGRAPHY.

CALOVIUS, ABRAHAM (1612-86). A German Lutheran theologian, whose real name was Kalau, born in Mohrunge, East Prussia. He became rector of the gymnasium in Danzig (1643) and later professor of theology in Wittenberg (1650). He was a strong polemical writer; his chief works were *Systema Locorum Theologicorum* (12 vols., 1665-77), and *Biblia Illustrata* (4 vols.).

CALPE, kál'pé. One of the pillars of Hercules, now the Rock of Gibraltar.

CALPEE, or **KALPI**, kál'pé. A city in the Jalaun district of the Northwest Provinces of British India, on the right bank of the Jumna, in latitude 26° 7' N. and longitude 79° 48' E. (Map: India, C 3). Population, 12,700. It is an entrepôt for the rice and cotton of the neighboring district, and has manufactures of cotton, paper, and sugar. It is 51 miles southwest of Cawnpore, and is closely linked with it in the history of the insurrection of 1857-58.

CALPURNIA. A character in Shakespeare's *Julius Cæsar*. The rôle is drawn after the historic daughter of Calpurnius Piso Cæsoninus, and last wife of Julius Cæsar. In the play she receives portents of the impending tragedy and tries to dissuade Cæsar from going to the Senate house.

CALPURNIA GENS. See **CALPURNIUS**.

CALPURNIUS. The Calpurnia gens was, by its own account, one of the oldest plebeian clans in Rome; but it does not figure in history till the time of the First Punic War. The family names, in the time of the Republic, were Bestia, Bibulus, Flamma, and Piso.—**MARCUS CALPURNIUS BIBULUS** is known as the hostile and incapable colleague of Cæsar (B.C. 59) in the consulate. He was put up by the aristocratic party, who spent vast sums to carry the election. He finally joined the Pompeian party, had command of the fleet intended to prevent Cæsar's passage to Greece, and died B.C. 48, before the battle of Dyrrhachium. Among the Roman women of this family, two are celebrated—**CALPURNIA**, the daughter of Calpurnius Piso (consul B.C. 58), and the last wife of Cæsar, who seems, from the scanty notices of her we possess, to have been a quiet domestic woman, full of love and solicitude for her great husband; and **CALPURNIA**, the daughter of L. Calpurnius Bestia, wife of P. Antistius, who killed herself when her husband was murdered by order of the younger Marius, B.C. 82.

CALPURNIUS, **TITUS**, surnamed **SICULUS**. A little-known pastoral poet of the reign of Nero (A.D. 54-68). He was the author of seven eclogues in close imitation of Vergil, but exaggerated and artificial. These have been edited by Schenkl (Leipzig, 1885) and Keene (London, 1887), and translated by Scott (London, 1890).

CALTAGIRONE, kál'tá-jé-róná (from Ar. *Kalat-al-Girche*, fortress of Girche, a Saracen general, who captured the place in the Eighth Century). A city of Sicily, 57 miles southwest of Catania. It stands 2000 feet above the sea, on two steep hills that are connected by a bridge, has a magnificent prospect over fruitful fields in every direction, and is reputed the best built town in Sicily, having wide, well-paved streets. A stone stairway with 155 steps dating from 1506 leads from the spacious market-place up to the castle. The chief manufactures are those of

terra-cotta figures, particularly of Sicilians and Calabrians in national costumes. Mosaics and vases, disclosed by excavating, point to an ancient town of unknown origin. Population (commune), in 1881, 32,000; in 1901, 44,879.

CAITANISSETTA, kál'tá-né-sét'tá Ar. (*Kal-at-al-Nisa*, fortress of Nisa; Nisa was a Sicilian town). An episcopal city in the centre of Sicily, capital of the Province of Caltanissetta, situated on a hill 1930 feet above the sea, near the Salso, about 80 miles west of Catania, and southeast of Palermo (Map: Italy, J 10). The town has a castle, a cathedral with paintings of the later Sicilian school, public gardens with a picturesque prospect over mountain and valley, a seminary and a gymnasium, a school of technology and a school of mines, and a theatre. Two miles to the east is a beautiful Norman monastery erected in 1153 by Roger II., and 2 miles farther are a mud volcano resembling the Maccaluba (q.v., under ARAGONA) and an oil-well. The country has rich sulphur-mines, mineral springs, a lake full of fish, fields that fatten cattle and produce grain in abundance, and woods that contain much game. Population, in 1881 (commune), 30,000; in 1901, 43,300.

CALTHA. See **MARSH-MARIGOLD**.

CALTON (kál'ton) **HILL**. An elevation in the northeastern part of Edinburgh, overlooking the Forth. Three monuments surmount it, one in memory of Dugald Stewart, another in memory of Nelson, and a third in celebration of the battle of Waterloo.

CALUM'BA, or **COLOM'BA** (Neo-Lat., probably from Mozambique *Kalumb*; according to some, the name is derived from Colombo, in Ceylon). The root of *Jateorrhiza palmata*, a herbaceous plant of the natural order Menispermaceæ. The calumba now chiefly in use is produced in Mozambique. The flowers of the plant have 12 sepals and petals in all, similar in appearance, and disposed in four rows. The male and female flowers are on separate plants. The leaves are nearly circular, with five to seven lobes, on long hairy footstalks, and solitary axillary racemes of small green flowers, the racemes of the male plants branching. The fruit is a drupe, or one-seeded berry-like fruit, about the size of a hazelnut, densely clothed with long hairs. The stem is annual and twining; the root perennial, consisting of clustered, spindle-shaped, fleshy tubers, with a brown warty epidermis, internally deep-yellow, with a very bitter taste, and a faint aromatic odor. Its bitterness is ascribed to a somewhat narcotic principle called calumbine, and to berberine, an alkaloid originally discovered in the barberry. Calumba is regarded as one of the most useful stomachic tonics. As it contains no tannin, it may be taken with preparations of iron. It is well borne by the stomach, and is sometimes given to allay vomiting. It has been found useful in diarrhoea and dysentery. It is administered in the form of powder, fluid extract, or tincture. The very poisonous seed known by the name of *Cocculus Indicus* (q.v.) belongs to a plant of a different but allied genus. The root of *Frasera Walteri* is sometimes fraudulently substituted for calumba, and has been called American calumba-root. It does not agree with calumba in its properties, but besides its very different appearance, it may be distinguished by its undergoing no such change of color,

when touched with tincture of iodine, as in true calumba-root is produced by the presence of starch. See FRASERA.

CALUMET. A village in Michigan. See LAURIUM.

CALUMET (Fr., Late Lat. *calamellus*, dim. of Lat. *calamus*, reed). The popular name for the Indian ceremonial pipe. The Indians had pipes of various shapes and sizes, made of clay, stone, or bone, but the ceremonial pipe was usually of large size, in the East and Southeast of white stone, and in the West of the red catlinite from the noted pipestone-quarry in Minnesota.

CALUMET.

The stem was made long, of wood or reed ornamented with feathers and porcupine quill-work. In the East the white pipe was sometimes made with from four to seven stem-holes around the bowl, so that as many persons might smoke at the same time. Native tobacco, mixed with willow-bark or sumac-leaves, was used. Although frequently referred to as the 'peace pipe,' the ceremonial pipe was in fact used in the ratification of all solemn engagements, both of war and of peace.

CALUMPIT, kál'pōm-pēt'. A town of Luzon, Philippines, in the Province of Bulacan. It is situated on the River Pampanga and is connected by rail with Manila. Population, in 1898, 15,000.

CALVADOS, kál'vá'dós' (from Calvados, corruption of *Salvador*, the name of a vessel of the Great Armada, which was wrecked here). A northern maritime department of France, bounded north by the English Channel, and east and west and south by the departments of Eure, Manche, and Orne (Map: France, F2). It is the most historical section of the old Province of Normandy. The principal rivers are the Orne, Dromme, and Vire. The coast is partly formed by bold ridges, cliffs, and reefs. The soil of the department is generally fertile, supplying rich pasturage for cattle, sheep, and horses, which, with swine, constitute the principal wealth of Calvados. The climate is healthful, though changeable. Iron, marble, slate, and coal are found. Area, 2132 square miles. Population, in 1896, 414,669; in 1901, 407,639. Capital, Caen.

CALVAERT, kál'vært, or **CALUWAERT**, DIONYSIUS (c.1540-1619). A Flemish historical and landscape painter (called in Italy DIONISIO FIAMMINGO, 'the Fleming'). He was born in Antwerp, and was registered as an art pupil there in 1556; but he soon went to Italy and studied under Prospero Fontana, and later under Sabbatini, assisting the latter in the Vatican.

About 1574 he opened a school in Bologna, and had among his students the celebrated Domenichino, Guido Reni, and Albani. Many excellent pictures by him are still preserved in Bologna, where he died.

CALVARY. In Roman Catholic countries, a representation of the various scenes of the passion and crucifixion of our Lord, either in a chapel, or external to the church, as at Saint Jacques in Antwerp. It consists of three crosses with the figures of Christ and the thieves, usually as large as life, surrounded by a number of figures, representing the various personages who took part in the crucifixion. At Aix-la-Chapelle, the calvary is a church on the top of a hill, surrounded by twelve sculptured stones, each marking an event which took place on the journey of the Saviour to Mount Calvary. The approach to the calvary is called the *Via Dolorosa*, each of the stones marking what is called a station (see STATIONS), at which the pious say a prayer in passing.

CALVARY. An oratorio brought out at the Norwich festival in England in 1839. It was a translation of *Des Heilands letzte Stunden* (Casel, 1835) by Spohr, who personally conducted the production.

CALVÉ, kál'vá', EMMA, stage name of EMMA DE ROQUER (1864—). A French dramatic soprano. She was born in Madrid of a Spanish father and a French mother, and was brought up in a convent school in the Department of Aveyron, southern France. She studied under Rosine Laborde, and made her début in *Faust*, at the La Monnaie, Brussels (1882). Though praised, she showed no trace of her now admired fiery temperament. She overexerted her voice, and, on Gevaert's advice, went to Marchesi, reappearing (in 1884) in Dubois's *Aben Hamet* at the Théâtre des Italiens, then directed by Maurel. Since then she has sung at the Opéra Comique, at the Grand Opera, in England, Italy, Spain, Russia, and the United States, making her début in New York on November 29, 1893. She has sung in David's *Lalla Rookh*, *Nozze di Figaro* (Countess and Cherubino), *Magic Flute* (Pamina), Widor's *Maitre Ambrose*, *Pêcheurs de Perles*, *Carmen*, *Hamlet*, *Cavalleria Rusticana*, *Faust*, *Mefistofele*, *Pagliacci*, *L'Amico Fritz*. Besides, she created the leading parts in Joncières's *Chevalier Jean* (1885); Samara's *Flora Mirabilis* (1886); De Lara's *Messaline* (1900); Massenet's *Navarraise* (1895); and *Sapho* (1897), the last two written especially for her. She was ready to sing Elsa in French, when the Opéra Comique burned down (1887).

Calvé's voice is a rich soprano sfogato of 2½ octaves from *g* below the staff to a high *c*, perfectly even throughout, with a contralto-like low register. Her extraordinary dramatic powers have gained for her the title of the 'singing Duse.' Her dazzling success as *Carmen* and *Santuzza* has led many to believe that she is mediocre as a singer pure and simple, with a small répertoire; but her technical virtuosity in *Ophelia* alone would place her among the greatest singers the world has known.

CALVERLEY, kál'vēr-lī. The principal character in the pseudo-Shakespearian *Yorkshire Tragedy*. He is a dissolute fellow impoverished by gaming, whose maltreatment of his wife and

children brings about the catastrophe of the play.

CALVERLEY, CHARLES STUART (1831-84). An English humorist, born at Martley, Worcestershire. His father was the Rev. Henry Blayds, a name adopted near the first of the century, but in 1852 again changed to the ancestral Calverley. He was educated at Balliol College, Oxford, and at Christ's College, Cambridge, of which, after a brilliant career, he was appointed fellow (1858). At this time he was famous among his friends for many parodies and an examination paper on *Pickwick*. His publications are *Verses and Translations* (1862); *Translations into English and Latin* (1866); *Theocritus Translated into English Verse* (1869); and *Fly Leaves* (1872). Calverley holds a high place among writers of light and humorous verse, and his Latin renderings are exceedingly felicitous. After years of ill health, he died February 17, 1884. Consult Sendall, *Literary Remains*, with memoir (London, 1885).

CALVERT, GEORGE, and CECIL. See BALTIMORE, BARONS OF.

CALVERT, GEORGE HENRY (1803-89). An American journalist and author, born in Baltimore, Md. He graduated at Harvard in 1823, studied in Göttingen, and, on his return from Germany, was editor of the *Baltimore American* for a number of years. In 1843 he removed to Newport, R. I., of which city he was elected mayor in 1853. He published a number of works in both prose and verse, including dramas, translations, and critical essays. Among them were: *Illustrations of Phrenology* (1823), the first treatise on the subject issued in this country; *Scenes and Thoughts in Europe* (1846-52); *An Introduction to the Social Sciences* (1856); *The Gentleman* (1863); *Goethe: His Life and Work* (1872); and *Three Score, and Other Poems* (1883).

CALVERT, Sir HARRY (c.1763-1826). An English general. He was born at Hampton Court, and was educated at Harrow. In 1778 he was appointed second lieutenant of the Royal Welsh Fusiliers, and was soon ordered to America, where he participated in the siege of Charleston and in the campaign of Cornwallis which ended with the surrender at Yorktown. As adjutant of the Duke of York, he participated in the war with France which began in 1793. He became lieutenant-general in 1810, baronet in 1818, and general in 1821. His letters and memoranda were published by his son under the title, *Journals and Correspondence of Sir Harry Calvert, Bart.* (London, 1853).

CALVERT, LEONARD (c.1582-47). The first Colonial Governor of Maryland. He was the brother of Cecil Calvert, the second Lord Baltimore, and by him was placed in charge, as Governor, of the small company of 200 men, who, in 1634, settled in Maryland under the charter secured from Charles I. by George Calvert, first Lord Baltimore. He continued to act as Governor until his death, though in 1643-44 he visited England to consult with his brother about affairs in the Colony. Perhaps the most noteworthy event during his term as Governor was his contest with William Claiborne (q.v.), who had settled on Kent Island before 1634, and denied the jurisdiction of the Maryland authorities. Claiborne was driven out in 1635, but in 1644 succeeded in ex-

PELLING Calvert, who, however, again defeated him in 1646.

CALVES' HEAD CLUB. An association whose purpose was to ridicule the memory of Charles I. Its history is very obscure. According to the *Secret History of the Calves' Head Club* (2d ed., 1703), probably written by the notorious Ned Ward, it was originated by John Milton, and its meetings were given over to unseemly orgies in contempt of the Stuarts; but this book is absolutely worthless. Apparently there was no fixed place of assembly. The principal gathering is said to have taken place each year on January 30, the anniversary of the King's execution. It is highly improbable that the organization long survived the Restoration. If so, its proceedings must have been entirely secret. In 1735 a meeting of some young men calling themselves the Calves' Head Club was held at a tavern in Suffolk Street, London. An accident gave rise to a riot. As usually explained, the disturbance was caused by scandalous toasts offered within hearing of the crowd; but this is denied by Lord Middlesex, who was present. The affair has recently been pronounced a hoax, having no connection with the original association, which had doubtless long since ceased to exist. Consult: Timbs, *Clubs and Club Life in London*, new ed. (London, 1898). Compare Wilson, *Memoirs of the Life and Times of Daniel De Foe* (London, 1830); Spence, *Anecdotes*, 2d ed. (London, 1858); Walford, *Old and New London* (London, n. d.); and *Harleian Miscellany*, Vol. XII (London, 1811).

CALVI, kâl'vê. A fortified seaport of Corsica (belonging to France), situated on a peninsula in the Gulf of Calvi, about 38 miles west-south-west of Bastia. It has an old cathedral and good harbor, and carries on some trade in fish and southern fruit (Map: France, P 8). Calvi was captured by the English in 1794, after a siege of fifty-one days. Population, in 1896, 2132.

CALVILLE, Fr. pron. kâl'vel' (Fr., from Lat. *calvus*, bald, smooth surface). A kind of apple, of which there are numerous sub-varieties. The Calvilles diminish in thickness from the middle toward the calyx, where they form a point: they have regular ribs and a large open seed-chamber; also a pleasant smell, and are oily to the touch. They are never altogether streaked: they have a fine loose flesh, with a flavor somewhat resembling that of the raspberry or strawberry. The white winter Calville is in high repute, both as a culinary and dessert apple; it is very extensively cultivated on the Continent of Europe. This class of apples was early introduced in America, but is not now listed in the catalogues.

CALVIN (in its French form *Caucin*, or *Caulvin*), JOHN (1509-64). One of the most eminent of the Reformers of the Sixteenth Century. He was born at Noyon, in Picardy, France, July 10, 1509. His father, Gérard Cauvin, was procureur-fiscal of the district of Noyon, and secretary of the diocese. His mother was Jeanne Lefranc. He was one of six children—four sons and two daughters. All the three sons who survived were bred ecclesiastics; and the Reformer himself, on May 29, 1521, while still only 12 years of age, was appointed to receive part of the revenue of a chapel in the

cathedral church of Noyon. This he held as a means of support during the period of his education, and even for some short time after he had entered upon his reforming career. Calvin was educated in circumstances of ease, and even of affluence. The noble family of Montmor, in the neighborhood, invited him to share in the studies of their children; he was in some measure adopted by them, and when the family went to Paris, in his fourteenth year (1523), he accompanied them, and participated in the benefits of the higher instruction which was there attainable. He was entered as a pupil in the Collège de la Marche, under the regency of Mathurin Cordier, better remembered, perhaps, by his Latin name of Corderius. It was under this distinguished master that Calvin laid the foundation of his own wonderful mastery of the Latin language. Not long afterward he left him for the strictly ecclesiastical college of Montaigu, in the same university. During this early period he was distinguished by the great activity of his mental powers and the grave severity of his manners. His companions, it is said, surnamed him the 'Accusative.'

Probably at first his father intended that he should study theology, and in 1527 got him the curacy of Saint Martin de Martheville (near Vermans, Aisne) in addition to that of the chapel, which, however, Calvin resigned in 1529, in favor of his younger brother, and the same year exchanged the curacy for another, that of Pont l'Évêque, where his father had been born. But in 1528 his father changed his mind and determined that he should become a lawyer. He therefore sent him, with the view to his studying law, to the University of Orleans, then adorned by Pierre de l'Etoile, one of the most famous jurists of his day, and afterwards president of the Parliament of Paris. At Orleans he continued the same life of rigorous temperance and earnest studiousness for which he was already noted. Beza says that, after supping moderately, he would spend half the night in study, and devote the morning to meditation on what he had acquired. His undue habits of study seem to have laid thus early the foundation of the ill health which marked his later years. It was while a law-student in Orleans that he became acquainted with the Scriptures and received his first impulse to the theological studies which have made his name so distinguished. A relative of his, Pierre Robert Olivetan, was there engaged in a translation of the Scriptures; and this had the effect of attracting Calvin's attention, and awakening within him the religious instinct which was soon to prove the master-principle of his life. We cannot say as yet that his traditional opinions were unsettled or that he had embraced with any decision the Protestant opinions that were spreading everywhere; but the seeds of the new faith were now beyond doubt sown in his heart, and from this time, although he still continued for a while longer to pursue his legal studies, his main interests appear to have been religious and theological. From Orleans he went to Bourges (1530), where he acquired a knowledge of Greek, under the tuition of a learned German, Melchior Wolmar, whose spiritual instructions influenced him. He began here to preach the reformed doctrines, and passed into the ranks of Protestantism, under

the slow but sure growth of his new convictions, rather than under the agitation of any violent feeling. Here, as everywhere, his life presents a marked contrast to that of Luther.

The death of his father in 1531 left him free to follow his inclinations, which were for theological and classical studies. He proceeded to Paris, which at this date had become a centre of the 'new learning,' under the teaching of Lefevre and Farel, and the influence of the Queen of Navarre, sister of Francis I., and there he published, at his own expense, in 1532, his first book, a commentary on Seneca's essay *On Mercy*. But reformed notions in theology were in the air. The Sorbonne itself had not escaped the infection. There was a growing religious excitement in the university, in the Court, and even among the bishops. This, however, was not to last. The King was soon stirred up to take active measures to quell this rising spirit. Calvin was himself converted to the new views, and when his friend, Nicholas Cop, had been elected to the rectorship of the University of Paris, he wrote the inaugural oration (1533) for him and took for his theme the necessity of there being a reformation of the Church and of theology on the basis of the New Testament. The result was that Calvin and Cop were obliged to flee for their lives. The story is that Calvin narrowly escaped, having descended from his window by means of his sheets, and fled, under the guise of a vine-dresser, a friend of his, in whose clothes he concealed himself. After this he repaired for a short time to his native place, resigned the preferment he held in the Roman Catholic Church, and for nearly three years led a wandering life, sheltered in various places. We find him at Saintonge; at Nérac, the residence of the Queen of Navarre; at Angoulême, with his friend, Louis Tillet; then for a brief period, while in Paris again, strangely enough expecting a meeting with Servetus, who had expressed a desire to see and confer with him. Persecution against the Protestants at this time raged so hotly that Calvin was no longer safe in France; and he betook himself to Basel, where he prepared the first edition of the *Institutes of the Christian Religion* (1536), with the famous preface addressed to Francis I. The concentrated vigor of this address, its intensity of feeling, rising to indignant remonstrance, and at times to a pathetic and powerful eloquence, make it one of the most memorable documents in connection with the Reformation. It is throughout a noble defense of the righteous character of the reformed doctrines, and their support alike in Scripture and in history. The energetic decisiveness and moral zeal of the future teacher and legislator of Geneva speak in every page of it. After completing this great service to the cause of Protestantism, he went for a short time to Italy, to visit Renée, the Duchess of Ferrara. Finally, he revisited his native town, sold the paternal estate, which had devolved to him on the death of his eldest brother, and, bidding it adieu, set out, in company with his younger brother and sister, on his way to Strassburg. The direct road being rendered dangerous by the armies of Charles V., which had penetrated into France, he sought a circuitous route through Savoy and Geneva.

The result of this journey was memorable for the cause of the Reformation. Arrived in Geneva

(July, 1536), he met there his friend, Louis du Tillet, who communicated the fact of his arrival to Farel, then in the very midst of his struggle to promote the Reformation in the city and neighborhood. Farel hastened to see him and urged upon him the duty of remaining where he was, and undertaking his share of the work of God, under the burden of which he himself was likely to sink. Calvin did not at first respond to the call. He was given, he himself says, to his "own thoughts and private studies." He wished to devote himself to the service of the reformed churches generally rather than to the care of any particular church. A life of intellectual and theological labor was that which at that time was most congenial to him. By some strange insight, however, Farel discerned the higher fitness of the young stranger who stood before him, and he ventured, in the spirit of that daring enthusiasm which characterized him, to lay the curse of God upon him and his studies if he refused his aid to the Church of Geneva in her time of need. This seemed to Calvin a divine menace. "It was," he said, "as if God had seized me by His awful hand from heaven." He yielded and joined eagerly with Farel in the work of reformation.

Such was the beginning of Calvin's great career in Geneva. Having abandoned his intention of pursuing his journey, he soon infused an energy into his task which crowned the struggling efforts of Farel with success. The hierarchical authority was already overturned before his arrival; the citizens had asserted their independence as against the Duke of Savoy, whose alliance with the corrupt episcopate, which was the direct governing influence in the place, had called forth the patriotic as well as the religious feelings of the people. The magistrates and people eagerly joined with the reformers in the first heat of their freedom and zeal. A Protestant confession of faith was drawn up, approved of by the Council of Two Hundred, the largest governing board of the city, and then proclaimed in the cathedral church of St. Peter's as binding upon the whole body of the citizens. Great and marvelous changes were wrought in a short time upon the manners of the people; where license and frivolity had reigned, a strict moral severity began to characterize the whole aspect of society. The change, however, was too sudden and the strain was too extreme. A spirit of rebellion against the rule of Calvin and Farel broke forth. They, however, refused to yield to the wishes of a party animated by a more easy and liberal spirit than themselves (known in the history of Geneva under the nickname of Libertines); and the consequence was that they were both expelled from the city after less than two years' residence (April 23, 1538).

Calvin turned to Strassburg, where he had meant to go when arrested in his course in Geneva. Here he settled, and devoted himself to theological study, and especially to his critical labors on the New Testament. Here, also, in October, 1539, he married a member of his congregation, Idelette de Bure, widow of Jean Stordem, of Liège, an Anabaptist, whom he had converted, and who had died in February, 1538. The marriage appears to have proved a happy one. His wife bore him one child, a son, who, being born prematurely, died shortly after his birth.

(See his letters to Viret of July and August 19, 1542.) She herself died in April, 1549.

The Genevans found, after a short time, that they could not well do without Calvin. His rule might be rigid; but an authority even such as his, which might prove galling in its severity, was better than no settled authority at all; and the Libertine party seemed to have been unable to construct any efficient and beneficent form of government. Accordingly, the citizens invited Calvin to return; and after some delay on his part, in order to test the spirit in which they were acting, he acceded to their invitation, and on September 13, 1541, after three years' absence, once more made his entry into Geneva.

Now, at last, he succeeded in establishing his plan of Church government, in all its form and details. By his college of pastors and doctors, and his consistorial court of discipline, he founded a theocracy, with himself at the head of it, which aimed virtually to direct all the affairs of the city, and to control and modify both the social and individual actions of the citizens. Not without a struggle, it may be supposed, did he succeed in his great autocratic scheme. The Libertines, although dishonored by their ineffectual attempts to maintain order in the city, and uphold its rights and dignity, still remained a strong party, which was even augmented after Calvin's return by such men as Amy Perrin, who had strongly concurred in the invitation to Calvin, but who were afterwards alienated from him by the arbitrary way in which he pursued his designs, no less than by their own schemes of ambition. The struggle with these opponents lasted with varying fortunes for no less a period than fifteen years, and was only terminated in 1556, after a somewhat ridiculous *émeute* in the streets. Amy Perrin and others, driven from the city, were executed in effigy; and the reformer's authority from this date strengthened into an absolute supremacy.

During the period of this long struggle with the Libertines, Calvin had many other disputes, in which he displayed equal zeal. The most remarkable of these were his controversies with Sebastian Castellio, Jerome Bolsec, and, above all, Michael Servetus.

Calvin had become acquainted with Castellio in Strassburg (1540). They entertained at first a warm friendship for each other, and Calvin showed great zeal in assisting Castellio, whose poverty and learning had attracted his sympathy. When he returned to Geneva, he invited Castellio to join him there, and procured for him the rectorship in the Latin school of the city. There was little similarity, however, in the characters of the two men, and the diversity of their tastes and views soon became apparent. The learning of Castellio was intensely humanistic; a classical spirit and a somewhat arbitrary opinionativeness molded all his studies. As soon as he began to apply himself to theology, he came into conflict with Calvin. In a letter to Viret, September 11, we find Calvin speaking of "the freaks of our friend Sebastian, which may both raise your bile and your laughter at the same time." These freaks relate to Castellio's notions of scriptural translation, and his refusal of Calvin's offer to revise the version which he had made of certain parts of Scripture. Then, two years later, when Castellio desired to en-

ter the ministry, Calvin dissuaded the council from accepting him, on account of some peculiar opinions which he held. These were certain rationalistic views as to the authenticity and character of the Song of Solomon, the descent of Christ into hell, and also about election. After this, Castellio left Geneva for a while, but soon returning, he attacked the views of Calvin openly (see Calvin's letter to Farel, May 30, 1544), and was forced to leave the city. The two old friends, now declared enemies, did not spare each other henceforth. Castellio died in Basel December 29, 1563. (For his biography, consult F. Buisson, Paris, 1892.) The fate of Servetus drew forth an anonymous publication, attacking with keen logic and covert and ingenious sarcasm the Genevan doctrines. This publication was attributed by both Calvin and Beza to Castellio, and they replied to him in no measured terms, stigmatizing him as a "deceiver and vessel of Satan." One fact really disgraceful to Calvin in the controversy ought not to be passed over. Sunk in great poverty, Castellio was obliged, in his old age, to gather sticks on the banks of the Rhine at Basel, as a means of support. Calvin did not hesitate to accuse him of stealing the sticks. Such polemical truculence may well make us turn away in disgust and indignation.

The controversy with Bolsec belongs to a later period. Jerome Bolsec was originally a Carmelite monk, but had thrown aside the habit, and betaken himself to the practice of medicine in Geneva. He was led to attack Calvin's doctrine of predestination. As soon as Calvin heard of this, he gave him to understand that he was not at liberty to question the Genevan doctrine. He and others of the clergy dealt with him; but after repeated disputations, Bolsec was found incorrigible, and was sentenced to banishment from the city (December 25, 1551). Cast out of the theocratic community, he ultimately rejoined the Roman Catholic Church, and meanly revenged himself upon Calvin by writing his life in a spirit of detraction and slander (Lyons, 1577).

Of all these contests, however, the most memorable is that with Servetus. A melancholy interest surrounds the name of this great heretic, which the criminal tragedy of his death keeps ever fresh and vivid in the minds of all who hate intolerance, and who love truth more than dogmatism. The character of Servetus himself has little to do with this interest. He seems to have been a vain, restless, and enthusiastic dreamer, rather than a calm and patient inquirer. In his very dreams, however, and the vague audacities of his speculation, there is a kind of simplicity and unconscious earnestness that wins sympathy. He had entered into various relations with Calvin even from the time of his early residence in Paris; particularly, he had sent him various documents containing the views fully developed, in his work subsequently published under the title of *Restitutio Christianismi* (1553). Calvin never concealed his abhorrence of these views; and in a letter to Farel on February 13, 1546, he says: "Servetus lately wrote to me. . . . He takes it upon him to come hither, if it be agreeable to me, but I am unwilling to pledge my word for his safety, for if he shall come, I shall never permit him to depart alive, provided my authority be

of any avail." The history of his seizure and condemnation at Vienne by the Catholic authorities, and especially of Calvin's share in the correspondence which led to his seizure, is very complicated and obscure. It has been maintained that Calvin was the instigator, through a creature of his own, of the name of Trie, of the whole transaction; it is certain that he forwarded to the authorities, through Trie, private documents which Servetus had intrusted to him, with a view to the heretic's identification, and as materials for his condemnation. Servetus was sentenced to be burned, but effected his escape, and, after several months' wandering, he was found in Geneva. It was his intention to proceed to Italy, where he hoped his opinions might meet with some degree of toleration, and he arrived at Geneva on his way. This is the explanation of an event otherwise unaccountable. Having ventured to attend church, according to the common account, he was recognized, apprehended, and conveyed to prison by Calvin's order, just as he was about to leave the city. The particulars of his trial are full of interest, but too detailed to be given here. It lasted, with various interruptions, for two months. He attacked Calvin with the most foul epithets, and Calvin retorted with a virulence and foulness quite equal to his own. At length, on October 26, 1553, sentence was passed upon Servetus, condemning him to death by fire. Calvin used his influence to have the mode of death altered to decapitation, but without success. On the very next morning the sentence was put into execution. On an eminence, at some distance from the city, Servetus was fastened to a stake, surrounded by heaps of oak-wood and leaves, with his condemned book and the MS. he had sent to Calvin attached to his girdle; and, amid his agonizing cries, the fire was kindled, and the wretched man expiated his heresy in the flames. Whatever apologies may be urged for this memorable crime, it must remain a mournful and scandalous blot on the history of the Reformation. The disgrace of it has particularly attached to Calvin, and with much justice, from the special and unhappy relation which he bore to the whole transaction; but many of the other reformers are no less implicated in it. The wise Bullinger defended it, and even the gentle Melancthon could see only cause for gratitude in the hideous tragedy. See SERVETUS.

After the execution of Servetus, and the expulsion of the Libertines, two years later, Calvin's power in Geneva was firmly established, and he used it vigorously and beneficently for the defense of Protestantism throughout Europe. By the mediation of Beza, he made his influence felt in France in the great struggle there going on between the hierarchical party, with the Guises at its head, and the Protestants, led by Condé and Coligny. In 1561 his energies began to fail. He had long been suffering from bad health, but his strength of will and buoyancy of intellect sustained him amid all his bodily weakness. In the year now mentioned, his bad health greatly increased, and although he survived for more than two years, he never regained his vigor. He died in Geneva on May 27, 1564.

Very different estimates, it may be imagined, have been formed of Calvin's character, according to the point of view from which it is con-

templated. None, however, can dispute his intellectual greatness, or the powerful services which he rendered to the cause of Protestantism. Stern in spirit and unyielding in will, he is never selfish or petty in his motives. Nowhere amiable, he is everywhere strong. Arbitrary and cruel when it suits him, he is yet heroic in his aims, and beneficent in the scope of his ambition. Earnest from the first, looking upon life as a serious reality, his moral purpose is always clear and definite—to live a life of duty, to shape circumstances to such divine ends as he apprehended, and, in whatever sphere he might be placed, to work out the glory of God.

He rendered a double service to Protestantism, which, apart from anything else, would have made his name illustrious; he systematized its doctrine and he organized its ecclesiastical discipline. He was at once the great theologian of the Reformation, and the founder of a new Church polity, which did more than all other influences together to consolidate the scattered forces of the Reformation and give them an enduring strength. As a religious teacher, as a social legislator, and as a writer, especially of the French language, then in process of formation, his fame is second to none in his age, and must always conspicuously adorn the history of civilization. Among Calvin's most important works are: *Christianæ Religionis Institutio* (1536); *De Necessitate Reformandæ Ecclesiæ* (1544); *Commentaires sur la concordance ou harmonie des Evangélistes* (1561); *In Novum Testamentum Commentarii*; *In Libros Psalmorum Commentarii*. The first edition of Calvin's whole works is that of Amsterdam, 1671, in 9 vols., fol., but this has been superseded by the definitive and critical edition begun by J. W. Baum, E. Cunitz, and E. Reuss, and finished by Lobstein and Erichson (59 vols., Brunswick and Berlin, 1863-1900). Consult A. Erichson, *Bibliographica Calviniana* (Berlin, 1900). By the Calvin Translation Society, in Edinburgh, his works have been collected, translated into English, and issued in 51 vols., 1843-55. For his biography, consult: T. de Beza (Geneva, 1564; n.e. Paris, 1869), the original life, written a few weeks after Calvin's death; J. Bolsec (Lyons, 1577; n.e. 1875); and J. M. V. Audin (Paris, 1841; 6th ed. 1873), written from the Roman Catholic standpoint; P. Henry (3 vols., Hamburg, 1835-44), English translation abridged and altered by Stebbing (London, 1851); T. H. Dyer (London, 1850); F. Bungener (Paris, 1863, English translation Edinburgh, 1863); E. Staehelin (Elberfeld, 1863); A. Pierson (Amsterdam, 1883-91)—all of which are written from the Protestant point of view. A very valuable and impartial book from a Roman Catholic is, F. W. Kampschulte, *Johann Calvin, seine Kirche und sein Staat in Genf* (Leipzig, 1869-90). An exhaustive work is that of E. Doumergue, of which the first volume appeared in Lausanne in 1899. It contains many illustrations from original drawings, facsimiles, etc., and is the work of a lifetime. Consult also the biography of Calvin by Philip Schaff in his *History of the Christian Church* (New York, 1892), Vol. VII., pp. 257-844.

CALVINISM. The system of thought deriving its name from its greatest representative, John Calvin (1509-64). It has its starting-point

in the conception of the sovereignty of God. This is not merely His sole causality in the physical universe, but His priority, in particular, in the whole realm of the religious life. The fundamental element of the system was expressed by Schleiermacher, *Die christliche Glaube* (Sec. 32 ff.), and after him by the learned historian of the reformed theology, Schweizer, *Die Glaubenslehre der evangelisch-reformirten Kirche* (Sec. 23), as the feeling of the entire dependence of all that is and takes place upon God. This predestination, which has sometimes been seized upon as the distinguishing feature of the system, is a consequence of the true principle rather than that principle itself.

The historical origin of Calvinism goes far back of Calvin himself. It found its first prominent exponent in Augustine (q.v.), though its essential elements may be detected in the earliest history of the Church. It took its Augustinian form in consequence of the discussions of the Pelagian controversy (see PELAGIANISM), in which the point at issue was the originating source of conversion. Pelagius maintained that this was in the independent action of man, Augustine that it was in the prevenient grace of God, eliciting the human activity. From this germ developed the most distinctive features of Augustinianism, original sin, bondage of the will, and inability to be good, predestination, and the reference of all good to God alone. The tendency of the course of discussion in the Middle Ages was to weaken the Augustinian system, but it was restored by the Reformers, Luther, Zwingli, and Calvin. The latter incorporated it in his *Institutes* (final edition, 1559), which was the most perfect system of Christian doctrine that had ever been produced. From this work it went into the great Protestant confessions, the Heidelberg, French, Belgic, Synod of Dort (on occasion of the controversy with the Arminians, q.v.), and the remarkable series of English confessions, beginning with the *Articles of the Church of England* (first issued in 1552), embracing the Lambeth (1595) and the Irish (1615) articles, and concluding with the Westminster (1647). It was represented by a long series of divines, of whom Beza, Bullinger, Ames, Turretin, John Owen, Jonathan Edwards, and Charles Hodge (best recent statement of the system) may be mentioned. It is now the confessional theology of the Presbyterian and so-called 'Reformed' churches in all the Protestant nations. In New England, under the influence of Edwards and his pupils, there arose a school of 'consistent' Calvinists, who variously modified the details of the system, principally in consequence of a new psychology of the will and of virtue. But this has manifested its essential divergence from Calvinism by the further development through which it has gone.

The decisive element of the Calvinistic system is, then, its doctrine of God. With other Protestant systems, it is distinctly theistic and trinitarian. It lays emphasis upon the immutable nature of God, and upon His unchangeable attributes of justice and love, each equally sovereign. God's design in the creation of the world was the manifestation of His own glorious attributes, of which these are the chief. Accordingly, He forms in eternity the plan upon which he conducts both creation and the government

of the created world. He "foreordains whatsoever cometh to pass." Two schools have arisen as to the order of the divine decrees: one, the 'Supralapsarian,' looking to the final result as the first thing contemplated in God's decree, and making their order, therefore, creation, election, and reprobation, the fall, redemption by Christ, and application of redemption by the Holy Spirit; the other, the 'Infralapsarian,' which seeks to avoid the impression gained from Supralapsarianism, that men are condemned before they are guilty, by making the order of decrees, creation, fall, election, redemption, etc. The latter has been the prevailing view among Calvinists, though many regard the difference as merely logical.

The decree of the fall is the decree that man shall sin; but Calvinists generally regard this as a permissive decree, and all understand that man sins in perfect freedom, and that sin is his own act, and not that of God. All the decrees equally preserve the freedom of man. This theological proposition is explained by various theories of the will and of the psychology of moral action. None of these can be regarded as essential to the system, which is independent of its psychological explanation. The first sin, the sin of Adam, did not affect him alone, but involved the race in sin and guilt. Every member of the race is so connected with its first member (whether by divine constitution, by a realistic identity, or by federal representation) that all sin in and with him and are justly condemned for that sin. Thus Adam's sin is said to be 'imputed' to his descendants. Imputation is either 'mediate,' that is because of original depravity, or 'immediate,' by which original depravity is the penal result of original guilt directly imputed. Original sin, which is prenatal forfeiture of the indwelling of the Holy Spirit, with consequent defect and disorder of soul, and inclination to evil, results in actual and individual sin. The consequence of all this is a total inability to be good and the absolute necessity of regenerating grace before any soul can repent and receive the divine forgiveness. Hence the electing grace of God cannot be conditioned upon the foreseen faith of the elect, because, apart from God's activity, and thus apart from His purpose to act in their behalf, or apart from election, they have no faith and can have none.

Grace is the favor of God shown to the undeserving. It is the execution of the decrees of God. God, in forming the decree of election, is sovereign; that is, the motive which leads Him to set apart a certain and fixed number of souls unto eternal salvation resides in Himself alone, and not in them. Grace is of three kinds: 'Common' grace is bestowed upon all men, tends to good, and results in the various natural virtues, such as kindness, honesty. 'Prevenient,' 'effectual,' or 'irresistible' grace is that by which the soul is regenerated. It is sometimes said to be an activity beneath consciousness, or effected creatively, in the very nature of the soul. By it the will is moved to holy action, and repentance and faith are produced. 'Coöperative' grace works with the will thus turned to God, and is the case of what degree of actual holiness the Christian attains. Grace also includes the 'gift of

perseverance,' which secures the perseverance and final salvation of the soul.

The Calvinistic doctrine of the Atonement depends upon the positions already rehearsed. It is an act of the infinite love of God finding a way whereby both His attributes of justice and mercy may be completely and consistently exercised in the salvation of men. It provides a substitute for the sinner who, because of his humanity, can represent man, and because of His divinity, can offer a sufficient sacrifice for men's sins. The God-man bears the penalty of the sins of men as a true penal substitute, thus satisfying justice, and works out a perfect righteousness for weak and imperfect men; and thus He provides for both the forgiveness and the justification of the believer.

The adherents of Calvinism claim for it a great and decisive influence for good upon the history of the world. As the religion of the French Huguenots, of the founders of the Dutch Republic, of Scotch Covenanters, and of English Puritans, it has its heroic period to point to, and its roll of martyrs second to none. Bancroft, the historian of the United States, himself not a Calvinist, refers modern republican liberty to the influence of the little Republic of Geneva, and to Calvinism. Its influence in promoting the independence of the United States was indisputably great. It has proved one of the chief forces in promoting the education of the common people, and in fostering higher education in the modern world. And its efforts in the department of foreign missions during the last century led and surpassed those of other schools of thought.

For the essential sources in the study of Calvinism, consult: Bright, *Select Anti-Pelagian Treatises of Saint Augustine* (London, 1880, for the Latin text, or Warfield's "Augustine's Anti-Pelagian Treatises," in *Nicene and Post-Nicene Fathers*, Vol. V. (New York, 1886-88); Calvin, *Institutio Christianæ Religionis*, edited by Tholuck (Berlin, 1846); English translation, *The Institutes of the Christian Religion* (Philadelphia). Best modern presentations: Charles Hodge; *Systematic Theology* (3 vols., New York, 1872); W. G. T. Shedd, *Dogmatic Theology* (3 vols., New York, 1888). Expositions, A. A. Hodge, *A Commentary on the Westminster Confession of Faith* (Philadelphia, 1869); A. Kuyper, "Calvinism," *The Stone Lectures* (New York, 1898). See ARMINIANISM.

CALVINISTIC METHODISTS. A body in Great Britain in three divisions: the Whitefield Connection, 1741; Lady Huntingdon Connection, 1748; and Welsh Methodists, 1750. See METHODISM; PRESBYTERIANS.

CALVINISTIC (or PARTICULAR) BAPTISTS. See BAPTISTS.

CALVO, kál'vó, CARLOS (1824-93). An Argentinian diplomat and writer on international law. He was born in Buenos Ayres and early entered upon a diplomatic career abroad. He was one of the founders of the Institut de Droit International, and later the Ambassador of the Argentine Republic to France. Among his principal works are the following: *Recueil complet des traités, conventions, etc., de l'Amérique latine* (11 vols., 1862-69); *Annales historiques de la révolution de l'Amérique latine*

(5 vols., 1864-75); *Le droit international théorique et pratique* (4th ed., 1887-88); *Manuel de droit international public et privé* (3d ed., 1892).

CALVUS, GAIUS LICINIUS MACER (B.C. 82-47). A Roman poet and orator. In the latter capacity he is often praised by Cicero (*Brut.*, lxxxi, lxxxii, ss. 280-285; *Ep. ad Fam.* vii. 24; xv. 22). According to the ancients (Quint. x., s. 111; Catullus, 96; Propertius, ii. 19, 40; Ovid, *Am.*, iii. 9, 61); his poems were full of wit and grace, and were classed with those of Catullus. The latter addressed three of his odes (14, 50, 96) to Calvus.

CALYCANTHUS (from Gk. κάλυξ, *kalyx*, cup + ἄνθος, *anthos*, flower, referring to the cups enclosing the pistils). A genus of Calycanthaceæ, an order of plants allied to Rosaceæ. Only about six species are known. They are shrubs with opposite entire leaves, and are natives of North America and Japan. An aromatic fragrance characterizes the order, and in the genus Calycanthus the bark and leaves possess it as well as the flowers. The bark of the Calycanthus has acquired the name of Carolina allspice, or American allspice. The flowers are of a chocolate or dull purple color. It is quite a favorite garden shrub, being commonly known as 'sweet-scented shrub.' The four American species are found wild along the Alleghanies, in Pennsylvania, Virginia, etc., except *Calycanthus occidentalis*, with brown flowers, which grows in California only.

CALYDON (Gk. Καλυδών, *Kalydōn*). An ancient city of Ætolia, 7½ miles from the Ionian Sea on the river Evenus. It was celebrated in Greek legend as the home of Meleager, Tydeus, and other heroes, but in historic times was of small importance. In B.C. 391 it was in possession of the Achæans, and was of strategic value in the war between Cæsar and Pompey. In B.C. 31 Augustus removed the inhabitants to Nicopolis, a city then founded to commemorate the victory of Actium. The site is generally believed to be at the Kastro of Kurtaga, on the river Phidharis, where are remains of walls and gates, as well as terraces and foundations. Consult Woodhouse, *Ætolia* (Oxford, 1897).

CALYDON. A great forest, supposed to have once existed in the north of England and mentioned in Arthurian romance. It may have corresponded with the thickly wooded district of the 'midlands,' which reached up into Yorkshire, and which contained the 'Sherwood' associated with the Robin Hood legends.

CALYDONIAN BOAR. According to a Greek myth, a certain Ceneus, King of Calydon, in Ætolia, omitted a sacrifice to Artemis, whereupon the goddess, in her rage, sent into his fields a frightful boar, which committed great devastation. No one had the courage to hunt it except Meleager, the son of Ceneus, who, calling to his help the bravest heroes of Greece—Theseus, Jason, Nestor, and others—pursued and slew the monster. This hunt is a favorite subject in Greek art, and appears not only on the vases and reliefs, but was also represented in the pediment of the Temple of Athena Alea at Tegea by the great sculptor Scopas, of whose work some fragments have been found, and are now in Athens. See MELEAGER.

CALYMMENE, ká-lím'é-nē (Gk. καλύμνη, *kekalymmenē*, fem. perf. part. of καλύπτειν, *kalyptein*, to cover; refers to the thorax and shield). A genus of fossil trilobites characteristic of the Silurian system. It has a rather long body, of oval form, with a semicircular head-shield and a thorax of 13 segments. The tail-shield is lobed like the thorax, and is not clearly distinguishable from the latter. About 60 species of Calymmene have been described from the Silurian and Ordovician strata, and the largest have been found in the lower Devonian rocks. Calymmene blumenbachia and Calymmene senaria are prominent species.

CALYPSO (Gk. Καλψώ, *Kalypsō*). In Grecian legend, a nymph, dwelling alone on a remote island, who rescued the shipwrecked Odysseus, and kept him with her seven years, promising him immortality, but unable to make him cease his longing to return to Ithaca. She finally yielded to a command of Zeus and allowed him to depart on a raft of his own building. Calypso is a somewhat late addition to the Odysseus story, and is merely a name outside of the Homeric poem. Her sons by Odysseus are entirely without connection with the general story.

CALYPTRA (Gk. καλύπτρα, *kalyptra*, from καλύπτειν, *kalyptein*, to conceal). A term commonly applied to the enlarged and ruptured archegonium (female organ) of the true mosses, which is carried up as a loose hood, capping the spore-case. Its application is often extended, however, to include any development of the archegonium which follows fertilization. See MUSCI.

CALYX (Lat., Gk. κάλυξ, *kalyx*, cup of a flower, from καλύπτειν, *kalyptein*, to cover). In flowers, the outer and sometimes the only set of floral leaves. The individual parts are called 'sepals,' and when these are not present the flower is said to be 'naked.' The sepals are usually green and leaf-like, and serve to protect the more delicate inner parts in the bud, but sometimes they are very much modified. See FLOWER.

CAM (Kelt., crooked), or GRANTA. A river which rises in Essex, England, and is known as the Granta until it joins with the Rhee, 3 miles above Cambridge, to which city it gives its name. After a northeasterly course of about 40 miles through Cambridgeshire, it joins the Ouse, 3½ miles above Ely. It is a favorite boating river, famous in connection with the boat-races of the students of Cambridge University.

CAM (dialectic form of Engl. *comb*; cf. Ger. *Kamm*, comb, *Kammrad*, cog-wheel). A revolving disk eccentrically mounted on a shaft and employed in mechanism to impart by its rotation a reciprocating motion to a rod or shaft. One of the common forms of cam is a heart-shaped wheel mounted on a shaft as shown at A. The operation of this form of cam may be indicated by the lever B, pivoted at the centre and carrying at one end a rod, C, and at the other end a wheel, D, which has a rolling bearing against the face or edge of the cam. As the cam rotates, the wheel, D, will be raised and lowered, and this movement will, through the medium of the lever, B, raise and lower the rod, C, so as, for example, to open and close a valve. Cams are made in a great variety of shapes. By cutting teeth on the edge of the cam, A, and

also on the edge of the wheel, *D*, and arranging the two so that their teeth mesh, we have what is called a 'cam gear-wheel' arrangement. A circular wheel, mounted concentrically on a

CAM.

shaft and having a lug or projection at intervals on its edge, is called a 'cam-wheel.' Cams and cam-wheels are extensively employed in mechanisms for all sorts of purposes.

CAM, KĀN, AUGUSTE NICOLAS (1822—). A French sculptor, born in Paris. He was educated in the atelier of Rude, and until about 1865 confined himself almost entirely to the representation of small animals. Afterwards, however, he departed from this genre and preferably represented combats between beasts of prey. His best-known works are: "Linnets Defending Their Nest Against the Rat" (1846); "Frogs Demand a King" (1851); "Tiger in Conflict with a Crocodile" (1870); "Rhinoceros Attacked by Tigers" (1884, Garden of the Tuileries); "Eagle and Vulture Wrangling Over the Carcass of a Bear" (1890).

CAM, KĀN', or CĀO, KOUN, DIOGO. A Portuguese navigator of the Fifteenth Century, who continued the African discoveries inaugurated by Prince Henry. In a voyage made in 1484-85 he sailed along the west coast of Africa as far as the Congo. He had sufficient influence with the King of Congo to induce that monarch to permit the establishment of Christianity in his dominion.

CAMACHO, KĀ-mă'chō. The unhappy bridegroom of Quiteria in Cervantes's *Don Quixote*. He is cozened out of his wife, after he has prepared a great feast in her honor.

CAMAJUANI, KĀ-mă-hwă'né. A city of Cuba, in the Province of Santa Clara, about 20 miles from the northern coast of the island. It is connected by rail with Havana, Cardenas, and the coast. Population, in 1899, 5082 (municipal district, 14,495).

CAMALDOLITES. A religious order, founded in the vale of Camaldoli (Neo-Lat. *Campus Madoli*), near Arezzo, in the Apennines, in 1012, by Saint Romuald (c.950-1027), a Benedictine monk, and a member of the family of the dukes of Ravenna. It soon spread through Italy. The brethren, who wear white garments, are, and have always been, characterized by the excessive rigidity of their monastic rule, yet on festival days they are allowed to eat fish and drink wine. The order has greatly declined, until now it has only six monasteries and about 200 members. Its greatest ornaments have been Gratian, the great canonical jurist of the Twelfth Century, and Pope Gregory XVI. (1831-46). There was an order of nuns of the name, but it has now only convents

in Rome and Florence. The former convent of Camaldoli, near Naples, is famous for the unsurpassed view of the Bay of Naples which its garden affords.

CAMALIG, KĀ'mă-lég'. An inland town of the Philippines, in the Province of Albay, Luzon. It lies 7 miles west of Albay, the capital, in a plain near the source of the Juaya River. Population, in 1898, 14,868.

CAMARA Y LIBERMOORE, KĀ-mă'rā é lē'bār-mō-ō'rā, MANUEL DE LA (1836—). A Spanish naval officer. He was born in Malaga, graduated at the naval academy in San Fernando, and served in the Mexican campaign as staff officer of Admiral François Jurien de la Gravière, and later acted successively as lieutenant on the *Vencedora* and sailing master on the *Villa de Madrid*. He subsequently figured prominently in the campaign against Peru and Chile, and in the struggle with Cuba (1868-78), and, with the rank of captain, commanded a squadron in the Philippines. He was then appointed chief of the naval commission to the United States and London, and as vice-admiral commanded the squadron dispatched to the Philippines during the progress of the Spanish-American War. This squadron, consisting of the *Pelayo*, *Cárlos V.*, *Audaz*, *Osado*, *Proserpina*, *Rápido*, *Patriota*, *Buenos Aires*, *Isla de Panay*, *Colón*, *Cavadonga*, and *San Francisco*, sailed from Cadiz, with 3000 soldiers, on June 16, 1898, and had already passed the Suez Canal en route for the Philippines, when the news of the destruction of Cervera's fleet compelled it to return.

CAM'ARAI'ZAMAN. A prince in one of the tales of the *Arabian Nights* who fell in love with the Princess Badoura as soon as he caught sight of her.

CAMARILLA, KĀ'mă-rē'lyā (Sp., little room, from Lat. *camara*, vault). As *camara* is used to designate the chamber of the King of Spain, the royal chamber, so *camarilla* is used to designate his private chamber or cabinet, the place where he receives his most intimate friends, courtiers, and sycophants. In the political language of modern Europe it has come to signify the influence exercised on the State by secret and unaccredited counselors, in opposition to the opinions of the legitimate Ministry. The *camarilla* is an old institution in Spain, but the word first began to be widely used in the time of Ferdinand VII.

CAMARINA, KĀ'mă-rē'nā (Gk. *Kamárina*, *Kamarina*). A ruined city in Sicily, about five miles in circumference and about 100 miles southwest of Syracuse, not far from the sea. It is east of the Camarina (ancient Hipparis) where, on a sand-hill 100 feet high, now stands the Chapel of the Madonna di Camarina. It was founded by Syracuse B.C. 599, destroyed in 553 for rebellion, rebuilt by Hippocrates of Gela in 492 after the battle of the Helorus, again depopulated in 484 by Gelon, who transferred the inhabitants to Syracuse, and again colonized from Gela in 461. In 405 Dionysius compelled the inhabitants to accompany him on his retreat, and it was destroyed by the Carthaginians. In 339 it was recolonized by Timoleon, and in 258 fell into the hands of the Romans, who sold most of the citizens into slavery. In A.D. 853 it was destroyed by the Saracens, who left only the ruined walls and temples that now attest its ancient splendor.

CAMARGUE, ká'mārg', ISLE DE LA. See BOUCHES-DU-RHÔNE.

CAM'ASS RAT (Am. Indian). The pocket-rat of the northwestern United States, which feeds mainly on the camass (*Camasia esculenta*). See GOPHER.

CAMAYEU, Fr. pron. ká'má'yě', or MONOCHROME (Fr. *camaïeu*, cameo, and Gr. *μῶνος*, *monos*, one + *χρῶμα*, *chrōma*, color). Terms by which painting in one color is designated. The ancients painted thus both in gray (*en grisaille*) and in red. Pictures of several tints, but where the natural colors of the object are not copied, are said to be *en camayeu*. As one color generally prevails, we speak of blue, red, yellow, green camayeu. Polidoro Caravaggio, for example, so overlaid his other colors with brown that his works give the impression of monochrome paintings. Drawings in India ink, red and black chalk, pencil, etc., as well as engravings, may be said to be *en camayeu*.

CAMBACÈRES, kām'bá'sá'rēs', JEAN JACQUES RÉGIS, Duke of Parma (1753-1824). A French statesman. He was born in Montpellier, and became a member of the Convention, where his judicial training at once brought him into prominence. His moderation in the midst of stirring events was soon manifested, particularly in his attitude toward the condemnation of the King. After the fall of Robespierre, he succeeded for a short time to the presidency of the Convention, and he at once began working for peace at home and abroad. Forced from office, he devoted himself to his *Projet de code civil*, from which the Code Napoléon was derived. In October, 1796, he became president of the Council of Five Hundred, and in June, 1799, Minister of Justice. After the eighteenth Brumaire (November 9, 1799) he became Second Consul under Napoleon, who, on ascending the throne, made him High Chancellor of the Empire and in 1808 Duke of Parma. In 1813-14, while Napoleon was absent in the field, Cambacères directed civil affairs as president of the Council of Regency, finally voting for Napoleon's abdication, but during the Hundred Days he reluctantly served Napoleon as Minister of Justice and president of the House of Peers. After the Second Restoration Cambacères returned to Paris, but was exiled in 1816 as a 'regicide.' His legal and political rights were restored to him in 1818. He took no part in public life afterwards and died March 8, 1824.

CAMBALLO. The second son of Cambuscan, in Chaucer's *Squire's Tale*. In the prologue to the tale it is prophesied that the unfortunate falcon will "get her love again" by his 'meditation,' and that he will fight in the lists for Canace's sake. But how he accomplishes this is left unexplained. He appears in Spenser's *Faerie Queene* as Cambel.

CAMBALUC, kām'bá-lōōk', or **CAMBALU**, kām'bá-lōō' (Mongol *Khan-Baligh*, 'city of the Khan'). The former name of Peking (q.v.), China.

CAMBAY' (Hindi *Khambāt*, from Skt. *kham-bavati*, possessing pillars). The capital of the native State of Cambay, Gujerat, India, standing at the head of a gulf of the same name, on the right bank of the Mahi, 76 miles to the north-northwest of Surat (Map: India B 4). It contains about 30,000 inhabitants, but was at

one time much more populous; ruined palaces, mosques, and tombs, and an excavated temple of considerable pretensions, attest its former magnificence and extent. The gradual obstruction of seaward navigation has contributed to its decline. The export of cotton is the staple trade and it has celebrated manufactures of onyx, agate, and carnelian ornaments.

CAMB'EL. See CAMBALLO.

CAMBERT, kām'bār', ROBERT (c.1628-77). A French composer. He was organist of the Church of Saint Honoré, and musical superintendent to Anne of Austria, the mother of Louis XIV. At the suggestion of the Abbé Perrin, he composed *La pastorale* (1659), regarded as the first French musical comedy. Cambert may therefore be considered as the founder of French opera. Under the favor of Louis XIV. and Mazarin, the *Pastorale* was followed by *Ariane et Bacchus* (1661); *Pomone* (1671); and *Les peines et les plaisirs de l'amour* (1672). Together with Perrin, who furnished the text for his operas, Cambert became director of the first French opera house, the Paris "Académie Royale de Musique," but was soon superseded by his rival Lully. After Lully became musical superintendent to the King, Cambert went (1673 or 1674) to London, where he became master of the music to Charles II.

CAM'BERWELL. Part of Greater London. See LONDON.

CAMBERWELL BEAUTY. The English name for the widespread butterfly *Vanessa antiopa*, called the United States 'mourning-cloak' (q.v.).

CAMBIASO, kām-byā'sō, LUCA (1527-85). An Italian painter, born in Moneglia. He gained celebrity at an early age, and in 1583 was invited to Spain by Philip II. to assist in the decoration of the Escorial, in which he painted the ceiling of the choir, representing the "Assemblage of the Blessed," which is considered his best work. Among others of his works are the "Rape of the Sabine Women," the "Sleeping Cupid," and "The Martyrdom of Saint George."

CAMBIER, kām'byá', ERNEST (1844—). A Belgian explorer, born in Ath. In 1877 he accompanied the first expedition sent out by the International African Association as astronomer and geographer, and upon the death of Crespel was appointed chief of the expedition. He penetrated from Bagamoyo into the interior of Africa, proceeding to Unyamwezi, and thence to Karema on Lake Tanganyika, where, in September, 1879, he established the first post and scientific station of the International Association. He returned to Europe in 1882. Consult A. J. Wauers, *Le capitaine Cambier et la première expédition de l'Association Internationale Africaine* (Brussels, 1881).

CAMBI'NA. The mistress and eventual wife of Cambel in the *Faerie Queene*. She has inherited her mother's (Agape's) supernatural abilities.

CAMBIUM (Neo-Lat., from Med. Lat. *cam-bire*, to exchange). A zone of actively dividing cells between the wood and bark of ordinary shrubs and trees. See ANATOMY OF PLANTS.

CAMBO'DIA (Skt. *Kambōja*). Once a powerful kingdom of extreme southeastern Asia;

latterly a French possession, constituting one of the divisions of the general government of Indo-China (Map: Siam, K 8). Two of its provinces, however, have become annexed to Siam, its neighbor on the northwest. Cambodia is bounded by Annam on the east and by Cochinchina and the Gulf of Siam on the south. The parallel of 12° N. crosses it about the middle. Its area is about 37,500 square miles, divided among 57 native provinces. The country has scarcely been explored, and there is comparatively little known about it. It is generally level. The western, northwestern, and eastern portions, however, are more or less broken with wooded hills and plateaus, reaching a height of about 4000 feet in parts. The great waterway is the navigable Mekong River, which annually overflows and richly fertilizes a wide territory. An arm connects the Mekong with an extensive lake on the borders of Siam, called Tonle Sap, which, according to the alternations of low and high water, at one time discharges its surplus waters into that river and at another is replenished by the waters sent forth by the Mekong.

Despite the fact that Cambodia is in the torrid zone and on the whole a low-lying region, its climate is not as intolerably hot as might be expected, the heavy rains moderating the temperature. The main climatic features are determined by the monsoons. There are two seasons, the wet and the dry. The flora and fauna are characteristic of the Indo-Chinese region. Tigers, leopards, and elephants are found in many sections. Gold, silver-bearing lead, copper, iron, and lime exist, but only the last two are profitably available. The fisheries form a notable industry, both along the islands of the coast and on the Tonle Sap (q.v.).

Agriculture is the leading occupation. The well-populated river plains and islands produce rice, the main food of the country. Cotton, tobacco, pepper, cardamom, beans, sugarcane, maize, indigo, the mulberry, coffee, cacao, and vanilla are grown. Cattle-raising is quite general. Some eighty kinds of valuable wood are found, such as ebony, rose, sapan, and pine. The gathering of these woods, together with palm-sugar, wax, and gum, forms a noteworthy branch of industry. Silk-weaving is a large domestic occupation. There are considerable factories for shelling cotton-seeds near the capital, Pnom-Penh (q.v.), a city of about 50,000 people, situated in the heart of the country. Cambodia has no seaport of commercial importance, Kam-pot having merely a local or inland trade. Generally speaking, however, easy communication is had, both by land and by water, with the interior. Telegraph lines connect the principal towns with each other, and with Burma. But there are no railways, no modernized facilities for transporting articles of commerce. The export and import trade is through Saigon, the capital of Cochinchina. The exports include chiefly rice, and salted fish (about 13,000 tons annually). Cotton, tobacco, gum, and wood are exported. The imports embrace silk stuffs, salt, wine, opium, textiles, and arms. The total annual value of the commerce, including both imports and exports, as given by French authorities, is about \$5,000,000.

Cambodia has been under the protection of France since 1863. The government is a monarchy. The King has five ministers. In 1884,

under the new treaty signed with King Norodom, the administration was practically handed over to France, the native functionaries being appointed by the King with the approval of the local French officials, who are under the direction of the Governor-General of French Indo-China, who is represented by a resident. The budget of Cambodia for 1901 was fixed at 1,951,487 piastres. The inhabitants are estimated at 1,500,000, nearly four-fifths of whom live in the river regions.

Outside of recent Annamite and Chinese immigrants and a considerable body of Malays, the population of Cambodia consists mainly of the Cambodians proper, or Khmers, formerly widespread over much of Indo-China, to whose half civilization belong the wonderful architectural remains of Angkor (now in Siamese territory), etc.; the Penong, or 'savages,' of the eastern table-lands and mountains, belonging, with the Moïs of the adjacent regions, to a primitive element of the population; the Khoïs, or Kuïs, another aboriginal group in the northwest; and lastly, the Tsiam, or Chiam, in the south, who seem to be the survivors of the extinct empire of Champa, once dominant over all eastern Indo-China. All these peoples are now considerably mixed, the Khmers most, the mountain aborigines least, with Aryan (Hindu), Dravidian, Malay, and Tibeto-Chinese blood and with the Hindu influence (the alphabet of the Cambodians and the sacerdotal vocabulary are of Pāli origin) predominating in religion, art, and literature among the more civilized sections. The Penong are rather short, dolichocephalic, much lighter-skinned than the surrounding peoples; the Khoïs, darker-skinned, taller, and inclined to be short-headed; the Tsiam, dark-skinned and rather handsome in form and features, with some negroid suggestion in hair, etc. The Khmers are taller and less Mongoloid in appearance than the Annamese, Siamese, and closely related peoples. In speech the Penong and Khoïs probably represent a primitive variety of Indo-Chinese stock. The Khmer language differs in certain marked respects from the latter, and, like that of Tsiam, is said to have Malayan affinities, but this is not clearly made out, and the speech of the Khmers is largely *sui generis*. Buddhism is the prevailing religion. Some of the Tsiam profess Islam. Christianity and education have scarcely made a beginning. The Khmers are peaceful and teachable, but phlegmatic. Polygamy is practiced, but not more than three wives are permitted. The dwellings are mostly along the river-banks. Slavery has almost disappeared, having been abolished by the French in 1884.

That Cambodia was once an extensive and powerful State and under a much higher grade of civilization than at present is shown by the superb architectural remains, the ruins of Angkor being especially noticeable. The early history of Cambodia, like that of Siam and Annam, with whose fortunes its own were often closely connected, is extremely obscure; but legend would seem to point to India as the source of the earliest migrations into the country. From Chinese notices it is known that a kingdom of Cambodia was already in existence not very long after the beginning of the Christian Era, and that, after a short period of submission to China, in the Sixth or Seventh Century, it attained to a high degree of splendor. With the beginning

of the Fourteenth Century, the period of decadence set in, the kingdom grew exhausted in continuous warfare against Siam and Annam, and was forced to pay tribute to each in turn, or to both. The first Europeans in Cambodia were the Portuguese, who founded a mission there in 1553. The attempts made by the Dutch and the English to establish themselves in the region proved unsuccessful, and when the French first turned their attention to the land, in the middle of the Nineteenth Century, European influence was non-existent there.

Consult: Verschuur, *Aux colonies d'Asie et dans l'Océan Indien* (Paris, 1900); Lagrillière-Beaulerc, *A travers l'Indo-Chine, Cochinchine, Cambodge, Annam, Tonkin, Laos* (Paris, 1900); Leclère, *Cambodge, contes et légendes* (Paris, 1895); id., *Recherches sur la législation cambodienne: Droit privé* (Paris, 1890); *Droit public* (1894); *Législation criminelle* (1894); Wake, "Les Cambodgiens et leur origine," in the *Revue d'Anthropologie* (1886); Bergargne, "L'ancien royaume du Campa," in the *Revue Asiatique* (1888); Fournereau, *Les ruines khmères* (Paris, 1890).

CAMBODIA RIVER. See MEKONG.

CAMBOGE, kām-bōj'. See GAMBOGE.

CAMBON, kām'bōn', JULES MARTIN (1845—). A French legislator and diplomat, brother of Pierre Paul Cambon. He was born in Paris, and began the practice of law in 1866. After serving in the war of 1870-71, he was appointed auditor of the provisional commission appointed in 1871 to replace the Council of State. In 1874 he was appointed director-general of the civil affairs in Algiers; in 1879, secretary-general of the prefecture of police in the Department of the Seine; and in 1891 Governor-General of Algeria. He was Ambassador of France at Washington from 1891 to 1902, and in this capacity negotiated the preliminaries of peace between the United States and Spain.

CAMBON, PIERRE JOSEPH (1754-1820). A French financier and politician. He was born in Montpellier, and was a merchant there at the beginning of the French Revolution. He was a member of the Legislative Assembly in 1791 and of the Convention in 1792. From the outset he devoted himself to financial questions, of which he speedily showed himself a master. As France, during the Revolution, was at war with all Europe, vast sums of money had to be raised. The financial condition was desperate, due to the excessive number of assignats in circulation and their consequent depreciation, and also to the general ignorance as to the actual debt of the country. Cambon proposed to prepare a 'grand livre' of the national debt. This plan was set forth in his great *Rapport sur la dette publique* (August 15, 1793), on which his fame as a financier chiefly rests. Cambon was a member of the first Committee of Public Safety. Throughout the Reign of Terror he was the real administrator of the finances. He opposed the financial measures of Robespierre, who attacked him by name in the Convention. Later he was arrested for having defended Callot d'Herbois and other members of the Committee of Public Safety, but was released in the general amnesty of 1795. In 1815 he sat in the Chamber during the Hundred Days. He was finally exiled as a regicide in 1816, and he died in Brussels.

CAMBON, PIERRE PAUL (1843—). A French legislator and diplomat, born in Paris. He became chief of Cabinet of the Prefecture of the Seine, under Jules Ferry, in 1870, and thereafter Secretary-General of the departments of Alpes-Maritimes and Bouches-du-Rhône (1871), and prefect of Aube (1872). Subsequently he held several other prefectures, but in 1882 abandoned the legislative for the diplomatic service, and after filling the position of Minister of France to Tunis, was successively appointed Ambassador to Madrid (1886), Constantinople (1890), and London (1898).

CAMBORNE. A market-town of Cornwall, England, 10 miles west-northwest of Falmouth (Map: England, A 6). It is surrounded by very productive copper, tin, and lead mines. Its parish church is a handsome Gothic structure. Population, in 1901, 14,700.

CAMBRAI, or CAMBRAY, kām'brā'. A town of France in the Department of the Nord (French Flanders), situated on the right bank of the Scheldt, 121 miles by rail north-northeast of Paris (Map: France, K 1). It is well built, and has a fine cathedral containing the remains of Fénelon, Archbishop of Cambrai, a magnificent town hall, and a number of other fine buildings. Cambrai is the seat of an extensive textile industry, and contains, besides, a number of sugar-mills, soap-factories, tanneries, and many other industrial establishments. Cambrai was known to the Romans under the name of Camaracum, and it was then one of the chief cities of the Nervii. It was fortified by Charlemagne, and was long governed by its own bishops. Here was formed in 1508 the celebrated League of Cambrai, consisting of the Pope, the Emperor of Germany, and the kings of France and Spain, whose object was the destruction of the Republic of Venice. Here, also, was concluded in 1529 the peace between Francis I. and Charles V., known as the *Pax des Dames* ('Ladies' Peace'), the preliminary negotiations having been conducted by Louise, mother of the French King, and Margaret, aunt of the German Emperor. Cambria has been in possession of France since 1677. Consult Dinaux, *Bibliographie Cambrienne* (Douai, 1822). Population, in 1896, 14,306.

CAMBRIA. The ancient name of Wales, the Britannia Secunda of the Romans. The name is derived from that of the Cimbri, or Cymri, by which the Welsh have always called themselves.

CAMBRIAN SYSTEM. The name given to the great series of sedimentary deposits which comes next in order of succession to the Archaean, the lower beds of the Cambrian system resting unconformably on its upturned edges. The name Cambrian, derived from Cambria, the ancient name of Wales, in which country the beds of this age were first recognized, was given by Adam Sedgwick, an eminent English geologist, who devoted his life to the study of this formation. The upper limits of the Cambrian, as there studied, were in much dispute for a time, since many of the beds placed by Sedgwick in the Upper Cambrian were claimed by Murchison to be Lower Silurian; and this, indeed, was subsequently found to be the case. To these disputed beds the name Ordovician (q.v.) was given by Lapworth (1879). Fossils are very scarce in the Cambrian rocks in many

places, but in other localities, where different members of the formation are exposed, life remains abundant, showing a profusion of marine invertebrates and plants of low order. The animal remains include, in order of their importance, crustaceans, brachiopods, pteropods, worms, gastropods, hydrozoans, echinoderms, sponges, corals, lamellibranchs, and cephalopods. All of these, except the cephalopods, were represented in the earliest periods of the Cambrian system.

While the great thickness of Cambrian strata indicates a long period of sedimentation, still the great changes that we find in the faunas in passing from one division of the Cambrian system into another are considered remarkable, since they indicate a most complete revolution in the life forms in any one region. Thus, of the many trilobites found in the Lower Cambrian, but few are known in the middle division; and these, in turn, differ markedly from those in the Upper Cambrian. The reason for this absence of transitional types may be due to the fact that the intermediate beds containing them have not yet been discovered. The trilobites were a prominent feature of the Cambrian system, and varied much in size, from under an inch, like the small, blind ones, agnostus, to others having a length of two feet, as paradoxides. No vertebrate remains have been found. There is no evidence of invertebrate life that existed on land in fresh water, although it is quite possible that some of the mollusks found may have lived in estuaries of brackish water, for the character of many of the sedimentary rocks of Cambrian time, such as grits, with ripple-marks, is indicative of shallow-water conditions.

The thickness of the Cambrian system is variable. In Newfoundland it is about 6000 feet; in Vermont and eastern New York, 7000 feet; in British Columbia, 10,000 feet. The Cambrian rocks include sandstones, limestones, shales, slates, marbles, and quartzites, with occasional igneous rocks, as in the Lake Superior region and southeastern Pennsylvania, and also in Great Britain. The metamorphosed Cambrian rocks are found in areas of much folded strata. In America the Cambrian rocks have been classified under: (1) *Georgian* series, or Lower Cambrian, a local development in Michigan being known as the *Keeweenawan*, or *Keeweenawian*; in this the trilobite *olenellus* is often common. (2) *Acadian*, or Middle Cambrian, in which the trilobite *paradoxides* is abundant in places. (3) *Potsdam*, or Upper Cambrian.

In North America Cambrian rocks are found in Newfoundland, Nova Scotia, New Brunswick, and Canada: also in Vermont, Massachusetts, Maine, New Hampshire, Rhode Island, New York, New Jersey, Pennsylvania, Maryland, Tennessee, Alabama, Georgia, Michigan, Wisconsin, North Dakota, California, Colorado, Arizona. In foreign countries, they are known in Great Britain, Germany, Bohemia, Scandinavia, France, Spain, Sardinia, China, Australia, and India. The British, Bohemian, and Scandinavian areas are of classic interest. The economic products of the Cambrian system in the United States include the slates (q.v.) and limonite ore (q.v.) of the Appalachian States, sandstone in New York, and copper ores in Michigan.

Consult: Walcott, *Tenth Annual Report United States Geological Survey* (Washington, 1888); *Bulletin 81, United States Geological Survey* (Washington, 1891); Dana, *Manual of Geology* (New York, 1895); Geikie, *Text-book of Geology* (London, 1893). See GEOLOGY; POTSDAM SANDSTONE.

CAMBRIC, kām'brīk. A general term applied to the finest and thinnest of linen fabrics. It is said to be derived from Cambrai (France), where such goods were first made. Some of the finest cambrics of the present day are produced in Switzerland. Scotch cambric is really a muslin, and is made of cotton with the fibre twisted very hard, to imitate real or linen cambric.

CAMBRIDGE, kām'brīj (Cam bridge; Neo-Lat. *Cantabrigia*). The county-town of Cambridgeshire, England, situated on the Cam, about 57 miles north-northeast of London (Map: England, G 4). The town, as a whole, is less picturesque than its rival, Oxford, and its main street, Trumpington, does not compare favorably with the famous High Street of Oxford. On the other hand, many of its college buildings are, from an architectural standpoint, the equal of any which its sister university possesses; and the beautiful lawns and gardens behind the colleges, traversed by the Cam, familiarly known as 'the Backs,' certainly equal in beauty the justly praised Christ Church Meadow of Oxford. Apart from the colleges and the buildings immediately connected with them, Cambridge possesses few interesting features. The Church of the Holy Sepulchre is worthy of note as being one of the four existing round churches in England. Cambridge is a Parliamentary borough, and sends one member to the House of Commons. The city maintains a large public library and makes large grants to a number of schools. Its water, gas, and electric-light plants are in the hands of private companies. Its drainage and sewerage system has been recently improved. Population, in 1891, 37,000; in 1901, 38,400. Cambridge, probably on the site of the *Camboritum* of the Romans, takes its name from the river Cam, which was anciently, and is still in its upper reach, called the Granta. To the Saxons, Cambridge appears to have been known as Grantabrydge. In 870 the Danes ravaged the country hereabouts, and are said to have destroyed the town. William the Conqueror built a castle here, and the town received its first charter from Henry I. in 1118. King John, in 1200, granted a charter to the town, permitting it to have a guild of merchants, and in 1207 confirmed the burgesses in their privileges in perpetuity. See CAMBRIDGE, UNIVERSITY OF.

BIBLIOGRAPHY. Atkinson, *Cambridge Described and Illustrated* (London, 1897); Humphry, *Cambridge* (Cambridge, 1880); Maitland, *Cambridge Township and Borough* (Cambridge, 1898); Wood, "Cambridge in Early and Medieval Times," in *Builder*, Vol. LXXXI. (London, 1901).

CAMBRIDGE. A village and county-seat of Henry County, Ill., 30 miles southeast of Rock Island, on the Rock Island and Peoria Railroad (Map: Illinois, B 2). It is the centre of a fertile agricultural region, and exports live stock and grain. Population, in 1890, 940; in 1900, 1345.

CAMBRIDGE. A city and county-seat of Dorchester County, Md., 60 miles southeast of Baltimore, on the Choptank River, and on the Seaford and Cambridge Railroad, which connects with the Philadelphia, Wilmington and Baltimore at Seaford, Del. (Map: Maryland, N 6). It is the centre of a rich agricultural district, and has an extensive oyster-canning industry, and important manufactures of underwear and lumber. Settled in 1684, Cambridge was incorporated as a Colonial town early in the Eighteenth Century; the present city charter dates from 1900. Under its provisions, the mayor is elected every two years by the city council, which consists of the executive and four aldermen, chosen by the city wards. Population, in 1890, 4192; in 1900, 5747.

CAMBRIDGE. A city, the seat of Harvard University, and one of the county-seats of Middlesex County, Mass. It is on the Charles River opposite Boston, of which it is practically a suburb, being connected by several bridges (Map: Massachusetts, E 3). It is entered by the Boston and Albany and the Boston and Maine railroads, and electric railroads connect with Boston and adjacent towns. The historic divisions are still locally known as Old Cambridge, North Cambridge, East Cambridge, Cambridgeport, and Mount Auburn. Cambridge is irregular in shape, generally level in surface, and covers an area of about $6\frac{1}{2}$ square miles. Its streets and avenues are shaded with beautiful old trees, and there are many handsome residences and well-preserved Colonial mansions, among them the Craigg House, occupied by General Washington, and later the home of the poet Longfellow, now fronted by a memorial park, and Elmwood, the dwelling of James Russell Lowell. The principal features of Cambridge are Harvard University (q.v.), with its ample grounds and many buildings, Radcliffe College (q.v.), the buildings of the Protestant Episcopal Divinity School, the First Parish Church (Unitarian), the Shepard Memorial Church (Congregational), commemorating Rev. Thomas Shepard (q.v.), and Christ Church (Protestant Episcopal). The city common contains a soldiers' monument and a statue of John Bridge. Less than a mile from the university are the Howard Observatory and the botanical gardens of eight acres, filled with a great variety of trees, shrubs, and plants, especially of native species. Mount Auburn Cemetery, partly in Cambridge, one of the most beautiful places of burial in the country, contains the graves of Longfellow, Lowell, Phillips Brooks, and many other distinguished men. Among prominent buildings, other than those already mentioned, must be noted the public library, Cambridge Hospital, the Latin School, High School, Rindge Manual Training School, the city hall, the court-house, jail, and other county buildings. Cambridge has a fine system of public parks; besides Interior Parks, the River Parks include the entire river-front, and add greatly to the beauty of the city.

Among the industrial establishments of Cambridge are the Riverside, Athenæum, and University presses, the latter dating from the earliest printing house in America, founded in 1639, which are all widely known. There are also large foundries and machine-shops, meat-packing houses, and extensive manufactures of soap and

candles, pianos and organs, furniture, confectionery, rubber goods, boilers, chemicals, astronomical instruments, carriages and automobiles, bricks, and many other articles. The industries are centred principally in Cambridgeport and East Cambridge.

Cambridge is governed, under the charter of 1891, by a mayor, elected annually, and a bicameral municipal council, of which the board of aldermen is elected at large and the common council by wards. In the administrative departments, the majority of officials are appointed by the mayor, subject to the confirmation of the board of aldermen; the city council, however, elects the city clerk and assistant, treasurer, auditor, messenger, clerk of committees, solicitor, and overseer of the poor; and members of the school board are chosen by popular election. Cambridge owns and operates its water-works. Some features of municipal politics deserve mention. Cambridge is noted as the largest city in the world with no open saloons, and the license system, as operated under the Massachusetts law, seems well established. Municipal elections are conducted by local parties entirely independent of national and State organizations.

HISTORY. Cambridge originally included the present towns of Lexington, Arlington, and the Brighton district of Boston. It was settled at Newtowne, in 1630, by Governor Winthrop and others, who intended it to be the chief place of the Colony, but found the peninsula of Shawmut (Boston) better adapted for commerce and for defense against the Indians. Resettled in 1631, it received, in 1633, its first pastor and teacher, Rev. Thomas Hooker (q.v.) and Rev. Samuel Stone (q.v.), who removed with their congregation to Connecticut in 1636, largely owing to ecclesiastical differences. In 1637 the General Court ordered that the college it had previously decided to found be established at Newtowne, and in 1638 that Newtowne become Cambridge. In the same year the first class began its studies, and the name Harvard College was given to the modest institution. (See HARVARD, JOHN.) During the time Boston was held by the British Army (1775-76) Cambridge was occupied by the American Army, and Washington assumed command in 1775 under a large elm, which is still standing. The city charter of incorporation was granted in 1846. Cambridge claims to have enlisted the first company of volunteers for service on the Northern side at the outbreak of the Civil War, and during that conflict it furnished 4588 men to the Union army and navy. The city has been the home of many famous literary men, notably of Longfellow, Lowell, and Holmes.

Population, in 1790, 2111; in 1830, 6072; in 1850, 15,215; in 1880, 52,669; in 1890, 70,028; in 1900, 91,886, including 30,500 persons of foreign birth and 3900 of negro descent.

Consult: Paige, *History of Cambridge* (Boston, 1877); Hurd (editor), *History of Middlesex County* (Philadelphia, 1890); and Powell, *Historic Towns of New England* (New York, 1898).

CAMBRIDGE. A village in Washington County, N. Y., about 30 miles northeast of Albany, on the Delaware and Hudson Railroad (Map: New York, G 2). It is noted principally as the seat of the Cambridge Valley Agricultural

and Stockbreeders' Association. Population, in 1890, 1598; in 1900, 1578.

CAMBRIDGE. A city and county-seat of Guernsey County, Ohio, 85 miles east of Columbus, on the Baltimore and Ohio and the Pennsylvania railroads (Map: Ohio, G 5). The surrounding region has deposits of fine pottery clay, natural gas, coal, and iron; these with the manufacture of various products of iron and steel, glass, and pottery, are the principal fields of industry. The city owns and operates its water-works, and has a public library. Settled in 1806, Cambridge was incorporated in 1837. It is governed by a charter of 1893 which provides for a mayor, elected biennially, and a city council. Population, in 1890, 4361; in 1900, 8241.

CAMBRIDGE, ADA (1844—). The pseudonym of Mrs. George Frederick Cross, novelist, born at Saint Germans, Norfolk, England, and after 1870 a resident of Victoria, Australia. She has become widely known by *A Marked Man* (1891); *The Three Miss Kings* (1891); *A Little Minx* (1893); *At Midnight* (1897); *Materfamilias* (1898); *Path and Goal* (1900); and *The Devastators* (1901). She has also written several poems displaying lyrical power. See AUSTRALIAN LITERATURE.

CAMBRIDGE, GEORGE WILLIAM FREDERICK CHARLES, second Duke of (1819—). An English soldier, son of Adolphus Frederick, Duke of Cambridge. He was born in Hanover, and succeeded to his title in 1850. In 1837 he was colonel, and in 1854 lieutenant-general, commanding the first division sent in aid of Turkey against Russia. He led the troops at the Alma and at Inkerman. In consequence of ill health he returned to England, and in 1856 became acting commander-in-chief of the British Army. He was made field-marshal, and in 1887 received the patent of commander-in-chief. In 1895 he was retired, and succeeded by Lord Wolseley (q.v.).

CAMBRIDGE, UNIVERSITY OF. The younger of the two ancient seats of learning in England. The origin of the university, like that of Oxford, is obscure. The old Benedictine establishment in Cambridge was swept away by the Danish invasions, and the university cannot boast the continuous existence beyond the Conquest assigned to it by the older writers. Though we may disregard the various fables of its foundation by a Spanish King, Cantaber, by King Arthur, by a Saxon King, Sigebert, and by Gislebert and his three companion monks of Croyland, it seems very probable that the university originated in some local educational movement during the Twelfth Century, augmented, as time went on, by such influences as the migration of Oxford students thither in 1209, and of students from Paris in 1229. As early as 1231 a chancellor is mentioned in a royal writ, and two years later the university received Papal recognition. Following the example of Paris, Cambridge maintained, besides the trivium and quadrivium (q.v.), or faculty of arts, the advanced faculties of theology, civil and canon law, and medicine. It was, however, not recognized formally as a Studium Generale until the Papal bull of 1318. Like Paris, too, Cambridge was governed by a guild or corporation of masters, resident teachers called regents, with whom resident masters not en-

gaged in teaching, called non-regents, were later associated. The presiding officer, called the chancellor, was elected by the regents. To this new university the mendicant orders came very early, the Franciscans about 1224, the Dominicans half a century later. These, as well as other bodies of monks and of friars, established houses for their members, and for a time played a considerable part in university affairs, but their permanent influence was, save perhaps in one direction, not great. In the earlier stages of the university the students, here as elsewhere, had boarded and lodged independently. With the increasing size and importance of Cambridge there now arose, alongside these religious houses, voluntary associations of students, living together in independent hostels or halls. Private benefactors, finding in these fit subjects for encouragement, presently began to endow these halls, or to establish 'colleges,' often by the consolidation of several halls. This new form of institution, providing for the support of deserving students, combined the idea of supervision and support of the religious houses, with that of the independence of the halls. The collegiate system, beginning on the Continent, seems to have been carried to Cambridge by way of Oxford, and, though not original with either, has survived in them alone, giving them their unique place among the universities of the world. The first of the Cambridge colleges, Peterhouse, a purely academic organization with no monastic discipline, was founded in 1284 by Hugh of Balsham, Bishop of Ely, and from this time for almost exactly three centuries the foundation of colleges continued. With one exception, the Cambridge of to-day is formed of the colleges established during that period. In this, Cambridge differs much from Oxford, for though four colleges were founded in Oxford in the Seventeenth and Eighteenth centuries, the only permanent collegiate foundation in Cambridge since 1596 is Downing College, established in 1807. The short-lived Cavendish College, Selwyn College (1882), a 'hostel,' and the foundations for women, Girton (1869) and Newnham (1875), are not formally connected with the university. (A list of colleges, with the dates of their foundation, will be found at the end of this article, and separate notices of the colleges under their names in the body of the Encyclopædia.)

The university, thus constituted, played a great part in the Reformation. Humanism entered Cambridge early, associated with the names of Sir John Cheke, Sir Thomas Smith, and Bishop Fisher. Of those closely associated with the Reformation, Erasmus was Lady Margaret professor of divinity from 1511 to 1514, and translated the New Testament here. Here, too, William Tyndale and Hugh Latimer began their labors in the new cause, and from here came Cranmer, who, in more ways than one, shaped the English Reformation in later years. The Royal Injunctions of 1535 mark an epoch in the history of the university, for by them the new learning was finally established. The study of the canon law was discontinued, public lectures in Greek and Latin were established in the colleges, the Bible, studied in the light of the new learning, replaced the Sentences, and the humanistic method took the place of the scholastic. As elsewhere, the recognition of the royal supremacy was enforced here, and with these sweeping

changes, and the replacing of the clerical element in the university by lay students, the mediæval history of Cambridge may be said to close and its modern history to begin.

For the moment, however, here, as in all universities which took a leading part in the Reformation, the immediate effect of that movement was disastrous. It was not until the reign of Elizabeth that Cambridge began to recover from the shock. Then it became the stronghold of advanced Puritanism, as it had earlier been of advanced Protestantism, particularly under the influence of Cartwright, who was finally deprived of his official position in the university on this account. Largely owing to the disturbances arising from this, new statutes were enacted in 1570, which lasted till the middle of the Nineteenth Century. By these the government of the university was practically vested in the heads of the colleges, who alone elected the vice-chancellor and the *Caput*, or supervising board. This turned Cambridge into a close corporation, a misfortune not bettered by the fact that with it went a tendency to turn the university into a school of divinity. The reign of James I. is memorable as the period when the university was granted the privilege of returning two members to Parliament, which it still enjoys. The later Seventeenth Century saw the rise of the school of Cambridge Platonists, and, chiefly by the influence of Isaac Newton and Isaac Barrow, the beginnings of that tendency toward the cultivation of mathematics and the natural sciences, which is still one of the chief distinctions between Cambridge and Oxford. During the Eighteenth Century, until the rise of the Evangelical School, the same mediocrity and apathy in religious matters prevailed here as elsewhere, but scholarship was improved by the evolution of the tripos into something like its present position. The Nineteenth Century saw sweeping changes, the reorganization of colleges and university, greater freedom in academic matters, the abolition of religious tests, and a more liberal idea of the importance of certain studies as well as of the relations between certain lines of work. Between 1840 and 1850 several colleges secured new charters from the Crown, and in the latter year a commission began a revision of the statutes, which led to the replacing of the Elizabethan statutes by those of the new commission in 1858. These were in turn altered in 1869 and 1871-72, and in the latter year another commission was appointed, on the strength of whose report (1874), and of a memorial issued by an influential body in the university, the Universities of Oxford and Cambridge Act was passed in 1877, and approved by the Crown in 1882. This effected a reorganization of the entire university system. Meanwhile, various internal changes had been taking place. To the older triposes of classics and mathematics, were added the law tripos in 1858, divided into law and history in 1872, the Semitic language tripos in 1878, the Indian language tripos in 1879, the mediæval and modern language tripos in 1886.

The university at present is a self-governing corporation, administered by a senate, consisting of all doctors and masters, of whom only those in Cambridge have electoral rights. The Council of the Senate, consisting of the chancellor, the vice-chancellor, four heads of colleges, four uni-

versity professors, and eight associates from the senate, prepares agenda for the senate, chooses the vice-chancellor, and in general carries on the ordinary administration of the university. The funds are managed by a financial board, the curriculum is arranged by a general board of studies, separate departments being in the hands of sub-committees, or special boards. The chancellor is an honorary official, as at Oxford, usually some dignitary of the realm, as are also the steward and the deputy steward. The vice-chancellor is the real head of the university, and is assisted by deputies and by two proctors, who, besides their duties in the senate, have charge of university discipline. There are, moreover, two esquire bedells, the public orator, a commissary, an assessor, and the registrar, who has charge of records. There are at present seventeen colleges besides the two foundations for women, several special semi-collegiate institutions not a part of the university, and a body of non-collegiate students. The university proper, as distinguished from the colleges, is possessed of several important institutions. The Fitzwilliam Museum, founded by Viscount Fitzwilliam in 1816, is one of the largest and finest institutions of its kind in England. The university library contains some 200,000 volumes, and a considerable collection of MSS. There are also fine geological and anatomical museums, an excellent observatory, and the university practically controls the extensive printing and publishing establishment of the Pitt Press, as well as Addenbrooke Hospital. Examinations are held and degrees are conferred in the Senate House, which contains also the public offices of the university, and is the meeting-place of the senate.

The existence of the colleges in connection with the university forms a peculiar, and, save for Oxford, a unique educational organization, not easy for an outsider to understand. Briefly, it may be said that the college and the university are separate corporations, in large measure independent of each other, but connected very closely by the fact that they form interacting parts of an educational system, and that they are composed of, and managed by, the same individuals. The university is essentially an examining and degree-conferring body, which examines the candidate at entrance, during his residence, and at the conclusion of his work, and confers degrees on those men who meet its requirements. It regulates the system of education, with respect not only to subjects, but also to quality, and quantity of preparation, it enforces general discipline, and it offers certain educational advantages in its lectures, its libraries, its collections, and similar provisions. The college, on the other hand, receives the entering student, provides him with lodgings and meals, service, and the like, prepares him, by its tutors, for the university examinations, affords him society and recreation, and exercises somewhat more than paternal oversight of his actions. The administration of the colleges is in the hands of a master and fellows, from among whom are chosen the college officials, dean, bursar, and the like, as well as the teaching or tutorial force of the college. These men, as masters of arts of the university, form a great part of the senate, and so virtually govern it as well as the colleges.

Undergraduate life at Cambridge differs somewhat from that at Oxford, and very greatly from that in the United States. Formerly, all men belonged to colleges, and though since 1869 it has been possible for men to belong to the university without being members of a college, the class of non-collegiate students thus created has never been very large, most undergraduates being connected with a college. Unlike Oxford, certain older distinctions among these are still maintained at Cambridge. Four classes of students are recognized: fellow-commoners, youths of rank or fortune, with special privileges; scholars, chosen by examination, and generally receiving some financial aid, as well as certain privileges; pensioners, or ordinary undergraduates; and sizar, poor students, partly or wholly supported by the college. The great majority of men live in college, though many of those belonging to colleges, and all the non-collegiate students, live in lodgings in the town. There are three terms in the university year, the Michaelmas, or October term; the Lent, or winter term; and the Easter, or spring term. These nominally include 227 days, but actually average each about eight weeks of required residence, leaving long vacations, during which much of the actual work, or 'reading' as it is called, is done. The students are under the direct charge of the tutors, who maintain personal relations with each man under their charge and supervise his work, directing him in a way not known to the educational system in the United States with its large classes and entire or partial absence of personal relation between student and instructor.

The degree of B.A. may be conferred, after the required examinations have been passed, at the end of nine terms or three years of residence. The degree of M.A. is attainable four years later, not in course, but in consideration of the pursuit of literary or scientific work. The university confers also degrees in law, theology, medicine, music, and an advanced degree in science, all of these latter being dependent on the possession of the bachelor's degree. Certain honorary degrees are also conferred, notably that of Doctor of Laws (LL.D.).

There are no exact equivalents at either of the English universities for the course of study common in the United States. The system of education is based upon, and conditioned by, the examinations which a candidate for the degree of B.A. must take. These are three in number. The following, from the 1900-01 regulations, will give the best general idea of the system. The 'previous' examination consists of two parts, one of the Gospels (Greek), one Latin classic, one Greek classic, one translation of English into Latin, and a paper on Latin and Greek accidence and syntax, forming the first part. The second consists of Paley's *Evidences*, geometry, arithmetic, elementary algebra, and an English essay. Candidates for honors must take the additional subjects of mechanics, French, and German. The second or 'general' examination consists of two parts, the first including one Greek classic, one Latin classic, algebra, elementary statics, a translation of English into Latin prose; the second, the *Acts of the Apostles* (Greek), some portion of English history, an English essay on a subject connected with the history offered, elementary hydrostatics, and some play of Shakespeare or a portion of Milton's works. The spe-

cial or final examination may be taken in any one of the following subjects: theology, logic, political economy, law, history, chemistry, physics, geology, botany, zoölogy, physiology, mechanics, and applied science, music, modern languages, mathematics, or classics. For those men who are candidates for honors, special examinations, called triposes, are provided in mathematics, classics, moral sciences, natural sciences, law, history, theology, Oriental languages, mediæval and modern languages, and mechanical sciences. The successful candidates in the triposes are arranged in three classes, according to their standing, and have their names printed in the Calendar. In all save the mathematical tripos, these divisions are called simply first, second, and third class. The honor men in mathematics, however, are known as wranglers, senior optimes, and junior optimes, and the head of the first list, the best man of the year, is known as the senior wrangler.

Women are admitted to the examinations, and have their names appear in the Calendar, next to the tripos lists, with their rank attached, but are not allowed degrees.

For further information on the university there are a number of books available. The *History of the University of Cambridge*, by J. Bass Mullinger, in two volumes (Cambridge, 1873-84), covers, so far, only the period to 1625, but is the best as well as the fullest account up to that time. There is an excellent, though briefer, account of the university and colleges before 1500, in H. Rashdall, *Universities of Europe in the Middle Ages* (Oxford, 1895). Official information may be obtained from the Cambridge University Calendar, and from the announcements of lectures and such publications as are issued from time to time. Much incidental information may be obtained from Sir G. M. Humphrey's *Guide to Cambridge*.

See, also, the articles in the present work on UNIVERSITY; EDUCATION; NATIONAL EDUCATION, and on the various colleges under their names.

The colleges in the order of their foundation, with dates and founders, are as follows:

Peterhouse, or Saint Peter's College, 1284, by Hugh of Balsham. Clare, 1326, by Elizabeth, Countess of Clare. Pembroke, 1347, by Mary de Saint Paul, Countess of Pembroke. Gonville and Caius, 1348, by Edmund Gonville; refounded by William Bateman, 1353, and later by John Caius, 1558. Trinity Hall, 1350, by William Bateman, Bishop of Norwich. Corpus Christi, 1352, by Guilds of Corpus Christi and Virgin Mary. King's, 1441, by Henry VI. Queen's, 1448, by Margaret of Anjou; refounded, 1465, by Elizabeth Woodville. Saint Catharine's, 1473, by Robert Wodelarke. Jesus, 1496, by John Alcock, Bishop of Ely. Christ's, 1505, by Margaret of Richmond and Derby. Saint John the Evangelist, 1511, by Margaret of Richmond and Derby. Magdalene, 1519, by Thomas, Baron Audley of Walden. Trinity, 1546, by Henry VIII. Emmanuel, 1584, by Sir Walter Mildmay. Sidney Sussex, 1596, by Lady Frances Sidney, Countess Dowager of Sussex. Downing, 1800, by Sir George Downing.

Public Hostels.—Cavendish College, extinct, 1876-91. Selwyn College, 1882, by subscription. Ayerst Hall, extinct, 1884-96.

CAMBRIDGE PLATFORM. See CONGRESSIONALISTS.

CAMBRIDGE PLATONISTS. A school of writers in the English Church, members of the University of Cambridge, in the latter part of the Seventeenth Century, who sought to exhibit the entire rationality of the doctrines of the Christian religion, and drew largely from Plato in execution of this purpose. They were the liberals of their age, and were often styled 'Latitudinarians.' There had been a liberal party in the early part of the century, but its liberalism was concerned with Church polity. It sought to maintain a comprehensive Church. The liberalism of the Cambridge Platonists took another direction, for they sought to emphasize the great Christian doctrines to the neglect of minor matters, often made the instruments of sectarian exclusiveness, and to show that these great doctrines were identical with the teachings of the soundest philosophy. With a single exception (More, educated at Emmanuel College, and of the Puritan party), they worked in great harmony: while they naturally belonged to the party that had formulated the Puritan theology in the Westminster Confession, they were led, by the prevailing laxity of morals and the multiplication of sects, to endeavor to overcome the schism between divinity and morals. They were powerfully influenced by the philosophical currents of their time, particularly by the writings of Descartes (Cudworth and Keon), less so by those of Bacon. But as a school, they were formed by the study of Plato, and of the Christian Fathers who followed the Platonic course of thought—those of Alexandria. On the other hand, the school was largely determined by its fundamental antagonism to the doctrines of Hobbes, who founded his philosophy on the senses, and ignored the moral and religious postulates of human nature. Against this philosophy the Cambridge Platonists waged uncompromising and unceasing war. Their liberalism, however, brought them into suspicion, and they were generally regarded with disfavor.

The principal representatives of this school were the following:

Benjamin Whichcote, born in Shropshire, March 11, 1609-10, died at Easter, 1683, in Cambridge. His father was apparently a country squire, the owner of Whichcote Hall. He was sent to Emmanuel College in 1626, took his B.A. in 1629, and his M.A. in 1633, when he became fellow of his college. In 1636 he was ordained, in 1643 presented to the living of North Cadbury, where he probably married. He was made provost of King's College, Cambridge, in 1644, and continued to occupy this post till the Restoration, 1660, when he was displaced by the royal order. His great work here was performed as a teacher, and particularly as the preacher of the Sunday afternoon lecture in Trinity Church. In these sermons he sought to lift the plane of current religious thinking, and he exercised the great influence which belongs to those whom the sight of a receptive audience quickens to eloquence. After his removal he occupied two different charges in London, spending his last fifteen years in Saint Laurence Jewry, where he was attentively heard by a small but select congregation. He published nothing himself. After his death a few sheets of *Select Notions* were published in 1685, a *Treatise of Devotion* in 1697, then *Select Sermons* (1698) with a preface by the Earl of Shaftesbury (reprinted, Edin-

burgh, 1742); and in the years 1700 ff. a new edition of the sermons from the author's own MSS. in four volumes, with a volume of *Aphorisms* (1753).

John Smith, one of the most gifted of the school, born at Achurch, Northamptonshire, 1618, died August 7, 1652, has left behind almost no materials for a biography. He entered Emmanuel College, Cambridge, in 1636, took his B.A. in 1640, and his M.A. in 1644, at which time he was chosen fellow of Queen's College. His health seems to have been precarious from the first. His labors were principally confined to his office as teacher, for which he had remarkable qualifications. His preaching was with a rare degree of eloquence, which can still be felt in the *Discourses* (1660), which remain to us. He gained much local fame as a lecturer on mathematics. His personal character was such as to excite the admiration and love of his associates in a remarkable degree. As a founder of the school, his special service was in developing the foundations of a Christian philosophy.

The two most famous of the Cambridge Platonists are *Ralph Cudworth* and *Henry More*, whose lives will be found in their alphabetical places in this Encyclopedia. More obscure were *Nathaniel Culverwel*, of a genius and eloquence like Smith's, who entered Emmanuel in 1633 and took his M.A. in 1640, was a fellow and preacher in the College Chapel, died about 1651, and whose *Discourse of the Light of Nature* was published 1652; *John Worthington*, a native of Manchester, educated at Emmanuel College, Master of Jesus College till the Restoration, then held a succession of livings, and finally Hackney, where he was chosen lecturer in 1670, his *Discourses* being published in 1725, and *Miscellanies* in 1704; *George Rust*, fellow in Christ's College in 1657, after the Restoration in Ireland, where, in 1667, he became Bishop of Dromore, died in 1670, his *Discourse of Truth* appearing in 1682; *Simon Patrick* (1626-1707), Bishop of Chichester, 1680, and of Ely, 1691; *Edward Fowler*, took his M.A. in Trinity College, Cambridge, about 1655, finally Bishop of Gloucester; *Joseph Glauvill* and *John Norris*, both Oxford students, but impregnated with the spirit of the Cambridge Platonism. Consult John Tulloch, *Rational Theology and Christian Philosophy in England in the Seventeenth Century*, Vol. II. (Edinburgh, 1872).

CAMBRIDGESHIRE. An inland agricultural county of England (Map: England, G 4). Area, 820 square miles. About three-fourths of the county consists of arable land, meadow, and pasture, the rest being fens. The chief rivers are the Ouse, which crosses the middle of the county from west to east, with its tributary the Cam, the Nene, which borders the county on the north, and the Lark. These are all navigable to a certain extent. County town, Cambridge. Population, in 1891, 188,961; in 1901, 190,700. Consult Conybeare, *History of Cambridgeshire* (London, 1897).

CAMBRONNE, kân'brûn', PIERRE JACQUES ETIENNE, Count of (1770-1842). A brave and blunt soldier of Napoleon, most widely known, perhaps, for a phrase he never uttered. He was born at Saint-Sébastien, near Nantes, fought in the Vendée in 1792, distinguished himself at Zurich in 1799, and participated in the campaigns of the Empire between 1806 and 1813.

He went with Napoleon to Elba, and at Waterloo led a division of the Old Guard. There, after fighting like a madman, he is reported to have cried in answer to General Halkett's demand for his surrender, *La garde meurt et ne se rend pas* (The Guard dies, but never surrenders). Cambronne did not say this, however, and he did surrender. Severely wounded, he was taken to London, but bravely returned to stand his trial before a court martial, which acquitted him. In 1820 he was restored to his rank in the army.

CAM'BUSCAN'. The king of Tartary in Chaucer's *Squire's Tale*. The King of Arabia and India sends him a brazen horse, a mirror, a ring, and a sword of magic properties. He is the father of two sons, Algarsif and Camballo, and of a daughter, Canace. The story stops after a sort of prologue which promises adventures to come, more especially for Camballo and Canace; so the later history of Cambuscan and his presents is unknown.

CAMBYSES, kām-bī'sēz, I. (Gk. *Καμβύσης*, Old Pers. Inscr. *Kambūjiya*, of uncertain etymology). The father of Cyrus the Great (q.v.) and son and successor of Teispes in the line of Persian kings (Herod. vii. 11, and the Cyrus Cylinder).

CAMBYSES II. (? B.C. 522). King of the united realm of the Medes and Persians from B.C. 529 to 522. He was the grandson of Cambyzes I. and son of Cyrus the Great. Ascending the throne on the death of his father, he at once took the reins of government in his hands. His brother, Smerdis (Old Pers. *Bardiya*), was made viceroy of the eastern provinces of Iran. Cambyzes's first and chief design was the conquest of Egypt. He invaded this country with his armies, and in B.C. 525 defeated Psammenitus, the King of Egypt, at Pelusium. Memphis, the capital, fell in the following year, B.C. 524, and Cambyzes was soon master of the entire fertile valley of the Nile. Nubia was also subjugated, but not without great loss to his forces, and an attempt to conquer the Ethiopians proved a disastrous failure. An expedition likewise against Carthage had to be abandoned because the Phœnicians refused to lend their naval power. It was now that Cambyzes received news that the throne of Persia had been seized, during his absence, by a Magian priest Gaumata, the Pseudo-Smerdis. The usurper impersonated Bardiya, or Smerdis, Cambyzes's brother, who had been assassinated, though the people did not know it, at the instigation of Cambyzes himself. Startled by this bold impersonation of one whom he believed to be dead, the guilty and crime-laden Cambyzes hastened to retract his steps to Persia, but died on the way, B.C. 522, at Agbatana, which Herodotus (iii. 62-64) calls a city of Syria, but Josephus names Damascus. The oracle of Buto had prophesied he would die at Agbatana, but Cambyzes always supposed the Median Ecbatana to be meant by this. In certain respects, the accounts of Herodotus (iii. 64) and Ctesias differ as to the manner of his death, but both attribute it to an accidental self-inflicted wound. In the great Behistun inscription (i. 43) Darius says that Cambyzes died by a death self-inflicted, but the word *uvd-maršiyuš*, lit. 'self-death,' seems rather, though not necessarily, to imply suicide. Regarding the character

of Cambyzes, if we follow Herodotus, his behavior in Egypt was little short of that of a madman. His cruelties and sacrilegious acts were atrocious. He is said to have violated the tombs of the Egyptians, and even to have put some of their leading men to death. In an outrageous manner he stabbed the sacred bull of Apis so that it died, and he caused the ministering priests to be scourged (Hdt. iii. 29). But it must be added that this account is not easy to reconcile with an existing stele on which Cambyzes is portrayed as giving an honorable burial to the dead god Apis. On the whole, however, there can be no doubt that he was a dissolute and inhuman ruler. See CYRUS; DARIUS; MEDIA; PERSIA.

CAMBYSES, KING OF PERSIA. A tragedy by Thomas Preston, published in London in 1569 by John Alde. An undated edition was later brought out by Edward Alde. It has been reprinted by Hawkins and Dodsley. It is important as marking the transition between the morality and the historical drama. It is written in Alexandrine rhymes, occasionally dropping into heroics in the comedy passages. The melodramatic treatment of its subject is probably referred to by Shakespeare in his now proverbial expression of "speaking in King Cambyzes's vein."

CAM'DEN. A town and county-seat of Wilcox County, Ala., 62 miles west by south of Montgomery, on the Louisville and Nashville Railroad. It is in the fertile 'Black Belt' of Alabama. Population, in 1890, 545; in 1900, 478.

CAMDEN. A city and county-seat of Ouachita County, Ark., 115 miles south by west of Little Rock, on the Ouachita River, and on the Saint Louis Southwestern and the Saint Louis, Iron Mountain and Southern railroads (Map: Arkansas, C 4). It has a considerable river trade, shipping cotton, lumber, poultry, and live stock, and contains machine-shops, cotton-compress, cottonseed-oil mill, lumber-mills, and wagon-works. Population, in 1890, 2571; in 1900, 2840.

CAMDEN. A city, port of entry, and county-seat of Camden County, N. J., on the Delaware River, opposite Philadelphia, with which it is connected by several lines of steam ferries (Map: New Jersey, B 4). It is an important railroad centre, the terminus of the Atlantic City and the West Jersey and Seashore railroads, and of divisions of the Pennsylvania Railroad. The city, which occupies an area of about 8 square miles on level ground, has regular streets, one-third of the total street mileage (180 miles) being paved, and, among the more notable features, contains a city hall and county buildings, a hospital, the West Jersey Orphanage, and several other benevolent institutions, good public schools, including an institution for manual training. Camden is an important shipping point; it has large market gardens in the suburban districts adjacent, and is noted for its manufacturing and shipbuilding interests. The leading manufactures are machinery, foundry products, cotton and woolen goods, oilcloth, lumber, chemicals, paints, steel pens, boots and shoes, etc. The government is vested in a mayor, and a unicameral city council, with the customary staff of administrative officials. Camden spends annually

in maintenance and operation about \$735,000; the main items of expenditure being \$180,000 for schools, \$125,000 for interest on debt, \$100,000 for the police department, \$75,000 for the fire department, \$70,000 for municipal lighting, and \$70,000 for the water-works. The assessed valuation of property, real and personal, is about \$29,000,000, and the bonded debt \$2,500,000. The sewerage system comprises about 100 miles of mains, and the water-works, including two plants built by the city in 1870 and 1889, at a total cost of \$2,500,000, are under municipal operation, the system having 95 miles of mains. Population, in 1890, 58,313; in 1900, 75,935, including 10,100 persons of foreign birth and 5600 of negro descent. Camden, with a population of 1142, was chartered as a city in 1828; the Camden and Amboy Railroad, incorporated in 1833, gave the city its early importance as a railroad terminus. It was the home of Walt Whitman from 1873 until his death in 1892. Consult Fisler, *A Local History of Camden* (Camden, 1858).

CAMDEN. A town and county-seat of Kershaw County, S. C., 32 miles northeast of Columbia, on the Wateree River, which is navigable, and at the intersection of the Southern Railroad and Seaboard Air Line systems (Map: South Carolina, D 2). It is known as a winter resort, and has manufactures of cotton cloths and yarns, lumber-mills, and an extensive brick-making plant. Camden was settled in 1750 by a colony of Quakers from Ireland, and in 1791 was incorporated as a town. It is governed under a charter of 1890, which provides for a mayor, elected every two years, and a municipal council. Here, on August 16, 1780, an English force of 2000 under Lord Cornwallis defeated an American force of 3000 under General Gates, Baron DeKalb being mortally wounded in the engagement; and near here, at Hobkirk's Hill (see **HOBKIRK'S HILL, BATTLE OF**), an English force under General Rawdon repulsed an American force under General Greene on April 25, 1781. In 1825 a monument was erected to the memory of DeKalb, Lafayette laying the cornerstone. On February 25, 1865, General Sherman entered Camden and destroyed 2000 bales of cotton, a large quantity of tobacco, and a number of buildings. Population, in 1890, 3533; in 1900, 2441.

CAMDEN, CHARLES PRATT, first Earl of (1714-94). An English Chief Justice and Lord Chancellor, third son of Sir John Pratt, a Chief Justice under George I. He was born at Kensington and educated at Eton and Cambridge. In 1734 he became a fellow of his college, the next year obtained his B.A. degree, and in 1740 that of M.A. He studied law and was admitted to the bar in 1738. His prospects were discouraging until 1752, when he successfully defended a bookseller for libel on the House of Commons. In 1757 he was appointed Attorney-General, and in 1762 Chief Justice of the Common Pleas. He presided over the trial of Wilkes (q.v.) and declared the action of Government illegal, an opinion which, according with public sentiment, made him the most popular of judges. In 1765 he was created Baron Camden by the Rockingham administration, whose American policy and treatment of Wilkes, notwithstanding, he constantly opposed. The following year, although appointed Lord Chancellor, he did not

abandon his principles; and four years after supported an amendment made by Chatham on the Government address, and resigned his office. Henceforth he was a political character. He took an active part against the ill-advised American policy pursued by Lord North, and in discussions on the law of libel, was called 'the maintainer of English constitutional liberty.' During the Revolutionary War he was very popular in the United States, and his memory is perpetuated by many counties, towns, and villages named after him. He was president of the council under Rockingham in 1782-83 and under Pitt from 1783 until his death, April 18, 1794. He was created Earl Camden and Viscount Bayham in 1786.

CAMDEN, WILLIAM (1551-1623). An antiquarian and historian, surnamed 'The British Pausanias.' He was born in London, where his father was a house-painter, May 2, 1551. His education began at Christ's Hospital, was completed at Saint Paul's School and at Oxford, where he obtained a B.A. degree in 1573. In 1575 he was appointed second master of Westminster School, and while discharging the duties of this office he undertook the work which made his name famous. His *Britannia*, written in elegant Latin, and giving an account of the British Isles from the earliest ages, was first published in 1586, and it at once brought him into communication with the learned men of his time. Before 1607 the work had passed through six editions, being enlarged and improved by the industry of the author. At first a comparatively small volume, it received much additional matter from other writers. The best-known edition is that of Edmund Gibson, in English, 2 vols., folio (1722). The latest translation is that of Gough and Nichols (2d ed., 1806). Bishop Nicholson said of this work that it was "the common sun whereat our modern writers have all lighted their little torches." In 1593 Camden was appointed head master of Westminster School; and in 1597 Clarenceux King-at-Arms, an appointment which gave him more time for the pursuit of his favorite studies. His other important works are: *Annals of the Reign of Elizabeth* (latest ed., 1717); *A Collection of Ancient English Historians* (6th ed., 1607); *An Account of the Monuments and Inscriptions in Westminster Abbey* (1600); and *A Narrative of the Gunpowder Plot* (1607). He died November 9, 1623, at Chiselhurst, in the house which afterwards belonged to Napoleon III., and was buried in Westminster Abbey. Before his death he endowed a professorship of history at Oxford.

CAMDEN SOCIETY. An English association organized in London in 1838, and named in honor of William Camden. Its object is the publication of historical and literary remains of antiquarian and general interest. The publications began in 1847. After 104 volumes had been issued, a new series began, which up to 1900 includes an additional 63 volumes.

CAMEL (OF., Lat. *camelus*, Gk. κάμηλος, *kamēlos*, from Heb. *gāmāl*, camel). A large desert-dwelling ruminant of two species, constituting the typical genus, *Camelus*, of the family Camelidæ. Both have been subjugated to man since prehistoric times, and neither is known or remembered in a wild state. The free camels which now roam in northern Turkestan, where they are hunted for their flesh, hides, and supe-

CAMELS AND LLAMAS

1. VICUNA (*Lama vicunia*).
 2. GUANACO (*Lama guanacus*).
 3. ALPACA (*Lama pacos*).

4. LLAMA (*Lama glama*).
 5. ARABIAN CAMEL, Dromedary type.
 6. BACTRIAN OR TWO-HUMPED CAMEL.

rior wool, are descendants of the few which survived the vast sand-storms which, about 1700, overwhelmed the villages on the Gobi plateau and killed all the people. The two species of camel are the true or Arabian camel (*Camelus dromedarius*), having one hump, and the Bactrian camel (*Camelus Bactrianus*), with two humps. These humps are stores of flesh and fat, reabsorbed in support of the animal when overtaken by famine, as is so likely to happen.

The former is the common and widespread species, found from northwestern India and the lowlands of Afghanistan down to the extremity of Arabia east of the Red Sea and Somaliland to the south, and westward as far as the African deserts extend. They have also been introduced into Australia, Spain, Zanzibar, and the southwestern United States, but without permanent economic success. The United States Government spent much money and pains to acclimatize them as an army transport service in the dry southwestern regions, about 1857; the Civil War interrupted the arrangements, but the attempts made by private hands to utilize the animals were not profitable. Many were turned loose and remained wild along the Mexican border, but multiplied very little, and they are now supposed to be extinct. The British Government has made extensive use of them in its military operations in India and Upper Egypt, both as baggage animals, and in hauling artillery, and as mounts for a division of 'cavalry' known as the 'camel corps.' Consult Gleichen, *With the Camel Corps Up the Nile*, London, 1888, wherein many interesting facts as to the habits and qualifications of the animal are given.

What country was the original home of this species is uncertain; it seems more thoroughly adapted to a sandy region than the Bactrian, and is presumed to have had a more southerly habitat than the latter, probably inhabiting Arabia and perhaps the Sahara when first enslaved by primitive men. It is singularly adapted to subsistence in the desert by the structural qualities elsewhere mentioned (see CAMELIDÆ), and by its ability to bite off and consume the tough shrubbery and even thorny plants which alone grow there, and to endure the burning heat and flying sand. To this end it has acquired not only the thick and broad sole-pads, but the thick callosities on the joints of the legs and on the chest upon which it rests (in a kneeling posture) when it lies down; moreover, the nostrils may be closed against the flying dust, and the eyes are shaded and shielded by very long eyelashes. Its extremely acute sense of smell, especially for water, is another life-saving provision. All these qualities have combined to render it so highly serviceable to man in the great wastes that separate the habitable regions south and east of the Mediterranean, Black, and Caspian seas, that it is safe to say these could never have been colonized and have been the scenes of the momentous incidents and impulses they have contributed to civilization had it not been for the assistance of this ungainly and unlovely creature. "I can speak from experience," remarks Captain Wellby (*Twist Sirdar and Menelik*, New York, 1901), "of this marvelous endurance of camels, for on a previous trip in Somaliland I once marched with a string of camels for eleven days, during which time none of them had a drop [of water]."

The Bactrian camel is better adapted, by its smaller size and heavier build, harder and more cloven feet, longer and finer wool, and other qualities, to a rocky and cooler region, and its home is central Asia, from northern Turkestan to Mongolia. Its endurance is equally remarkable, under different circumstances, with that of its southern congener, for it withstands the awful climate of the Tibetan plateau, where the temperature rises to 140° F. in summer and sinks to Arctic cold in winter; it tramps with burdens of tea or hauling wagons or sledges over the plains, and often through wintry snows, from Peking to Lake Baikal, and carries heavy loads over the lofty passes of the Hindu Kush, and across the flinty plains of Afghanistan, and thence to Persia. It is this ability to endure climatic extremes, variety of fare, and famine, which has perpetuated the camel through a longer generic history than that of almost any other animal, and has made it of so much service to mankind in regions unendurable by most cattle or horses.

The Arabian camel carries twice the load of a mule. The Bactrian camel is sometimes loaded with 1000 or even 1500 pounds weight, although not generally with so much. A caravan sometimes contains 1000, sometimes even 4000 or 5000 camels. The supply of food carried with the caravan for the use of the camels is very scanty; a few beans, dates, carob-pods, or the like, are all that they receive after a long day's march, when there is no herbage on which they may browse. The pace of the loaded camel is steady and uniform, but slow—about 2½ miles per hour. Some of the slight dromedaries, however, can carry a rider more than 100 miles in a day. The motion of the camel is peculiar, jolting the rider in a manner extremely disagreeable to those who are unaccustomed to it; both the feet on the same side being successively raised, so that one side is thrown forward, and then the other.

The patience of the camel has been celebrated by some authors, but this is mainly indifference and stupidity. It submits because it knows no better, cares nothing for its master, is influenced to a very slight degree by either kindness or harshness, is unhappy when alone, and always untrustworthy; is cowardly, and, at the rutting season, is subject to sudden and violent fits of rage, when it uses its teeth with terrible effect.

The camel produces only one young one at a time, or rarely two. It lives thirty or forty years. During the long ages it has been subjected (the word 'domesticated' hardly applies) to man, almost as many breeds have been created as in the case of the rose, and there is a vast difference between those bred as baggage animals and those reared for the saddle; the latter, light and swift, often capable of traversing 100 miles of desert a day, are 'dromedaries,' whether one-humped or two-humped.

The great value of the camel to the desert people is due to its manifold usefulness, for besides its utility as a carrier of both man and his burden, and as a means of trade, its flesh is good food, and the milk is excellent; from the hair, cloth, ropes, etc., are made; the hide is serviceable; the bones (in eastern Asia) serve as ivory; and the dung is in some regions almost the sole dependence of the nomads for fuel. The animal is nevertheless steadily decreasing in im-

portance by the advance of railways, the opening of wagon roads, and other supersessions of its service, even in the remoter parts of its arid domain. See Plate of CAMELS and LLAMAS.

CAMEL (from *camel*, as carrying heavy burdens). A water-tight, box-like contrivance designed for lifting ships, sunken weights, etc. The use of wooden floats for lightening the draught of a ship to permit her to pass over a shoal or bar is very old, but the invention of hollow floats, or camels, is ascribed to the Dutch, and their first use is said to have been about 1688. The ordinary camel is a simple rectangular box float, and is much used in navy-yards and private ship-building establishments. The camels designed by the Dutch were sometimes a hundred feet or more in length, 20 feet broad, and made to fit the sides of the ship; they were allowed to fill with water, hauled up close to the vessel's sides, and secured in place by chains and lashings. When the ship reached the shoal or bar the water was pumped out of the camels, and the increased buoyancy thus obtained raised the ship enough to materially decrease her draught. Modern camels which are used in wreck-raising are generally built of steel and fitted with machinery for working the chains which support the wreck or attach it to the camel.

CAMEL-BIRD. The ostrich; a book-name.

CAMEL CRICKET, or **CAMEL LOCUST.** A mantis (q.v.).

CAMELIDÆ (Neo-Lat., from Gk. *κάμηλος*, *kamēlos*, camel). The camel family, constituting

a section of the ruminants termed Tylopoda, in reference to the character of the feet. This family is composed of two genera—*Camelus*, with

SKULLS OF CAMELS.

1. *Poebrotherium*, an extinct primitive type. 2. Existing camel, showing change in dentition.

two species (see **CAMEL**), and *Llama*, the American llamas, considered by some naturalists one species, by others four. (See **LLAMA**.) These animals agree in peculiarities of structure, which separate them from other ruminants, mainly as follows: Though a full set of incisor teeth are present in the young, only the outermost continue through life as isolated lanianiform teeth; canines are present in both jaws, and the molars are solenodont in type. The skeleton has many peculiarities, of which a striking one is the excessive comparative length of the thigh-bone, and the detachment of the hind leg from the body. The limbs are long, the ankle-bones peculiar, and all traces of phalanges are lost, except the third and fourth. These are not incased in matched hoofs, like other artiodactyls, but the foot consists of two elongated toes, each tipped with a small, nail-like hoof, the feet resting not upon the hoofs, but upon elastic pads or cushions under the toes. In the camels the toes are united by a common sole, thus resting upon one extended pad, instead of having each a separate one, as in the llama group, the broader expanse of the foot enabling the animals of the one genus more easily to traverse the loose sand of the desert, while the narrow

6. CANNAS OR INDIAN SHOT (*Canna indica* var.).

form and separation of the toes in the other is suited to the uneven surface of rocky heights. The head is long, without any horns or antlers, the lips extended and mobile, the neck of unusual length; the blood-corpuscles are oval instead of circular, as in all other mammals, and the digestive organs are characterized by a remarkable peculiarity in the structure of the stomach. "Though these animals ruminate," to quote Flower and Lydekker, "The . . . interior of the rumen or paunch (see RUMINANT) has no villi on its surface, and there is no distinct psalterium or manyplies. Both the first and second compartments are remarkable for the presence of a number of pouches or cells in their walls, with muscular septa, and a sphincter-like arrangement of their orifices, by which they can be shut off from the rest of the cavity, and into which the fluid portion only of the contents of the stomach is allowed to enter." Such is the celebrated arrangement by which the camel stores in its stomach more water than it can immediately use, and by gradually using it is able to make far longer journeys across arid regions than otherwise would be possible. This has customarily been regarded as a very striking special provision for the needs of the camel of the desert; but it is equally characteristic of the llamas, which inhabit well-watered regions, and has evidently descended to both from a remote common ancestry, regardless of present environments. See ALIMENTARY SYSTEM.

The structural evolution of the camel recalls that of the horse. (See EQUIDÆ.) In the oldest Tertiary rocks of the ancient lake region of the Rocky Mountains, at the dawn of the Eocene, have been found diminutive remains suggesting this type, and in the Upper Eocene fossil skeletons undoubtedly cameloid. These belong to an animal (Prototylops) hardly larger than a jack-rabbit, yet camel-like in many particulars. It had four distinct toes, of which the third and fourth were most useful, while the lateral second and fifth were smaller; the metapodial bones were disconnected, and there was no space between the bunodont molars and the front teeth, where the canines and incisors were alike. By changes that went on analogous to those in other ungulates, there is found in subsequent cameloid forms increase in size, and a constant tendency toward acquiring the dentition and pedal anatomy characterizing modern forms. The next advanced form is greater in size, and the lateral toes, no longer useful, hang to the side of the foot above the ground like a deer's. A steady increase of size goes through the ascending formations of the Miocene, until we reach Procamelus, at the top of the Miocene (Loup Fork beds of Wyoming), which was as big as a sheep and very llama-like, with teeth nearly of modern type and the metapodial bones firmly united when fully adult. During the Miocene the western American plateau seems to have been an arid desert, and under such conditions were developed the large, splayed feet, bereft of the useless side toes, the great sole-pads, and the pouched stomach that characterize the race. At the close of the Miocene, however, there came about a steady change toward a warmer, moister climate, inducing forest growth, which put an end to camel life in North America. Meanwhile they had migrated into South America, where fossil remains of great size are

found, and where the family still survives, in the modified and perhaps degenerate forms of the llamas; and also northwestward to Siberia, and thence into Central Asia, where their remains are found in the Pliocene rocks of India, but not earlier. Here the conditions were favorable, and the modern camels seem to have developed. It thus appears that North America was the original home of the Camelidæ, and that they "were derived from pig-like animals quite independently of the true ruminants." For particulars as to American fossil camels, consult Wortman, *Bulletin American Museum Natural History*. X. (New York, 1898).

CAMELINA (Neo-Lat., probably from Gk. *χάμηλ, chamai*, on the ground + *λίνον, linon*, flax). A genus of cruciferous plants embracing about a dozen species, most of which are European. *Camelina sativa* is cultivated in Europe and Asia for the oil contained in the seed. The stalks contain a kind of fibre, which is sometimes used for making brooms. The plant has become introduced into the United States, where it is known as false flax, or gold of pleasure, and is considered a bad weed. See GOLD OF PLEASURE.

CAMELLIA (Neo-Lat., named after Joseph Kamel, a Moravian traveler of the Seventeenth Century, who first described the *Camellia japonica*). A genus of plants of the natural order Ternstroemiaceæ, nearly hardy evergreen shrubs or trees, and natives of China, Japan, and the north of India. Camellias are now extensively cultivated as greenhouse shrubs in Europe and in the United States. Many varieties are in cultivation. The best known and most esteemed is *Camellia japonica*, a greenhouse shrub. Its leaves are ovate-elliptical, almost acuminate and serrate shining; the flowers are without stalks, mostly solitary, large, and rose-like. It is a native of Japan, and there and in China it has been carefully cultivated from time immemorial. In its wild state it has red flowers, and the red single camellia is much used by gardeners as a stock on which to graft the fine varieties, the flowers of which are generally double. The colors of the cultivated forms are various, including red, white, and yellow, and the varieties also differ much in the form and position of the petals. The flowering time is in autumn, winter, and spring. Camellias grow best in cool houses. Free access of air is of great importance, and water must be given very liberally, yet with such caution that the soil may never remain soaked after the immediate wants of the plant are supplied. The proper soil for camellias is a loose black mold; a little sand and peat are often advantageously mixed with loam to form it. Camellias are often propagated by cuttings, or layers, but generally by grafting or inarching. The single camellia is also propagated by seed, and in this way the best stocks for grafting are procured. Of the other species of camellia, the most hardy, and one of the most beautiful, is *Camellia reticulata*. The seeds of certain varieties, as *Camellia oleifera* and *drupifera*, are used in China for the production of an olive-like oil. The true tea-plant is a close ally of the camellia. See TEA.

CAMELOPARD. See GIRAFFE.

CAMELOPARDALIS (Gk. *καμηλοπάρδαλις, kamēlopardalis*, giraffe, literally camel-pard, from

κάμηλος, *kamēlos*, camel + πάρδαλις, *pardalis*, pard). A constellation defined by Hevelius, between the pole-star, Auriga, Cassiopeia, and the head of Ursa Major, which consists of stars of moderate magnitudes, forming, in imagination, the shape of a giraffe.

CAMELOT, or **CALBURY**, *kal'bēr-l*. A steep hill in the parish of Queen's Camel, Somersetshire, England, 5 miles from Ilchester (Map: England, D 5), identified by tradition with Camelot, one of the capitals of the legendary King Arthur (q.v.). Others state that Camelot was the name given in the mediæval romances to the city which grew up out of the permanent quarters of the second Augustan legion at Caerleon-upon-Usk.

CAMELOT. The legendary site of King Arthur's castle and court. It has been variously located in Somersetshire, at or near Winchester, Hampshire, and in Wales. Shakespeare favored the first, Tennyson and Capell the second, and Caxton the third site. The monks of Glastonbury were chiefly responsible for the 'Somerset' theory, which they maintained, especially in the Fourteenth Century, for the purpose of attracting pilgrims and thus enriching their abbey. It is often mentioned in English literature, notably in *King Lear* and *The Lady of Shalott*.

CAMEL'S HAIR. A fabric woven from the hair or wool of the camel, by Persians and Arabs, for tents and clothing. In early ages rough garments of this stuff were worn by monks and priests by way of penance. It is now imported into Europe and used extensively in the manufacture of dress materials, whose chief characteristic is a rough and hairy surface. Cow's hair is sometimes used as a substitute in the cheaper grades of so-called camel's-hair goods. A fine grade of camel's hair is used for artists' brushes.

CAMEN, *kā'men*, or **KAMEN**. A town in the Province of Westphalia, Germany, on the Seeseke, 10 miles southwest of Hamm. It is a thriving industrial centre, with coal-mines, paper-mills, and iron-foundries. Population, in 1900, 9888.

CAMENÆ (Lat., Old Lat. *casmenæ*, muses, prophetesses, connected with *carmen*, song). In Roman mythology, nymphs possessing the power of prophecy, as Carnenta and Egeria. They had a sacred grove in Rome, just outside the Porta Capena. (See *EGERIA*.) The Roman poets often apply the name *Camenæ* to the nine Muses of Grecian myth.

CAMENZ, *kā'mēnts*. See **KAMENZ**.

CAMEO (It. *cammeo*, Fr. *camée*, Med. Lat. *cammaeus*). Gems cut in relief are called cameos, in opposition to those that are hollowed out so as to yield a raised impression, which are called *intaglios*. The term cameo, however, is applied more especially to those diminutive pieces of sculpture which are prepared from precious stones having two strata or layers of different colors, the undermost of which is left to form the background, the object to be represented being cut in the upper one. The stone generally used for this purpose by the ancients was the variegated sardonyx.

True cameos were probably not made before the Third Century B.C., though in very early times we find the backs of seals decorated with

figures in relief, so especially in the *scarabei*, seals decorated on the back with the sacred beetle of Egypt. As precious stones were used in the Orient and among the Greeks after the conquests of Alexander for many decorative purposes, the Greek artistic sense sought to raise this decoration to a higher plane, and this seems to have led to the carving of the gems into reliefs. At this period cameos were very extensively used, not only as personal ornaments, but in cups, vases, candelabra, and other objects of domestic luxury. Pateræ and other vessels were frequently worked out of a single stone, upon which were exhibited a whole series of figures of the most exquisite workmanship. Many of the antique cameos which have been preserved are wonderfully beautiful, both in design and execution. Of the Alexandrian cameos, probably the finest is the "Tazza Farnese," a shallow dish cut from a single sardonyx, and now in Naples. Other very fine specimens of the early period are the Gonzaga cameo in Saint Petersburg and a companion in Vienna, containing the portraits in profile of a man and a woman. They are commonly said to be portraits of Ptolemy II. and his Queen, Arsinoë, but are quite as probably Alexander the Great and Olympias (so Furtwängler). Of cameos of the Roman time, many fine specimens are to be found in the Continental museums. Especially noteworthy are the Gemma Augustea in Vienna, and the large sardonyx in Paris; both show Roman emperors, Augustus and Tiberius, triumphing over barbarians. Very celebrated is the "Cupid and Psyche" formerly in the Marlborough collection, now in the Boston Museum of Fine Arts, by Tryphon, who is supposed to have lived in the time of Augustus. The stones on which many of these cameos are cut are of surprising, and, in modern times, unequaled size and perfection. Cameos do not seem to have been made in mediæval times; but the art revived in Italy, under the auspices of the Medici, and the production of cameos, both in *pietra dura* and in shell, has there become a branch of art manufacture of considerable importance. Impressions from antique cameos in glass, sulphur, porcelain, and other materials are produced in many places, and, for artistic purposes, possess all the value of the originals.

The manufacture of cameos from artificial substances was not unknown to the ancients. One of the most beautiful specimens of an imitation of cameo in glass is the famous Barberini or Portland vase, now in the British Museum. The ground is blue, the figures, which are in low relief, being of a delicate, half-transparent white. (See **PORTLAND VASE**.) Another example is a vase in Naples, representing Cupids in a vineyard. Many fragments of the same kind of manufacture exist in other cabinets. See: C. Davenport, *Cameos* (London, 1900); and especially Furtwängler, *Die antiken Gemmen* (Leipzig and Berlin, 1900).

A shell cameo is a cutting in relief on a precious stone or a shell. It is opposed in meaning to intaglio, which signifies a cutting into the stone or shell. In intaglio work, furthermore, only gems of a uniform color are used, while in cameo engraving or cutting it is desirable to choose such stones or shells as possess layers of varying colors, such as onyx, agate, or tropical sea-shells. These differing tints are

skillfully utilized by intelligent engravers, so that at different depths of the cutting very beautiful and effective gradations of color are obtained. Shell, perhaps, gives the most delicate results, owing to the nearness of the color to that of flesh, and the general use made of the human figure and head as subjects for cameo engraving. The art is one of great antiquity, and the engraving of precious stones and of shells in distinct bands of color has been practiced since about B.C. 150. Probably stone and shell, more or less engraved as ornament, talisman, and seal, are of still more remote times.

Inasmuch as Egypt was the birthplace, as it were, of belief in amulets, charms, and phylacteries of all kinds, it naturally came to pass that it was the earliest country to develop and to encourage the production of these emblems which, for the individual, possessed a magical and religious significance. From the time of the dynasties of the first Pharaohs to the period of the domination of the Romans, the inhabitants of the valley of the Nile, men and women, all wore about the neck, on the finger, or hung somewhere on their garments, cut or engraved gems of a talismanic character, which also served, in some sort, as a personal seal. It is safe to say that no country of ancient times has produced in such profusion precious stones in relief and in intaglio. It was in the Greek and Roman period that the cameo reached its perfection. The century of Scopas, Praxiteles, Lysippus, and Apelles produced an artist in gems whom all antiquity praises, but from whom there has not come down to us a single signed work. This artist is Pyrgoteles. Pliny and many others speak of him as the ablest engraver of all time, and place him in the same rank as the above-mentioned sculptors and painters. Pyrgoteles probably engraved several portraits of Alexander in cameo and intaglio, though none can be authenticated. Although cameo is sculpture in miniature, we see by this that it engaged the talents of really great artists, and became, indeed, at its best, one of the fine arts. Among the largest examples of ancient cameo work is the Sainte Chapelle agate in Paris (13 x 11 inches), representing the apotheosis of Augustus, and the Vienna onyx, an allegorical representation of the coronation of Augustus. These surpass, in size and beauty of execution, the best of modern productions in this art.

CAMERA LUCIDA (Lat., light chamber).

A device fitted to the eyepiece of a compound microscope to enable the observer to trace upon a sheet of paper the magnified image of the object as seen. It is constructed in various forms, the simplest of which is a small plate of glass attached to the eyepiece at an angle of 45 degrees, as shown in Fig. 1. A portion of a slide or cover glass fixed to the eyepiece with wax can be employed for this purpose. In using the camera lucida, the tube of the microscope is placed in a nearly horizontal position, and a sheet of paper laid on the table beneath the eyepiece.

The rays coming through the eyepiece are reflected into the eye from the glass, though coming apparently from the paper below, where an enlarged image of the object is seen. The out-

FIG. 1. SIMPLE CAMERA LUCIDA.

line of the image can readily be traced with a pencil, and in this way an accurate representation of the object can be quickly made. Instead of the simple mirror of glass, Sömmering employed a flat, circular piece of polished steel or speculum metal, whose diameter was somewhat smaller than that of the pupil of the eye. The rays are reflected vertically, and enter the eye, as do also those from the paper which come to the eye, after passing by the edges of the mirror. A prism, so constructed that total reflection occurs one or more times, is often employed, and the arrangement of Wollaston, which is frequently used, is illustrated in the figures and described below. It consists of a small quadrilateral prism of glass, which Fig. 2 shows in

FIG. 2. WOLLASTON'S CAMERA LUCIDA.

perpendicular section, held in a brass frame, which is fitted in front of the eyepiece by a suitable mounting, or attached to an upright rod, having at its lower end a screw-clamp, to fix it to the edge of a table. The prism, being at the height of about a foot from the table, has its upper face horizontal. Two of its faces, as in

the figure, are at right angles; the contiguous faces make respectively with them angles of $67\frac{1}{2}^\circ$, so that the remaining obtuse angle contains 135° . Rays coming from an object and falling nearly perpendicularly on the first surface enter the prism, and undergo total reflection at the contiguous surface; they then fall at the same angle on the next surface, and are totally reflected again; finally, they emerge nearly perpendicular to the remaining surface. An eye, as in the figure, then receives the emergent pencil through one part of the pupil, so that an image of the object is seen projected upon a sheet of paper upon the table. The rays from the paper and pencil passing the edge of the prism enter the other part of the pupil; and the pencil and image being seen together upon the paper, a sketch of the latter can be made. There is, however, a practical difficulty—the image and the drawing-pencil are at distances sensibly different from the eye, and so cannot be seen together distinctly at the same time. To obviate this, a plate of metal, with a small aperture, as an eye-hole, is placed at the edge under the eye, so that the rays through the prism, and those from the drawing-pencil, which both pass through the eye-hole, form only very small pencils. A convex lens is also sometimes employed for this purpose. The form of camera lucida devised by Abbe is also used with the microscope. It consists of two right-angle prisms with their hypotenusal faces placed together and a reflecting

FIG. 3. ABBE'S CAMERA LUCIDA.

mirror, as shown in Fig. 3. The separating surface, *ad*, is formed by a thin film of silver, except a circular space at *bc*, through which the direct rays from the microscope pass, as indicated by the arrow OM. To an eye placed at O, the rays from the paper are reflected by the mirror *Sp*, and again at the silver film between the prisms, so that the image of the magnified object appears on the paper. This arrangement is so mounted that it can readily be moved to and from the eyepiece. By using a finely divided glass scale as an object, we may obtain projected on the paper a magnified image of the divisions, so that the width of the intervening spaces can be measured. A ratio between the scale division, unmagnified and as they appear on the paper at a distance of 10 inches from the eye, will give the magnifying power of the microscope. Consult Carpenter, *The Microscope and its Reve-*

lations, 8th ed., edited by Dallinger (Philadelphia, 1901).

CAMERA OBSCURA (Lat., dark chamber). A light-tight box, with a convex lens at one end and a screen at the other, on which an image is produced. This screen is generally a piece of

FIG. 1. CAMERA OBSCURA.

ground glass, or translucent paper, so that the image may be viewed from behind. The rays of light coming from an object pass through the lens, and when they reach the screen form an image which can be received on a sensitive plate and preserved in the form of a negative. If the screen is placed at the appropriate focal distance, a sharp representation of an object can be obtained. The human eye is a simple form of camera obscura, the crystalline lens and retina occupying the relative positions of lens and screen. The lens is not essential for the formation of an image, as with a small opening a picture is also produced. Such an image, while free from distortion, is not apt to be sharp, and a long exposure in making a negative is required.

The invention of the camera obscura is of importance on account of its being the prototype of the modern photographic camera, and is claimed for a number of celebrated men. The first of these is Roger Bacon, who lived in the Thirteenth Century, and after him comes Alberti, about two centuries later. Leonardo da Vinci, the famous painter and scientist, about the beginning of the Sixteenth Century, says that if you place yourself in an hermetically closed room, facing a building, landscape, or any other object directly lighted by the sun, and then cut

a small circular hole in the shutter, images of the objects outside will be thrown on any surface facing the hole, and will be reversed. Such was the condition of the camera until the time of Cardan, about the middle of the Sixteenth Century, when he improved it by the addition of a convex lens at the aperture. The instrument in this form is described in his work *De Subtilitate*. In 1569 Giambattista della Porta, of Naples, to whom the invention is generally ascribed, in the seventh book of his work on *Natural Magic*, gives a detailed description of the apparatus, and in his instrument he placed an inclined mirror before the lens, with the result that the pictures were rendered brighter and erect, instead of inverted. Porta's camera obscura attracted general attention, and the instrument was soon provided for the country houses of the wealthy, being placed usually in a small conical building, with a white table or surface in the centre, on which the pictures were projected. A more modern form is shown in Fig. 1.

The camera obscura in the form of a box, with inclined mirror and a piece of ground glass or paper on which the images could be traced, was invented by Hooke in 1679. This instrument has since become familiar in the form of an optical toy, shown in diagram in Fig. 2,

FIG. 2. CAMERA OBSCURA.

though the same principle has been made use of in certain pieces of scientific apparatus. The camera obscura in its simple form of lens and screen, suitably incased, was first used for photographic work by Humphry Davy in 1802, at a time when he was engaged in experiments with Wedgwood. After this, the camera obscura was used by all the early experimenters in photography (q.v.), and the instrument has since been developed and amplified to a remarkable degree. The photographic camera is con-

FIG. 3. SIMPLE PHOTOGRAPHIC CAMERA.

structed in an almost infinite variety of styles, depending in the main on the purpose for which it is to be used. In general, it consists of two boxes, joined by a flexible and light-proof material, such as a bellows of leather, rubber, or cloth, and susceptible of being moved toward or from each other, so that the distance between the lens and focal plane or position where

the image is received can be varied. In one of these boxes, or on an upright board taking its place, the lens is mounted, and on the other there is a frame carrying a piece of ground glass, which, at the time of taking the picture, is removed and the sensitive plate or film substituted. This is contained in a holder so constructed that the sensitive surface occupies the same position as the original focusing glass.

The construction of a camera varies with the use or process for which it is intended. Thus, for out-of-door work portability and rapidity of adjustment are essential, whereas in a studio or laboratory rigidity and adaptability are demanded. A view camera does not require any considerable length of bed, or base, as the ground glass is never distant from the lens a much greater amount than the principal focus (q.v.), as the pictures are generally on a reduced scale. If a camera, however, is designed for copying or enlarging, then it must have a long bed, as the distance from the lens to the ground glass will be as many times greater than the distance between the original object and the lens as it is desired to enlarge the picture. Frequently in the case of hand-cameras the ground glass is omitted, and the proper focus is obtained by reference to a graduated scale on the bed, on which are marked the foci corresponding to different distances.

The use of films and increased ease of manipulation has made photography universally popular, and there are almost as many styles of cameras as there are individual tastes. See article PHOTOGRAPHY.

CAMERARIUS, JOACHIM (1500-74). A distinguished German classicist, born at Bamberg, April 12, 1500, of a family which originally bore the name Liebhard; for this Camerarius (Ger. *Kammermeister*) was substituted, since the office of chamberlain to the Prince-Bishop of Bamberg was hereditary in the family. At the age of thirteen, Camerarius entered the University of Leipzig, where the influence of Georg Held, with whom he was on intimate terms, led him to devote himself to the classics. He eventually was second only to Melanchthon (q.v.) in arousing an interest in classical study in Germany. In 1518 he began to teach Greek at Erfurt, but in 1521 he moved to Wittenberg, where he attached himself to Melanchthon. At the latter's recommendation, he was appointed to teach Greek and history in Nuremberg in 1526. Nine years later he was called to the University of Tübingen as professor of the Greek and Latin literatures. In 1541 he went to Leipzig, where he continued to lecture until his death, April 17, 1574. He contributed to the eminence of this university, not only by his teaching and writing, but also by the practical measures of university reform which he, with certain associates, was able to carry through. He was especially distinguished for his critical judgment, in which he surpassed Melanchthon, while his knowledge of the classics was not inferior to that of his friend, so that he deserves to be regarded as the greatest German classicist of his century. His works were very numerous. Besides biographical and theological writings, the most important are the following editions: *Homeric Poems*, with the so-called scholia of Didymus (Basel, 1541); *Greek Elegiac Poets* (Basel, 1550); *Theocritus*

(Frankfurt, 1545); *Sophocles* (Basel, 1556); *Herodotus* (Basel, 1540 and 1557); *Thucydides*, with the scholia (Basel, 1540 and 1557); *Theophrastus* (Basel, 1541). He was also co-editor of the edition of *Galen*, published by Cratander (Basel, 1538, et seq.). After Camerarius's death, a number of Greek works and Latin translations were published by his relatives. Among the Latin authors edited by him should be named Quintilian with Commentary; Cicero (Basel, 1540); many separate works between 1542-1558; above all his edition of Plautus (Basel, 1552), for which he employed the so-called *Codez Vetus Camerarii* and the *Codez Decurtatus*, and thus for the first time secured a certain basis for the text. A full list of his works may be found in Pökel, *Philologisches Schriftstellerlexikon* (Leipzig, 1882). Consult Bursian, *Geschichte der klassischen Philologie in Deutschland* (Munich, 1883, pp. 185-90).

CAMERARIUS, RUDOLF JAKOB (1665-1721). A German botanist and physician, professor of medicine and director of the botanic garden at Tübingen. He was the first to recognize sexual differences in plants (1694).

CAMERINO, *ká'má-ré'nó* (Lat. *Camerinum*). A city in central Italy, with a bishopric dating from 252 and an archbishopric dating from 1787, between the Chienti and the Potenza, about 70 miles southwest of Ancona (Map: Italy, G 4). The cathedral, built in 1832, occupies the site of a temple of Jupiter. The town possesses a university, founded in 1727 (the smallest in Italy), and a library of 40,000 volumes. There are also the archiepiscopal palace, the ducal palace, the new palace, and a bronze statue of Sixtus V., erected in 1587. The chief industry is silk-growing. Population, in 1881, 12,000; in 1901, 12,542.

CAM'ERLEN'GO, or **CAM'ERLIN'GO** (It., chamberlain). The officer, generally a cardinal, who controls the finances and the secular interests of the Pope. During a vacancy in the Holy See, he is sole head in things temporal, and presides over the apostolic chamber or palace. In things spiritual, however, he is assisted by the other cardinals.

CAM'ERON, ARCHIBALD (c.1771-1836). An American clergyman, born in Scotland. He studied at Transylvania Seminary (later University), Lexington, Ky., was licensed to preach in 1795, ordained in 1796, and in the latter year was installed over the churches of Akron, Fox Run, and Big Spring. For many years the only Presbyterian clergyman in a wide extent of territory, he was occupied with itinerant labors until 1828, from which time he was pastor of the churches at Shelbyville and Mulberry. With the Rev. David Rice, he was a pioneer in the organization of the Presbyterian Church in Kentucky. Among his publications are: *The Faithful Steward* (1806); *An Appeal to the Scriptures* (1811); *A Defence of the Doctrines of Grace* (1816); and *A Reply to Some Arminian Questions on Divine Predestination* (1822).

CAMERON, Sir CHARLES (1841—). A Scotch journalist and politician, born in Dublin. He studied at Madras College, Saint Andrews, and Trinity College, Dublin, and at the medical schools of Paris, Berlin, and Vienna, and from 1864 to 1874 edited the *North British Daily Mail*. From 1874 to 1885 he was member of

Parliament for Glasgow, from the subdivision of the constituency in 1885 until 1895 sat for the College division, and in 1897 was elected for the Bridgeton division. He introduced into the House the resolutions whose carriage effected the introduction of sixpenny telegrams, the previous minimum charge having been a shilling. He has published monographs on political and other subjects.

CAMERON, Sir CHARLES ALEXANDER (1830—). An Irish physician and chemist. He was born in Dublin, and was educated in Dublin and Guernsey and in Germany. In 1862 he became public analyst for the city of Dublin, and in 1867 was appointed professor of hygiene and chemistry in the Royal College of Surgeons in Ireland. The following are a few of his valuable publications: *Elements of Agricultural Chemistry* (in collaboration with J. S. W. Johnston, 10th ed. 1897); *A Manual of Hygiene, Public and Private* (1874); *Lectures on the Preservation of Health* (1868); *The Prevention of Contagious Diseases* (1871).

CAMERON, CHARLES DUNCAN (? -1870). An English soldier and explorer. He participated in the Kaffir War of 1846-47, and afterwards in the Crimean War, and served with distinction at Kars, and afterwards, on special duty, at Trebizond. In 1860 he was appointed British consul in Abyssinia, but he did not assume the duties of this office until early in 1862. In June of this year he proceeded from his residence at Massowah to Gondar, for the purpose of delivering a letter and presents from Queen Victoria to King Theodore, but he was here thrown into prison by the King in 1864 for alleged interference in Abyssinian politics, and was held for two years, when he was surrendered to Rassan, the agent of the British Government. Soon afterwards he, with Rassan and other persons, was again imprisoned by King Theodore, and the party was released only when a British force advanced to their rescue. Cameron's account of his experiences was published in the *Parliamentary Printed Papers* (1868-69).

CAMERON, DONALD (c.1695-1748). A Scottish chief, known as 'The Gentle Lochiel.' He was born at Achnacarrig, Lochiel, Inverness. He supported the young Pretender, Charles Edward, who landed in Scotland in 1745. When Lochiel suggested awaiting reinforcements from France, Charles taunted him into invasion of England. Lochiel took Edinburgh in September, 1745, distinguished himself at Prestonpans, marched as far south as Derby, returned to Scotland and captured Falkirk. Governed by his strict but just and humane discipline, his command gained honorable repute by their conduct and forbearance. He opposed the plan of the night attack on Cumberland's army at Culloden, where he was severely wounded. After vicissitudes, he escaped to France, where he was afterwards master of horse to 'the Young Chevalier.' He is the hero of Campbell's poem, *Lochiel's Warning*.

CAMERON, Sir DUNCAN ALEXANDER (1808-88). An English soldier. He entered the army in 1825, became a colonel in 1854, and served with distinction in the Crimean War. He commanded a regiment at the Alma, and the Highland Brigade at Balaklava and at the siege of Sebastopol, where he took a prominent part

in the assault upon the outworks. He commanded the troops in New Zealand in 1863, and in the following year was made a knight commander of the Order of the Bath, in recognition of his services against the Maoris. He became lieutenant-general in 1868 and general in 1874, and from 1868 to 1875 was governor of the Royal Military College at Sandhurst.

CAMERON, GEORGE FREDERICK (1854-85). A Canadian poet, born at New Glasgow, Nova Scotia. Educated at Queen's University, Kingston, he passed several years in the United States and then returned to Canada, becoming editor of the *Kingston News*. A master of rhythm and cadence, Cameron has the most intensely lyrical poet Canada has yet produced. His verse was praised by Swinburne, Tennyson, and Matthew Arnold. Consult: *Lyrics on Freedom, Love, and Death*, edited by C. J. Cameron (Boston, 1887); and Stedman, *Victorian Anthology* (New York, 1895).

CAMERON, JAMES DONALD (1833-). An American capitalist and politician, known as 'Don' Cameron. He was born in Harrisburg, Pa., the eldest son of Simon Cameron (q.v.); graduated at Princeton in 1862, and became engaged in banking and various industrial enterprises. As president of the Northern Central Railroad, he did great service to the Union cause during the Civil War. In 1876 he was appointed Secretary of War, and in March, 1877, succeeded his father as United States Senator. By successive reelections he retained his seat until 1897, when he retired from public life. In 1880 he was chairman of the Republican National Committee.

CAMERON, JOHN (1579-1625). A Scotch scholar and divine. He was born in Glasgow and was educated at the university of that city, where, in his twentieth year, he held an appointment as reader in Greek. In 1600 he set out to travel in France, where his ability and erudition secured for him a philosophical professorship in the University of Sedan. He afterwards acted as a Protestant clergyman in Bordeaux, and on the death of Gomarus (1618), was appointed to the divinity chair in the University of Saumur, an appointment he held until 1620, when, returning to Britain, he was appointed principal of the University of Glasgow (1622); but in less than a year he returned to Saumur; thence to Montauban, where he received a divinity professorship (1624). Here his opposition to the party who advocated a civil war made him many enemies, by one of whom he was stabbed in the street (May 13, 1625); and he died from the effects of the wound a few months later. He was considered one of the best scholars of his time; in biblical criticism he was inclined to be perverse; where there was a difficulty, he usually chose the opposite view to that held by other divines, especially Beza. His theological opinions were of a somewhat lax character, his works being said to be the foundation of Amyraut's doctrine of universal grace. So he is called the founder of the moderate Calvinistic school of Saumur. His collected works were published with a memoir by L. Cappel (Geneva, 1642).

CAMERON, RICHARD (? -1680). A Scotch minister, born in Falkland, Fife. He was

founder of the sect of Cameronians, a term popularly applied to but declined by the Reformed Presbyterians. The son of a tradesman, he was an apt pupil at the village school, and while still a youth became schoolmaster and precentor. He espoused the cause of the itinerant field-preachers, and, possessing natural eloquence, was licensed and admitted to their numbers. In 1679 he joined banished friends in Holland, but returned in 1680, and with others strenuously resisted the measures that reinstated the Episcopal Church in Scotland, and proscribed the meetings for public worship of unauthorized religious bodies. He persisted in preaching in the fields and antagonized the Government by an attitude of defiance. In June, 1680, with twenty well-armed companions, he entered the town of Sanquhar, and in the market-place formally renounced allegiance to Charles II., for abuse of power, and declared war against him and his adherents. They retired to the hills between Nithsdale and Ayrshire, and succeeded in evading capture for a month, though a price of 5000 marks was set upon Cameron's head by the Government, and 3000 for the heads of the other leaders. They were surprised by a superior force in Aird's Moss, July 20, 1680, and after a brave fight Cameron was killed. His hands and head were cut off and fixed upon the Netherbow Port, Edinburgh. The followers who escaped were induced by the Edinburgh Convention of 1689 to assist in the revolution, and formed the nucleus of the renowned Cameronian regiment (q.v.) of the British Army. Consult Herkless, *Richard Cameron*, in Famous Scots Series (New York, 1896).

CAMERON, SIMON (1799-1889). An American politician. He was born in Donegal, Pa., was a printer and then an editor, and early in life became prominent in State and national politics. In return for his services toward securing the renomination of Andrew Jackson, he obtained the Pennsylvania political patronage and valuable Government contracts, and thus acquired the beginnings of his great fortune. Largely through his efforts James Buchanan was elected to the United States Senate and later became President. In 1845 Mr. Cameron, now very wealthy, was elected by the Democrats to the United States Senate. He had always been a protectionist, and when his term expired (1849) he became a leader of the People's Party and fused it with the new Republican Party, and was again elected to the Senate in 1856. In 1860 he was a prominent candidate for the Presidency in the convention that nominated Lincoln, and in 1861 was by the latter appointed Secretary of War, though his appointment was bitterly opposed by many men of prominence. Soon after becoming a member of the Cabinet, he expressed himself in favor of arming fugitive slaves, a policy which President Lincoln then opposed, and much evidence being adduced in Congress to prove the corruption of his administration of the department, he was asked, in January, 1862, to resign his portfolio. From then until the following year he served as United States Minister to Russia. He rendered the country a valuable service in opposing the efforts of those who sought to defeat Lincoln's renomination. He was chosen United States Senator in 1866 and again in 1872. In the administration of President

Hayes he strenuously opposed the executive policy of civil-service reform, and in 1877 he resigned his seat in order that his son, James Donald Cameron, might be elected in his place, thereby virtually keeping in the family the almost entire control of the Republican party in Pennsylvania.

CAMERON, VERNY LOVETT (1844-94). An English explorer. He was born at Weymouth, Dorsetshire, entered the British Navy in 1857, and saw service on the east coast of Africa. In 1873 he was sent by the Royal Geographical Society on a second expedition to relieve Livingstone. In August Lieutenant Cameron met Livingstone's servants bearing their master's body to the coast. Cameron resolved to push on, and was the first European to cross tropical Africa from east to west, reaching the Atlantic in November, 1875. He found some of Livingstone's papers and a map, explored the southern half of Lake Tanganyika, and learned that the Lualaba was really the Upper Congo. On his return he received many honors, including a D.C.L. from Oxford. He was also chosen to membership in more than thirty scientific societies. He was promoted a commander in the navy. He published an account of his travels under the title *Across Africa* (2 vols., 1876, 2d ed., 1885). In 1878-79 he traveled in Asiatic Turkey and on his return published *Our Future Highway* (1880), advocating a railway from Tripoli to India. In 1882, in company with Sir Richard Burton, he visited the African Gold Coast in search of gold.

CAM'ERON'NIANS. Followers of John Cameron (q.v.), of Scotland; officially known as Reformed Presbyterians. (See PRESBYTERIAN CHURCHES.) They are moderate Calvinists, and assert that the will of man is determined only by the practical judgment of the mind; that the cause of men's doing good or evil proceeds from the knowledge that God infuses into them; and that God does not move the will physically, but only morally, by virtue of its dependence on the mind. This peculiar doctrine of grace and free will was adopted by many eminent teachers, who thought Calvin's doctrine too harsh.

CAMERONIANS (from Richard Cameron). A celebrated regiment of Scotch infantry in the British Army. In the British Army list it is described as "The Cameronians (Scottish Rifles)," Territorial District 26; depot or regimental permanent headquarters, Hamilton, N. B. The regiment consists of two battalions, each of about 1000 men of all ranks, and belongs to the oldest division of the British Army. In its origin it dates back to the time when the Covenanters, a religious body embracing a large majority of the Scottish people during the Seventeenth Century, were in arms for the defense of their faith, and in many instances went armed to their public meetings. The movement became so formidable that the Government pronounced illegal all armed assemblages for religious purposes. Richard Cameron, whose father, a small shop-keeper, had given him a good education, joined the ranks of the Nonconformists, and became so obnoxious to the authorities that he was compelled to take refuge in Holland. He returned in 1680, and shortly after the defeat of the Covenanters at Bothwell Bridge, in that year, was slain in a skirmish at Aird's Moss.

The few troops he had been able to collect, and at whose head he was killed, formed the nucleus of the Cameronian regiment of to-day. Consult: Cunningham, *Church History of Scotland* (Edinburgh, 1883); and Burton, *History of Scotland* (London, 1873).

CAMEROON, ká'mé-róon'. See KAMERUN.

CAMILING, ká'mé-léng'. A town of Luzon, Philippines, in the Province of Tarlac, about 16 miles northwest of Tarlac. Population, 24,000.

CAMIL'LA. In Roman fable, a virgin wonderfully swift of foot, who aided Turnus against Æneas (Vergil, *Æneid*, vii. 803). She was said to be a daughter of Metabus, King of the Volscian town Privernum (Piperno).

CAMILLE, ká'mél' (Lat. *Camilla*). (1) The heroine of Corneille's *les Horaces*. Her lover is one of the Curiatii killed by her brothers, as in the old Roman legend on which the play is founded. When she denounces the act, and the patriotism which caused it, she is stabbed by her brother. (2) The heroine and title-character of the English adaptation of *La Dame aux camélias*. Camille is Marguerite Gautier in the original.

CAMIL'LO (Lat. *Camillus*). (1) A Sicilian lord who warns Polixenes of Leontes's designs against his life in Shakespeare's *Winter's Tale*. He escapes to Bohemia with the former monarch and remains there until the reconciliation of Polixenes and Leontes at the close of the piece. He is instrumental in bringing about the marriage of Florizel and Perdita. (2) The husband of 'the white devil' in Webster's play of the latter name. He meets his death through the agency of the Duke of Bracciano, his wife's paramour. See COROMBONA, VITTORIA.

CAMIL'LUS and **CAMIL'LA** (Lat.). The names applied in ancient Rome to the boys and girls who shared in sacrificial ceremonies. If they were designed for the priesthood, it was necessary that their parents should be still living and free-born.

CAMILLUS (Lat.). A pseudonym used in journalistic writing by Fisher Ames. It was used also by Alexander Hamilton and Rufus King.

CAMILLUS, MARCUS FURIUS (B.C. ? c.365). A celebrated Roman patrician who first makes his appearance as consular tribune (B.C. 403). His military career was a series of unbroken successes, according to the accounts which have come down to us; but these accounts were shown by Niebuhr to possess a considerable admixture of mythological or poetic fiction. In 396 Camillus was made dictator, during the Veientine War, in which he mined and captured the city of Veii; but the proud splendor of his subsequent triumph offended the Roman populace, who were still further displeased when Camillus demanded a tithe of the spoils of Veii. In order to fulfill a vow made to Apollo, on condition of victory. In 394 Camillus was again elected consular tribune, and besieged Falerii, whose inhabitants, after bravely defending themselves, were led by a magnanimous act of Camillus to yield unconditionally. Afterwards, Camillus, being accused of peculation, and foreseeing certain condemnation, banished himself from Rome, 391, and lived in retirement at Ardea, until Brennus, at the head of his wild

Gauls, had swept through Etruria, and captured and destroyed the whole of Rome except the Capitol. Camillus was now recalled and appointed dictator a second time. He achieved a decisive victory over the invaders, rebuilt Rome, and obtained new victories over the Volsci and others. In 386 he was elected dictator for the third time, but refused the office. In 381 Camillus was victorious in the war of Rome against Præneste and other Latin towns; and in 368 he was elected to his fourth dictatorship, but abdicated during the same year. In 367, when war broke out with the Gauls, Camillus, though 80 years old, accepted the dictatorship for the fifth time, defeated the barbarians near the site of Alba Longa, and made peace between patricians and plebeians. After this he erected near the Capitol a temple to Concord, and, having retired from public life, died about 365, of the plague, lamented by the whole Roman people.

CAMINATZIN, kă'-mè-ná-tsén', or **CACU-MAZIN** (? -1520). King of Tézuco, nephew or cousin of Montezuma, and one of the leaders of the war party among the Mexicans after the capture of the King by the Spaniards. Caminatzin successfully opposed every effort of Cortes to make peace with the natives of the City of Mexico, but was finally taken captive through the instrumentality of Montezuma. He perished on the night of the evacuation of Mexico by the Spaniards (the *noche triste*), June 30, 1520.

CAMISARDS, kām'ī-zārdz (Fr., from OF. *camise*, smock, less probably from Fr. *camisade*, attack by night). The active participants in the Protestant revolt of 1702 in the Cévennes, a mountainous region in Southern France, against the persecutions that followed the revocation of the Edict of Nantes. (See NANTES, EDICT OF.) The Camisards belonged to the Romance-speaking people of Gothic descent, who took part in the earliest movements toward religious reform. Calvin was warmly welcomed when he preached at Nîmes, and Montpellier became the chief centre for the instruction of Huguenot youth; but it was in the triangular mountainous plateau called Cévennes, and chiefly among the small farmers, the cloth and silk weavers, and the vine-dressers, that Protestantism was most widely diffused. The people were, and still are, very poor, but they are intelligent and pious, and add to the deep fervor of the Provençal character a gravity that is probably the result of the trials and sufferings of their ancestors. The Edict of Nantes of 1598 and the moderate and conciliatory policy of Richelieu had brought France relief from religious strife, and the Protestants were among the most industrious and useful of the population, but the Court of Louis XIV., in which Madame de Maintenon and the Jesuits had become supreme, would not long tolerate heresy in the kingdom. A policy of gradually destroying the privileges of the dissenters was begun. They were shut out from public offices and trade corporations; they were forbidden to marry with Roman Catholics, and the conversion of their children seven years old and upward was encouraged and almost enforced. In October, 1685, the Edict of Nantes was finally revoked. All dissenting churches were to be destroyed, religious meetings were forbidden under pain of imprisonment and con-

fiscation of property; all pastors who would not stop preaching at once and change their faith were to be banished within fifteen days; exemption from taxes and increased salaries were promised to converted ministers. Huguenot schools were suppressed, and all children were to be baptized and brought up in the Roman Catholic faith. All Huguenots, except ministers, were prohibited from going abroad, and the property of those who had already gone was declared forfeited unless they returned within four months. In carrying out this harsh decree the most savage persecution was indulged in. Torture, hanging, insults worse than death to women, the galleys and imprisonment for life were the ordinary occurrences for the next sixty years. (See DRAGONNADES.) In the twenty years preceding the Revocation, it is believed that 400,000 Protestants fled from France, and that 600,000 escaped in the twenty years that followed.

In the Cévennes, however, the people were too poor to escape, and all over Languedoc the Huguenots assembled for purposes of worship in secret. A religious ecstasy ran through the country, and so-called prophets appeared among the people. In connection with this phase of the excitement, there were noted those abnormal physical and mental conditions which always follow prolonged fasting and vigils under strong religious excitement. Louvois, Louis XIV.'s War Minister, determined to put down this movement in an exemplary manner. An army of 40,000 was raised, and forts were erected at Nîmes, Saint Hippolyte, Alais, and Anduze. The Abbé du Chaila, a Roman Catholic missionary from Siam, had been appointed inspector of missions in the Cévennes. He introduced the 'squeezers' (an instrument of torture which resembled the Scotch 'boot'), and his cruelty at last broke the patience of the victims. His assassination, July 23, 1702, was the first blow in the war. There was to have been a general massacre of Roman Catholic priests, but the plan failed, and the originator, Esprit Séguier, soon fell. He was succeeded by La Porte, an old soldier, who, as his forces increased, assumed the title of Colonel of the Children of God, and named his country the Camp of the Eternal. His captains were selected from those on whom the prophetic influence had fallen, such as the forest ranger, Castanet, the wool-carders, Condère and Mazel, and the soldiers, Catinat, Joany, and Ravenel; but the most famous were Roland and Jean Cavalier, the baker's boy (see CAVALIER, JEAN). For three years the Camisards held out. Against them was sent an army of 60,000 men, among them an English brigade, which had just returned from the persecution of the Vaudois. A policy of extermination was commenced, and in the upper Cévennes alone 466 villages were burned, and nearly the entire population put to the sword. The insurgents, on the other hand, indulged in acts of violence against the Catholic population and priesthood, of whom more than 4000 are estimated to have perished. Catholic churches were burned in large numbers. Clement XI. issued a bull against the "execrable race of the ancient Albigenses," promising remission of sins to the holy militia which was now formed among the Roman Catholic population under the name of Cadets of the

Cross. The formidable force brought against them induced Cavalier to listen to proposals, and he finally assented to a surrender on being guaranteed liberty of conscience, the right of assembly outside of walled towns, the liberation of all his people then in durance, and the restitution to emigrants of their civil rights and property. Still the greater part of the army, under Roland, Ravenel, and Joany, refused, and insisted upon the complete restoration of the Edict of Nantes. The Camisards continued the war until the beginning of 1705, at which time their leaders had been killed or dispersed, and they had become disorganized. In 1711 all outward signs of the Reformed religion had disappeared, and on March 8, 1715, a few months before his death, Louis XIV., by a special medal and by proclamation, announced the entire extinction of heresy. Fourteen years afterwards, in spite of the strictest surveillance, aided by military occupation, there had been organized in Languedoc 120 churches, which were attended by 200,000 Protestants. Persecution could not utterly suppress them; but it was not until 1775 that the last galley slave from Languedoc was liberated, and not until 1789 that the National Assembly repealed all the penal laws against Protestantism. Consult: Baird, "The Camisard Uprising," in *Papers of the American Society of Church History*, Vol. II. (New York, 1890); Bray, *The Revolt of the Protestants of the Cévennes* (London, 1870); Smiles, *The Huguenots in France After the Revocation of the Edict of Nantes* (London, 1877); Goiffon (ed.), *Relation historique de la révolte des fanatiques ou des Camisards* (Nîmes, 1874); Louvreuil, *Le fanatisme renouvelé* (Avignon, 1702-07). See CÉVENNES.

CAM'LAN. A famous battle in Arthurian legend. It saw the death of Arthur and the dissolution of the Round Table. Antiquarians place it in Cornwall, England, and set its date either in A.D. 537 or 542. See ARTHUR, KING; also MODRED.

CAMLET (Ar. *khamlat*, camlet, from *khaml*, pile, plush; at an early period folk etymology wrongly referred it to *camel*). A fabric originally made of camel's hair, and more recently of the hair of the Angora goat. At present camlets are woven from wool alone, or from wool and cotton or linen mixed, and spun hard.

CAMMERHOFF, kām'mēr-hōf, JOHN CHRISTOPHE FREDERIC (1721-51). A Moravian bishop and missionary in America. He was born near Magdeburg, Germany; became a bishop of the Moravian Church in 1746, and in the same year came to America, where until his death he acted as Bishop Spangenberg's assistant. He devoted his attention largely to missionary work among the Indians, especially among the Iroquois, and met with considerable success in gaining converts. He was adopted into the Turtle tribe of the Oneidas, under the name Gallichwio ('A Good Message'), and for more than a generation was remembered with singular respect and veneration by the Indians of the Confederacy. His death was caused by the exposures and hardships incident to a journey of 1600 miles to Onondaga, which he made in 1750.

CAMÕES, kâ-mōnsh' or kāmō'ēnsh, commonly written in English CAMOENS, LUIZ DE (c.1524-79). The greatest poet of Portugal, who exerted an important influence on the na-

tional drama, and developed the Portuguese lyric to its highest perfection, but owes his fame mainly to the celebrated historical epic, *Os Lusíadas*. Son of a sea captain, who was early lost in a shipwreck, and descendant of a family of distinction and rank, Camões was born in Lisbon—or more probably in Coimbra—in 1524 or 1525, about the time of the death of Vasco da Gama, to whom he was related, and whom his grandfather, Antão Vaz, had accompanied on his first voyage to India. He is supposed to have attended the University of Coimbra, although his name does not appear upon the records. At all events, he early showed remarkable proficiency in the classics and in contemporary literature, presumably due to the guidance of his uncle, Bento de Camões, who was then prior of the famous Santa Cruz monastery. It was during these early days in Coimbra that Camões was inspired by some fair but unknown maiden, whom he celebrated in a series of canzoni, sonnets, and elegies, Petrarchian in form and platonic in spirit, but notable for their purity of diction and grace of form. Having finished his studies, Camões went to Lisbon in 1542, where he frequented the Court and conceived a romantic passion for Catherina de Athaide, one of the Queen's ladies of honor, whom he celebrated under the anagram of Natercia, and whose complaisance was the beginning of all his troubles. Banished from the Court and separated from the woman he loved, Camões joined the expedition of John III. against Morocco, where he served two years, losing an eye during a naval engagement in the Strait of Gibraltar. On his return to Lisbon, he found no more praise for his bravery than formerly for his poems. Disappointed in all his hopes, he determined to leave his native land forever, and sailed for India as a common soldier. For sixteen years he led an adventurous life in the East, unprosperous for the most part, though for a time he held a lucrative position at Macao, as administrator of the effects of deceased persons. But he misused his powers, made enemies by his writings, incurred debts, and suffered misadventures in love. At last he turned his steps homeward, and after disheartening delays and countless hardships, reached Lisbon once more, in 1570, only to find it overrun with the plague, in the throes of the Inquisition, and governed by a young, feeble, and visionary monarch. Nevertheless he published his epic, *Lusíad*, the only valuable possession which he had brought back from all his wanderings, and dedicated it to the young King, Sebastian, who was very gracious; but all the patronage bestowed upon the author was a niggardly pension of about \$20, and permission to frequent the Court. Camões survived a few more troubled years, living with his aged mother. When Sebastian undertook the African campaign, his patriotic zeal flamed up once more, though he could not accompany the King either as poet—since Diogo Bernardes and Cortereale were preferred to him—nor as soldier, because too old. The news of the defeat of Alcacer-Quebir broke his heart. In a letter, the last lines that he wrote, he says: "It was not enough that I should die in my fatherland; I am dying with it." He died in a hospital in 1579, and his interment passed almost unnoticed.

The *Lusiad* (*Os Lusíadas*, The Lusitanians) celebrates the chief events in the history of Portugal, and is remarkable among modern epics for the admirable manner in which it has imitated the true national and popular spirit of ancient epic poems. Among the most famous passages are the tragic story of Iñes de Castro, and the apparition of the giant Adamastor, who appears as the Spirit of the Storm to Vasco da Gama when passing the Cape. The metre of the *Lusiad* is the familiar *ottava rima* of the Italian poets, and his treatment of it is full of charm. The chief interest of the poem is due to the fiery spirit of patriotism which pervades it, and its intrinsic beauty has made it one of the masterpieces of what Goethe termed the 'world-literature.' It has been translated into all the principal languages of Europe. Besides his epic, Camões wrote sonnets, odes, elegies, satires, epigrams, epistles, and three comedies—*Os Amphytrypes*, modeled upon Plautus; *King Seleucus*; and *Filodemo*. The most complete edition of his works is that of the Visconde de Juromenha (6 vols., Lisbon, 1860-69); a cheaper and more convenient edition is that of Theophile Braga (3 vols., Oporto, 1874). For his biography, consult: Adamson, *Memoirs of the Life and Writings of Luis de Camões* (London, 1820); Braga, *Historia de Camões* (3 vols., Oporto, 1873-75); Castello-Branco, *Luis de Camões* (Oporto, 1880); Burton, *Camões, His Life and His Lusiads* (London, 1881); Storck, *Luis de Camoens Leben* (Paderborn, 1890).

CAM'OMILE. See CHAMOMILE.

CAMONICA, kām'ō-nē'kā, or VALLE CAMONICA. A picturesque valley in the Province of Bergamo, North Italy, consisting of the basin of the Oglio River, inclosed by outlying and densely wooded ridges of the Rhaetian Alps. It extends for 50 miles from northeast to southwest to Lake Iseo. It has iron, copper, and lead mines and marble and slate quarries. Its soil is fertile, and agriculture is well developed, maize, grapevines, and mulberry-trees being extensively cultivated.

CAMORRA, kā-mōr'rá (OIt., frock, cassock). A secret society with ramifications throughout the former Kingdom of Naples, which exerts considerable influence among the lower classes in that part of Italy, and whose activity extends to higher official quarters. The members are called *Camorriste*. Under the Bourbons, Camorriste appeared in public places on all occasions of popular amusement, and levied contribution which their victims dared not refuse. They undertook the transport of smuggled goods, and contracted for the commission of serious crimes. Their readiness for violence and murder, and their close association among themselves, made them so much dreaded that Camorriste who had been thrown into prison succeeded in exacting money from their fellow-prisoners and from the jailer himself. When at the height of its power, the society had a central rendezvous in every large provincial town, and twelve in the city of Naples. Those who belonged to each of these sections of the society were under the absolute government of a chief elected by themselves, with whom was associated a treasurer. The latter had the charge of the common fund into which all the Camorriste of that section paid their entire gains for equal dis-

tribution among all their associates. Candidates for membership were obliged to show that they had been guilty neither of espionage nor theft; also that neither their wives nor their sisters were prostitutes, and to swear upon an iron crucifix a fearful oath of fidelity and secrecy. The candidate remained for a year, with the designation of *picciotto d'onore*, as a pupil under an old Camorrista; and having completed this probation, and given proof of his courage and obedience in circumstances involving danger of life, was advanced to the rank of a *picciotto di sgarro*. Finally, after a longer period, in which he had given proof of his fitness on a number of occasions, he was admitted to full membership of the society as a Camorrista. Each Camorrista carried about with him two knives of peculiar form, by which the members of the society recognized each other. They were held under the strictest discipline. Disobedience was punished by flogging, suspension from employment, or expulsion; treachery, by death. If two Camorriste quarreled, their chief decided the question between them; but in difficult cases a duel with daggers was the mode of decision. Under Ferdinand II. the Camorra was tolerated for political reasons. The Government of Francis II. endeavored to put down the society, and the police received instructions to seize and transport all known members of it. Those who remained entered into alliance with the Garibaldi Committee, and rendered essential service in the expulsion of the Bourbons. When the Neapolitan and Sicilian influence became strong in the politics of the new Italy (see ITALY), the Government attempted to use the Camorra in its struggle with brigandage, and thus strengthened the influence of the society by making it a political force, as it had often been under the Bourbons. Of recent years the Camorra has tended to assume more of the nature of a political machine, manipulated for the purpose of plunder. For a number of years the society was in full control of the municipal government of Naples, and included among its members the heads of the chief departments and practically the entire body of city employes. The association put up offices for sale, guaranteed officials immunity in the pursuit of peaceful speculation, and, in the last extreme, defended them in the courts. Conditions finally became so scandalous as to warrant (1899) the intervention of the Italian Government. Municipal government in Naples was suspended, while a royal commission was appointed to investigate the operations of the Camorra. The revelations of the commission led to the formation of an Honest Government League, which succeeded in completely defeating the candidates of the Camorra in the municipal elections of 1901. Consult: Monnier, *La Camorra* (Florence, 1863); Heckethorn, *The Secret Societies of All Ages and Countries* (New York, 1897); Umiltà, *Camorra et Mafia* (Neuchâtel, 1878); Blasio, *Usi e costumi dei camorriste* (Naples, 1897).

CAMOUFLET, kā-mōv'flā, *Fr. pron.* kā'mōv'flā'. See MINES AND MINING, MILITARY.

CAMP, MILITARY. A collection of tents or huts for the shelter of troops, in a position, or on a piece of ground, specially adapted or prepared for such occupation. The evolution of

the modern camp, or military encampment, is practically the history of modern armies, strategy, engineering, and sanitation. Of ancient camps the Romans give us the best example. The advance party consisted of a tribune and several centurions, whose duty it was to select a suitable site for the camp, marking out, first of all, a spot for the *prætorium*, or general's tent, round which, as a centre of the whole system, the rest of the camp was marked out. The camp streets were broad, measuring from 50 to 100 feet, and allowance was always made for the *forum*, or public market-place. Polybius (in the Second Century B.C.) is authority for the full details of the Roman camp system. With regard to their general description, he states that the best conception which can be formed of a Roman camp of the more permanent kind is by regarding it as a military town. According to the same authority, the Greeks trusted mainly to the judicious selection of their ground, and regarded the natural advantages which they thus secured as supplying in a great measure the means of artificial defense. The Greeks, consequently, did not use the regulation type of camp so rigorously adhered to by the Romans. The Roman plan seems to have been the one most generally adopted through the Middle Ages, with such additions as new arms, new formations, and new branches necessitated. Modern camps, in home countries or possessions, are chosen for their particular local advantage, sanitation and the general health of the troops being the first consideration. In time of war, or when campaigning in an enemy's country, there must be added precautions against attack, locating the camp in a place giving every possible natural advantage. Care is taken that there are no commanding positions within range where an enemy's artillery could be effective; that it is capable of defense; that it is roomy and safe enough to assemble the troops or get under way without hindrance or confusion; and that there are water facilities for man and beast. These and such other rules as circumstances may dictate form a general basis throughout armies of the civilized world. In the United States Army camps are organized according to directions given in the drill regulations. See ENCAMPMENT.

CAMP, kân, MAXIME DU. See DU CAMP, MAXIME.

CAMPA, kâm'pâ. See ANTI.

CAMPAGNA, kâm-pâ'nyâ, GIBOLAMO, called de Vergna (1552-c.1623). An Italian sculptor. He was born in Verona, and studied under Sansovino and Cataneo, many of whose works he completed. His best-known original productions consist of the isolated altar in the Santi Giovanni e Paolo, Venice, and the bronze group representing Christ resting on a globe carried by the four Evangelists, at San Giorgio Maggiore, Venice.

CAMPAGNA DI ROMA, kâm-pâ'nyâ dê rô'mâ (It., plain of Rome). An undulating, uncultivated, and unhealthy plain of Italy surrounding Rome, including the greatest part of ancient Latium. Applying the name in a broad sense to the district extending from Cape Linaro, south of Civitâ Vecchia, to Terracina, beyond the Pontine Marshes, its length is about 90 miles, and its breadth inland, to the Alban and

Sabine hills, ranges from about 25 to 40 miles. A broad strip of sandy plain skirts the Mediterranean. The ground, which never rises higher than 200 feet above the sea, is almost entirely volcanic, and the lakes represent craters of extinct volcanoes. The vapors rising from this district, and especially from the Solfatara (q.v.), produce the pestilential atmosphere styled *aria cattiva*. The number of inhabitants is very small, and in summer they are driven from the Campagna di Roma by its pestilential air, and seek shelter in Rome and other neighboring places. In autumn herdsmen descend from the Apennines to the Campagna di Roma with their herds, the pasture in some parts being rich and abundant. Until the Fifth and Sixth centuries A.D. the Campagna di Roma was well inhabited, though not very healthful. In the last century of the Roman Republic and under the emperor, it was filled with the luxurious villas of wealthy Romans. The invasion of the barbarians began the devastation of the Campagna di Roma, and the insecurity of the region during the Middle Ages and the failure of the water-supply led to its gradual depopulation and the increase of the malignant conditions. During recent years, improved drainage, the planting of eucalyptus trees, and other works undertaken by the Government have done much to make the Campagna di Roma more healthful and lead to its gradual reclamation. The peculiar scenic aspects of the Campagna, with its many remains of Roman structures, combined with the characteristic atmospheric effects, have rendered it an inspiring subject for painters.

CAMPAGNOLA, kâm'pâ-nyô'lâ, DOMENICO (c.1490-c.1564). An Italian painter and engraver. He was born in Padua, and studied in the school of Titian, where his proficiency is said to have aroused the jealousy of his master. His best-known works are four pictures of prophets, in the Venice Academy; oil pictures in the Scuola del Carmine, Padua; and fresco paintings in the Scuola del Santo, Padua, which are said to rival those of Titian in the same place. His etchings are executed in a masterly style. The best-known are the "Descent of the Holy Spirit on the Day of Pentecost" and the "Assumption of the Virgin."

CAMPAIGN, kâm-pân' (Fr. *campagne*, *campagne*, open country, military operations; Med. Lat. *campania*, level stretch of country, from Lat. *campus*, field), MILITARY. A connected series of military operations having a definite purpose and object. It may apply to the whole field of hostilities, or to each separate and distinct command, if such command is operating with its own programme. For example, in the Civil War of 1861-65, may be cited General Grant's campaign, General Sherman's campaign, General Lee's campaign; while, on the other hand, under the title of the Egyptian Campaign was embraced every operation of the entire war.

CAMPAIGN, THE. A poem with a Latin version, by Joseph Addison, written at the instance of Lord Godolphin, to celebrate the battle of Blenheim in 1704. The amazing success of the piece was largely due to its happy description of Marlborough as one who "rides the whirlwind and directs the storm." It gained for the author first a commissionership of appeals and then the office of Under Secretary of State.

CAMPAN, kām'pān', JEANNE LOUISE HENRIETTE GENEST (1752-1822). A French author. She was first lady of the bedchamber to Marie Antoinette, and her faithful companion till they were separated at the sacking of the Tuileries, August 10, 1792. She then established a school at Saint-Germain, and later won the favor of Napoleon, who made her superintendent of an academy at Ecouen founded by him for the education of daughters and sisters of members of the Legion of Honor. On the abolition of the school in 1814, she retired to Mantes, where she died, among friends, but saddened by the calumnies of Royalists, who could not forgive her connection with Napoleon. She left some interesting and valuable *Mémoires sur la vie privée de Marie Antoinette* (1823), followed by *Journal anecdotique* (1824), a treatise, *De l'éducation*, and some pedagogical essays, *Correspondance inédite avec la reine Hortense* (1835).

CAMPANA, kām-pā'ná, FABIO (1819-82). An Italian composer, born in Leghorn. He was educated at the Musical Lyceum in Bologna, and in 1850 went to London, where he remained, teaching and composing, until his death. His works consist of *Caterina di Guisa* (1838); *Giulio d'Este* (1841); *Esmeralda* (1869); and many songs and romances.

CAMPAÑA, kām-pā'nyá, PEDRO (1503-80). A Flemish-Spanish painter. He was born in Brussels, and his name is said to have been originally Pieter de Kempeneer. He completed his studies in Bologna and Rome, and established an academy in Seville in 1547. His famous "Descent from the Cross" (1548), now in the cathedral, was a favorite study of Murillo. Later in life he returned to the Netherlands. The pictures of Campaña are full of life, and are characterized by truthful delineation and powerful coloring. Several of them are at present in various churches of Seville.

CAMPANELLA, kām'pá-nē'lá, TOMMASO (1568-1639). An Italian monk and philosopher. He was born in Stilo, Calabria, and studied in Naples and Cosenza. His *Philosophia Sensibus Demonstrata*, which included a defense of Teleisus against the scholasticism of the Aristotelians, was published in 1591. He was accused of heresy and of conspiring against the Government, and spent twenty-seven years in prison at Naples, during which time he wrote much, one of his works being his famous "City of the Sun," which has been translated into English by T. W. Halliday, and published in *Ideal Commonwealths* (Morley's *Universal Library*). He was released through the intervention of Pope Urban VIII., but renewed persecutions compelled him to seek refuge in France, where he remained until his death. He was kindly received by Richelieu, and granted a pension of 3000 livres by Louis XIII. He expounded a philosophy many of whose tenets resemble the views of Descartes and Kant. His works, eighty-two in all, and treating of many different subjects include: *De Sensu Rerum et Magia* (1620); the *Civitas Solis*, mentioned before (printed with his *Philosophia Epilogistica Realis*, 1623), a description of a philosophic republic; and *Atheismus Triumphatus* (1636), which assumes the character of an apologia. His complete works have been edited by d'Ancona (Turin, 1854). His sonnets were trans-

lated by J. A. Symonds, in a volume with those of Michelangelo (1878). For his biography, consult: Baldacchini (Naples, 1840), and Amabile (Naples, 1883-87), as well as Dareste, *Morus et Campanella* (1843).

CAMPANERO, kām'pá-ná'rô (Sp., bellman, from *campana*, bell). The bell-bird.

CAMPANERTHAL, kām-pā'nēr-täl, or **KAMPANERTHAL**, DAS. A work on the immortality of the soul by Jean Paul Richter, which derives its name from the beautiful valley of Campan in the Pyrenees, traversed by the Adour.

CAMPANHA, kām-pā'nyá (Portug., plain). A town of Brazil in the State of Minas Geraes, about 150 miles northwest of Rio de Janeiro (Map: Brazil, H 8). It is situated in a gold-mining region and has several churches, a Latin school, a hospital, theatre, etc. Population, nearly 7000.

CAMPANIA (Lat., from Lat. *campus*, plain, Gk. *Καμπανία*, *Kampania*). A district of ancient Italy lying along the Tyrrhenian Sea, and bounded on the land side by Latium, Samnium, and Lucania (Map: Italy, J 6). Originally inhabited by people of Oscan race, it was early invaded by the more civilized Greeks, who founded there the cities of Cumæ and Neapolis (Naples). At a later period it came under the Etruscan domination, but the bulk of the population remained Oscan in race and language until Roman times. Campania has always been noted for the volcanic character of the country. Besides Vesuvius (of which the first eruption in historic times was that which destroyed Pompeii in A.D. 79), the whole region north of Naples was and is a scene of volcanic phenomena. Here were the *Campi Phlegræi* of the Greek and Latin writers, the modern *Solfatara* or sulphur-field near Puteoli (Pozzuoli), and here, near Cumæ, was the Lake of Avernus, the fabled entrance to the lower world. Notwithstanding this gloomy character, the great plain of Campania was always noted for its wonderful fertility and its charming climate and scenery. The Romans, who overran it as early as B.C. 340, called it *Campania Felix* (Happy Campania). They did not succeed in Romanizing the inhabitants until after the time of Sulla. The coast of Campania then became a favorite resort for the wealthy Romans, who built handsome villas at Baiæ, Puteoli, Misenum, and elsewhere. Cicero had a villa at Pompeii. In his new reorganization of Italy, Augustus made Campania his first district (*regio prima*). The chief ancient towns were Capua, Cumæ, Neapolis, Nola, Pompeii, and Salernum.

CAMPANILE, kām'pá-nē'lá (It., from Med. Lat. *campana*, a bell). A name adopted from the Italian to signify a bell-tower of the large kind, and usually applied only to such as are detached from the church. This type of tower is found hardly at all outside of Italy, where it is the only prevailing kind of church tower. See BELL-TOWER; BELFRY; MINARET; TOWER; FLORENCE; VENICE.

CAMPANINI, kām'pá-nē'nē, ITALO (1846-96). An Italian tenor, born in Parma. He enlisted in the army of Garibaldi when 14 years of age, and took part in the fight before

Milazzo. Having discovered during the campaign that he had a fine voice, he studied singing in Parma, and made his first appearance as the notary in *La Sonnambula* in his native town. He sang with indifferent success in various opera companies until 1869. In that year he went to Milan and placed himself under the tuition of the celebrated Francesco Lamperti. After a thorough training he made his debut in *Faust* at La Scala of Milan, and was pronounced by a critical audience to be one of the finest tenors of the age. In 1872 he made his London debut as Genaro, in *Lucrezia Borgia*, and in 1873 sang with Christine Nilsson in New York. He was heard in the United States during several subsequent seasons and became the most popular operatic tenor of his day in the country. Endowed with a true tenor voice of great power and sweetness, he was equally equipped to sing lyric and dramatic parts; but he shone especially in rôles demanding manly passion and fervor, e.g. those of *Aida*, *Carmen*, *The Huguenots*, and *Faust*. He was also a notable Lohengrin. His repertoire included nearly 100 operas and oratorios. In later years, partly owing to an affliction of the throat, his voice failed; but his fine method of producing it and his intelligent singing and acting kept him high in popular favor until a few years before his death. He died in Vigatto, near Parma.

CAMPANULA (Med. Lat., dim. from Late Lat. *campana*, bell). A genus of plants of the order Campanulaceæ, distinguished by a bell-shaped corolla with five broad segments. The species number nearly 300 and they are found mostly in the higher latitudes of the northern hemisphere, at high elevations in temperate regions, and about the Mediterranean Sea. The species are mostly herbaceous and are grouped as annuals, biennials, and perennials. The flowers are blue, violet, or white, and many are cultivated as border plants. The name bell-flower or bellwort is given to many, and is sometimes extended to include all the species. One of the most common is the bellflower, *Campanula rotundifolia*, a perennial species indigenous to America, Europe, and Siberia. For illustration, see Plate of **CAMELLIA**, ETC. The Canterbury bell, *Campanula medium*, is a biennial species frequently cultivated. It will flower the first season if sown early and transplanted. Among annual species in cultivation are *Campanula erinus*, *Campanula macrostyla*, and *Campanula Americana*. *Campanula pyramidalis* with blue, lilac, or white flowers, *Campanula glomerata* with pale blue flowers, and *Campanula muralis* are all worthy of cultivation. Formerly medicinal properties were ascribed to some species, and the name throatwort was given to *Campanula trachelium* in England, where it was held valuable in some affections of the throat.

CAMPANULA'CEÆ (Neo-Lat., from Med. Lat. *campanula*, little bell), **BLUEBELL FAMILY**. A natural order of dicotyledonous plants, the species of which number about 1000, embraced in 59 genera. They are mostly herbaceous, a few only being trees or shrubs, and are characterized by alternate exstipulate leaves and usually by a bitter latex. The inflorescence is usually racemose; the flowers regular, 5-parted; and the fruit a capsule or berry. The flowers of most of the species are comparatively large, but in

Phyteuma and Jasione they are small and massed in heads like the compositæ. The Campanulaceæ are mostly found in the temperate and colder climates of the northern hemisphere and the flowers of many are quite ornamental. The fruits of one member of the family (*Canarina campanula*) which grows in the Canary Islands are edible. The chief genera are Campanula, Phyteuma, Jasione, and Lobelia.

CAMPAN'ULA'RIA (Neo-Lat., from Med. Lat. *campanula*, little bell). A 'bell-hyroid' of the siphonophorous family Campanulariæ, common about tide-covered rocks, and characterized by having the "hyroid heads inclosed in a calyx, [and] the medusæ, if free, with gonads on radial canals" (Davenport). These are known as bell-hyroids, and are numerous, the genus Obelia being specially common and well represented on the New England coast. See illustration under **ALTERNATION OF GENERATIONS**.

CAMPARDON, kām'pārdōn', **EMILE** (1834—). A French author, born in Paris. He was educated at the Ecole des Chartes, and later became chief of a department in the National Archives. In this capacity he utilized a great number of documents in the preparation of his literary works, all of which are distinguished by marked originality and by a profound knowledge of the men and affairs of the Eighteenth Century. The following are a few of his principal publications: *Histoire du tribunal révolutionnaire de Paris* (2 vols., 1861); *Marie Antoinette à la conciergerie* (1862); *Madame de Pompadour et la cour de Louis XV.* (1867); *Voltaire, documents inédits* (1880); *L'académie royale de musique au XVIIIe siècle*.

CAMPASPE, kām-pās'pē. A river of Victoria, Australia, which flows north through Dalhousie County and joins the Murray at Echua (Map: Victoria, D 3). The plains along its lower course are well cultivated. Length, about 120 miles.

CAMPASPE (Gk. *Kampdown*). A mistress of Alexander the Great. Apelles is said to have taken her for the model of his "Venus Anadyomene."

CAMPBELL, kām'b'l, or, *Scot. pron. kām'l*. See ARGYLL, MARQUIS OF.

CAMPBELL, ALEXANDER (1788-1866). An American clergyman, the founder of the Disciples of Christ, or 'Campbellites.' He was born in Ireland and was educated at the University of Glasgow. He came to the United States in 1809, and settled in Bethany, Va., as pastor of a Presbyterian church, from which he soon departed and organized a society, now known as the Disciples of Christ, whose doctrine was that the Bible should be the sole creed of the Church. In 1841 he founded Bethany College (Bethany, W. Va.), and remained its president until his death. He established, in 1823, the *Christian Baptist*, which in 1829 became the *Millennial Harbinger*, and which he continued until 1863. He engaged in many controversies and published no less than fifty-two volumes, including hymn-books and a translation of the New Testament. His most typical doctrinal works were *The Christian System* and *Remission of Sin*. He published *Memoirs of Thomas Campbell* (1861), his father and associate in his work. Consult

Richardson, *Memoir of Alexander Campbell* (Philadelphia, 1868). See DISCIPLES OF CHRIST.

CAMPBELL, ALLAN (1815-94). An American civil engineer and railroad president. He was born in Albany, N. Y., and at the age of 21 was chief engineer of a railroad. He built the first railroad ever operated in South America; was prominent in the construction of the Harlem Railroad, the Pacific Railroad, and that from Callao to Lima, Peru, and was president of the Harlem Railroad until succeeded by 'Commodore' Vanderbilt. He was appointed commissioner of public works of New York City in 1876, and during 1883 was comptroller of the city. In 1882 he was defeated as nominee of the Republicans and Independents for the office of mayor.

CAMPBELL, BARTLEY (1843-88). An American dramatist. He was born in Allegheny City, Pa., became a journalist and founded the *Evening Mail* in Pittsburgh. He started a monthly magazine in New Orleans; but the success of his first play, *Through Fire* (1871), induced him to devote himself to dramatic authorship. *My Partner* (1879) was his greatest success. He was for a time manager of the Fourteenth Street Theatre, New York. He became insane in 1886 and died in an asylum.

CAMPBELL, BEATRICE STELLA TANNER (1867—). An English actress, born in London, and married in 1884 to Patrick Campbell, who fell in the South African War in 1900. She was already well known as an amateur before she made her debut on the professional stage, at the Alexandra Theatre, Liverpool, in 1888. In March, 1890, she appeared in London at the Adelphi, where she afterwards played again in 1891-93, creating several parts. She gained a wide reputation in *The Second Mrs. Tanqueray* (1893) at the Saint James Theatre, where also she appeared in *The Masqueraders* (1894). As Kate Cloud in *John-a-Dreams*, produced by Beerbohm Tree at the Haymarket in 1894, she made another success, and again as Agnes in *The Notorious Mrs. Ebb Smith*, at the Garrick (1895). Among her later performances have been those in *Fédora* (Haymarket, 1895); Ibsen's *Little Eyolf* (Avenue Theatre, 1896); and notably in her Shakespearean revivals with Forbes Robertson at the Lyceum, as Juliet (1895), Ophelia (1897), and Lady Macbeth (1898). In 1900 she appeared in a revival of *Magda* at the Royalty Theatre. In the seasons of 1901-02 and 1902-03 she visited the principal cities of the United States, presenting her best-known rôles.

CAMPBELL, CHARLES (1807-76). An American historian, born in Petersburg, Va. He graduated in 1825 at Princeton, was head of a classical school at Petersburg from 1842 to 1855, and subsequently was principal of Anderson Seminary in the same city. He was a contributor to the *Southern Literary Messenger*, edited the *Orderly Book* of Gen. Andrew Lewis for 1776 (1860), and published *The Bland Papers* (1840-43), and *An Introduction to the History of the Colony and Ancient Dominion of Virginia* (1849).

CAMPBELL, Sir COLIN, Lord Clyde (1792-1863). A British field-marshal, born in Glasgow, Scotland, October 20, 1792. He was the eldest son of Colin MacIver, a carpenter. His maternal uncle, Colonel John Campbell, sent him to school at Gosport, and in 1807 introduced him to the Duke of York for an

army commission. The Duke mistook him for a Campbell, and his uncle hushed the boy's half-uttered protest with the remark, "It is a good name to fight under." He was gazetted as Colin Campbell, ensign, in 1808; served in the Walcheren expedition, 1809; and by 1813 attained a captaincy. He fought through the war in the Spanish peninsula with distinction; took part in the expedition to the United States in 1814; and afterwards spent nearly thirty years in garrison duty at various English stations. He served in China in 1842, and was present at the attack on Chusan. He next served in the Punjab, India, commanding the left at the battle of Chillianwallah, then for three years commanded in the Peshawur district with uniform success against the hill tribes. He was rewarded with the C.B. and K.C.B., and at the outbreak of the Crimean War in 1854 was appointed commander of the Highland Brigade. He took a prominent part at the battle of the Alma; and with the Ninety-third Highlanders, in the immortalized 'thin red line,' beat back the Russian cavalry in their attack on Balaklava. His services were rewarded with promotion to the rank of major-general; he was created a Knight Grand Cross of the Order of the Bath, and received the cross of the French Legion of Honor and other decorations. He was appointed inspector-general of infantry, and in 1857, at twenty-four hours notice, started for India to command the forces engaged in quelling the mutiny, which by his energy and judgment was soon utterly subdued, his relief of Lucknow being especially brilliant. A notable characteristic of Campbell's generalship was the care he took of his men, his victories being won with the minimum expenditure of the lives of his soldiers. For his exploits in India, Campbell, in 1858, was raised to the peerage as Baron Clyde, and the East India Company granted him an annuity of £2000. He returned to England in 1860, and in 1862 was made field-marshal. He died August 14, 1863, and was buried in Westminster Abbey. Consult Shadwell, *Life of Colin Campbell* (London, 1881).

CAMPBELL, DOUGLAS (1839-93). An American lawyer and historical writer, born in Otsego County, N. Y. He graduated at Union College in 1850, studied law at Harvard, served for a time in the Civil War as captain of the 121st New York Volunteers, and was admitted to the New York bar in 1866. After about twenty years of practice, he retired, partly on account of ill health, to devote himself exclusively to the study of American history, and published a book, *The Puritan in Holland, England, and America, an Introduction to American History* (2 vols., New York, 1892), which attracted considerable attention and has identified Campbell's name with the theory that the legal and political institutions of the United States were ultimately derived, not from England, but from Holland—directly through the Dutch settlers of New York and indirectly through the Puritans of Massachusetts, who, before coming to America, had spent some years in Amsterdam and Leyden. Though the book displays considerable erudition, its thesis has met with little support among historical scholars. Campbell also published two pamphlets entitled, *Historical Fallacies Regarding Colonial New York* (1879); and *The Origin of American Institutions as Illustrated in the History of the Written Ballot* (1891).

CAMPBELL, DOUGLAS HOUGHTON (1859-). An American botanist, born in Detroit, Mich. He graduated at the University of Michigan in 1882 (Ph.D., 1886), and afterwards took a supplementary course at Bonn, Tübingen, and Berlin (1886-88). In 1891 he became lecturer on the evolution of plants at Stanford University. His principal work is *Elements of Structural and Systematic Botany* (1890).

CAMPBELL, GEORGE (1719-96). A Scotch clergyman, born in Aberdeen. He was educated at Marischal College, studied divinity in Edinburgh and Aberdeen, and was ordained to the ministry in 1748. He was appointed principal of Marischal College in 1759; in 1771 was made professor of divinity there, and in 1795 retired from both posts. He is chiefly known for his *Dissertation on Miracles* (1762), a reply to Hume's essay (1748). His *Philosophy of Rhetoric* (1776) was also highly valued.

CAMPBELL, Sir GEORGE E. (1824-92). An English statesman. He was educated in Edinburgh, Saint Andrews, and Haileybury. In 1858 he was appointed judge of the High Court of Judicature in Calcutta, and in 1867 chief commissioner of the Central Provinces of India. He then served several years in Parliament, but in 1871 returned to India as Lieutenant-Governor of Bengal. In 1874 he went back to England to become a member of the council of India. He took an active part in the agitation on the Eastern question in 1876, as a supporter of the policy advocated by Mr. Gladstone. His more important books include *Modern India* (1852); *India as it May Be*; *Handy Book of the Eastern Question* (1876); *White and Black in the United States*; *The British Empire* (1889).

CAMPBELL, JAMES EDWIN (1843-). An American politician. He was born in Middletown, Ohio, was educated in the public schools, studied law, and in 1863 enlisted as a gunner in the navy, serving with the Red River and Mississippi flotillas. He was prosecuting attorney of Butler County in 1873, served in Congress as a Democrat from 1882 to 1888; and in 1889 defeated Joseph B. Foraker for the Governorship of Ohio. In 1891 he was defeated by William McKinley, and in 1895 by Asa S. Bushnell.

CAMPBELL, JAMES VALENTINE (1823-90). An American jurist, born in Buffalo, N. Y. He graduated at Saint Paul's College (College Point, L. I.) in 1841, and was admitted to the bar in 1844. Upon the establishment of the Michigan Supreme Court in 1857, he was appointed an associate justice. He was a professor in the law school of the University of Michigan from 1859 to 1885. His judicial decisions are highly valued. He edited Walker's *Chancery Reports* (1845), and wrote *Outlines of the Political History of Michigan* (1876), a subject in which he made much research.

CAMPBELL, JOHN (? -1806). A British soldier, born in Strachur, Scotland. He entered the army in 1745, and fought with distinction in the Scottish rebellion (1745), and in Flanders (1747). During the French and Indian War in America he served as captain of the Forty-second Highlanders, and was wounded at Ticonderoga (1758). As lieutenant-colonel of the Forty-seventh Infantry he again came to America with his regiment in 1776 and was successively appointed major-general (1779), colonel

of his regiment (1780), and commander of the British forces in West Florida, where he was eventually compelled to surrender Pensacola to the Spaniards, May 10, 1781. His advancement to the rank of general followed in 1797.

CAMPBELL, JOHN (1779-1861). Lord High Chancellor of England. He was the son of a Presbyterian minister of Cupar, County of Fife, Scotland, where he was born in 1779. He was at first destined for his father's calling, and was sent at an early age to the neighboring University of Saint Andrews. But he had no inclination for a clerical life, and, when he had completed his academic studies, at the age of 19, he went to London and engaged in newspaper work. At the same time he became a student in Lincoln's Inn, where he was a pupil of the distinguished special pleader Samuel Warren, and in 1806 was called to the bar. While waiting for clients he became a court reporter and published four volumes of reports with learned notes. Notwithstanding his good sense and remarkable industry, success at the bar came slowly, probably owing to a certain hardness of disposition and the lack of attractive personal qualities. It was not until he had been at the bar twenty-one years, in 1827, that he was made a King's counsel. From this time on, however, his promotion was rapid. In 1830 he entered Parliament, where his zeal, his capacity for hard work, and attention to details made him a valuable member and a useful supporter of the Whig Party. He devoted himself with characteristic energy and persistency to the amelioration of some of the harsh and cumbrous features of the law; and his name is associated with several beneficial statutes of this character. He failed, however, in his favorite project of bringing about a general registry of land titles in England, such as exists in the United States, and this reform still remains to be effected in that country. In 1827 he was made the head of the great Real Property Commission, which made a searching inquiry into the state of the real property laws of England, and whose reports and recommendations have proved of inestimable value to subsequent generations of law reformers.

Campbell was an ardent supporter of Lord John Russell's first Reform Bill in 1831, was made Solicitor-General in 1832, and two years later was knighted and promoted to the post of Attorney-General. In the same year he was chosen the representative in Parliament for Edinburgh. He continued to represent Edinburgh down to 1841, and remained in the office of Attorney-General during that period, with the exception of the short time in 1835 when the Conservatives were in power. In 1841 he was made Chancellor of Ireland and a peer of the United Kingdom with the title of Baron Campbell of Saint Andrews, but held the office of Chancellor for only a few months, when the Melbourne Cabinet left office, necessitating his resignation. For the first time since boyhood, he found himself without regular daily labor, and at the mature age of 60 set to work to win the literary fame which he professes always to have secretly coveted. His first publication was a collection of his speeches at the bar and in the House of Commons. For three or four years after the publication of his speeches Campbell was engaged in the preparation of the *Lives of the Chancellors*, the first series of which appeared in 1845. In 1846 he joined the

Russell Cabinet in the capacity of Chancellor of the Duchy of Lancaster. His ministerial duties were not sufficiently arduous to interrupt his literary labors, and he proceeded to complete the *Lives of the Chancellors*, and to publish a supplemental series of *Lives of the Chief Justices of England*. Both works have enjoyed great popularity, but leave no doubt that the author was more fitted for a practical lawyer than for a man of letters. Though executed in a sprightly manner, these writings are without grace of style and represent to a painful degree the envy, the prejudices, and the want of sympathy which were leading traits of Campbell's character. He returned to more congenial labors in 1850, when he was appointed to succeed Denman as Chief Justice. He held the office for nine years, at the end of which he received the Chancellorship of England. He died in June, 1861. His *Life* has been written by his daughter (1881).

CAMPBELL, JOHN (1840—). A Canadian scholar, born in Edinburgh, Scotland. He was educated at the University of Toronto and at New College, Edinburgh, distinguishing himself in both institutions. In 1868 he became minister of the Charles Street Presbyterian Church in Toronto, and in 1873 he was appointed professor of Church history and apologetics in the Presbyterian College, Montreal. He has contributed largely to learned societies and to Church reviews, and his work in theology and ethnology has been recognized both in America and in Europe. His chief single publication is *The Hittites: Their Inscriptions and Their History* (2 vols., 1890). For certain statements in an address on *The Perfect Father or the Perfect Book*, Professor Campbell was tried for heresy before the Presbytery of Montreal in 1893 and convicted. He, however, appealed to the Synod of Montreal and Ottawa and was sustained.

CAMPBELL, JOHN ARCHIBALD (1811-89). An American jurist. He was born in Washington, Ga.; graduated in 1826 at the University of Georgia, and was admitted to the bar in 1829. His legal ability was recognized by President Pierce, who, in 1853, appointed him associate justice of the United States Supreme Court, an office which he held until the outbreak of the Civil War. Subsequently he served as Assistant Secretary of War in the Confederate Government, and was one of the peace commissioners at the Fortress Monroe conference in 1865. After the war he was imprisoned at Fort Pulaski, but was released upon parole, and resumed his law practice.

CAMPBELL, JOHN FRANCIS, of Islay (*Iain Ieach*) (1822-85). A Scottish-Celtic scholar. He was born in Edinburgh, December 29, 1822, and was the eldest son of Walter Frederick Campbell and Lady Eleanor Charteris, eldest daughter of Francis, seventh Earl of Wemyss. He was educated at Eton and Edinburgh, and occupied several Government posts. He was a meteorologist of some distinction and invented an instrument for recording the intensity of the sun's rays. In 1865 he published *Frost and Fire, Natural Engines, Toolmarks and Chips, with Sketches Taken at Home and Abroad by a Traveler*, and in 1883 a book on *Thermography*. But he is chiefly remembered for his collections of Scottish Gaelic folk-tales and ballads. In 1860-62 he published his *Popular Tales of the West Highlands* in four

volumes, and in 1872 he brought out an important volume of Gaelic ballads under the title, *Leabhar na Feinne*. The tales were taken down conscientiously from the mouths of the people, and constitute the most valuable collection of the sort that has yet been made in any of the Celtic countries. The *Leabhar na Feinne* brings together all the accessible Scottish Gaelic ballads on Ossianic subjects. It was Campbell's intention to publish other volumes containing other cycles of ballads, but the plan was never carried out.

CAMPBELL, JOHN McLEOD (1800-72). A Scotch theologian. He was born at Kilninner, and studied in Edinburgh and Glasgow from 1811 to 1821, when he was licensed. He was inducted into the parish of Row in 1825, and after a trial by the Assembly for heresy in his doctrines regarding the Atonement, was deposed in 1831. From 1833 to 1859 he preached to an independent congregation in Glasgow. His chief work is the *Nature of the Atonement, and Its Relation to Remission of Sins and Eternal Life* (1856, 4th ed. 1873), which has had a more than slight influence upon Scottish religious thought. His further publications include *Thoughts on Revelation* (1862).

CAMPBELL, THOMAS (1777-1844). An English poet, born in Glasgow July 27, 1777. He was educated at the University of Glasgow, where he was distinguished for his knowledge of Greek literature. In 1795 he went as tutor to Sunipol on the island of Mull. The scenery of the western Highlands, which made a deep impression on his mind, is reflected in his verse. Returning from Mull, he repaired to Edinburgh with the intention of studying law. This plan he, however, soon abandoned for literature. His first poem, *The Pleasures of Hope*, suggested to him while at Mull, was published in 1799, and went through four editions in a twelvemonth. After its publication, Campbell went to Germany, visiting Munich, Leipzig, and Hamburg, where he was staying at the time of the battle of Hohenlinden. During this period he wrote *The Exile of Erin and Ye Mariners of England*. Returning to Edinburgh, he published, in 1801, *Lochiel's Warning and Hohenlinden*. In 1803 he proceeded to London, and adopted literature as a profession. In 1805, through the influence of Fox, he was granted a royal pension of £200 a year. In 1809 appeared *Gertrude of Wyoming*, which bears the same relation to *The Pleasures of Hope* that Thomson's *Castle of Indolence* bears to *The Seasons*—a less brilliant and striking, but more mature and finished performance. In 1819 he published his *Specimens of British Poets*, containing an excellent introductory essay on poetry, and good biographies of the poets themselves. At this very time he was also delivering lectures on poetry. After this he edited the *New Monthly Magazine*, contributing to it several poems, among which is *The Last Man*. In 1824 he published *Theodoric, and Other Poems*. In 1826 he was elected Lord Rector of the University of Glasgow, and he received the unusual honor of reelection in the two following years. He published *The Pilgrim of Glencoe and Other Poems* in 1842. His later publications added nothing to his fame. He died in Boulogne, France, June 15, 1844, and was buried in Westminster Abbey. Campbell's verse is unequal in quality, but it is usually

graceful. His lasting fame rests on *Hohenlinden* and the patriotic lyrics *Ye Mariners of England* and *The Battle of the Baltic*. Consult: Beattie, *Life and Letters of Thomas Campbell* (London, 1840); Redding, *Literary Reminiscences of Campbell* (London, 1860); *Poetical Works*, edited by Hill, with *Life* by Allingham (London, 1891).

CAMPBELL, WILLIAM (1745-81). An American soldier, prominent as a militia officer in the Revolutionary War. He was born in Augusta County, Va., and received a good education. In 1767 he removed to the Holston Valley with his mother and four sisters, and in 1773 became one of the first justices of the peace in Fincastle County. He served under Colonel Christian in Lord Dunmore's War (q.v.) in 1774, joined Patrick Henry's Virginia forces in September, 1775, and in July, 1776, assisted in forcing Governor Dunmore from Gwynn's Island. Returning to the Holston Valley, he became lieutenant-colonel of militia in 1777, was a member of the commission appointed in 1778 to run the boundary line between Virginia and the Cherokees in accordance with a recent treaty, and in the following year was prominent in various partisan operations against the Tories. He served for some time in the Virginia House of Delegates, but, obtaining a leave of absence in June, 1780, took an active part in numerous contests with the Tories, and in the famous battle of King's Mountain (q.v.) on October 7, was the leader of the American forces. Early in 1781 he joined General Greene, and on March 15 took a conspicuous part in the battle of Guilford Court-House (q.v.); but resenting the failure of Colonel Lee, commanding the cavalry, to come to his aid at a critical moment in this action, he withdrew in disgust from the service. He then again became a member of the House of Delegates, but in June was appointed brigadier-general of militia, and served under Lafayette until his death in August. Lafayette said of him: "The glory which General Campbell acquired in the affairs of King's Mountain and Guilford Court-House will do his memory everlasting honor, and insure him a high rank among the defenders of liberty in the American cause." Consult a sketch in Draper, *King's Mountain and Its Heroes* (Cincinnati, 1881).

CAMPBELL, WILLIAM, Lord (?-1778). The last English Governor of South Carolina, the youngest son of the fourth Duke of Argyll. He became a captain in the British Navy in 1762; was a member of Parliament in 1764, was Governor of Nova Scotia from 1766 to 1773, and in 1775 became Governor of the Province of South Carolina. Here, on the outbreak of the Revolution, he was active in stirring up the Indians against the Colonists, who forced him to take refuge on a British man-of-war. In 1776, during the British attack upon Fort Moultrie, he received a wound while aboard Sir Peter Parker's flagship, which afterwards resulted in his death.

CAMPBELL, WILLIAM WILFRED (1861—). A Canadian poet, born in Berlin, West Ontario. His father, Thomas Swainston Campbell, and his paternal grandfather were both clergymen of the Church of England. His mother was a daughter of Major Francis Wright, of Walworth Manor House, Surrey, England. Educated in Toronto and in Cambridge, Mass., Campbell was ordained

to the Episcopal ministry (1885), and after some experience in a New England parish, he became rector in Saint Stephen, New Brunswick (1888). In 1891 he resigned and removed to Ottawa, where he obtained a place in the civil service. In 1899 Campbell won attention by his fresh and musical *Lake Lyrics and Other Poems*. His way from descriptive verse to intenser lyrical expression is marked by *Beyond the Hills of Dreams* (1899). This volume contains several impassioned poems on patriotic and imperial themes; such as "Victoria," "England," "The World Mother," and "The Lazarus of Empire." Campbell has written a number of literary dramas, of which *Mordred* and *Hildebrand* were published together in 1895. See CANADIAN LITERATURE.

CAMPBELL-BANNERMAN, Sir HENRY (1836—). A British politician, representing the Sterling district, Scotland, since 1868, and since February, 1899, Liberal leader in the House of Commons. He was born September 7, 1836, and is the younger son of the late Sir James Campbell, of Stracathro, Forfarshire. His additional surname was assumed under the will of a maternal uncle, Henry Bannerman of Kent. He has received the M.A. degree from Cambridge and the honorary LL.D. from the University of Glasgow. Besides the county offices of justice of the peace and deputy lieutenant, he has held various positions in the Government. In 1871-74 and again in 1880-82 he was financial secretary to the War Office; secretary to the Admiralty, 1882-84; Chief Secretary for Ireland, 1884-85; and Secretary of State for War, 1886, 1892-93. In 1899 he was chosen leader of the Liberal Party in succession to Sir William Harcourt. In 1901 he became a member of the Civil List Committee.

CAMPBELL ISLAND. A lonely spot in the south Pacific, in latitude 52° 33' S. and longitude 169° 9' E. Though it is mountainous and measures only 36 miles in circumference, yet it is valuable on account of its harbors (Map: World, Western Hemisphere, P 2). It belongs to New Zealand, and is used as a provision depot, but is not permanently inhabited. It is also scientifically interesting, being volcanic, and displaying a rich and varied flora.

CAMPBELLITE. See CRAPPIE.

CAMPBELLITES, THE. (1) A religious denomination founded in the United States by the Rev. Alexander Campbell (q.v.). Once called the New Lights, they are still variously known as the Christian Church, the Church of Christ, and even the Reformers, though the name preferred by them is Disciples of Christ. (2) The followers of the Rev. John McLeod Campbell (q.v.), who in 1831, because of difference of faith about the Atonement, left the Church of Scotland. See DISCIPLES OF CHRIST.

CAMPBELTOWN. A royal burgh and seaport on the east coast of the peninsula of Kintyre, in Argyllshire, Scotland, 65 miles west-southwest of Glasgow, on a fine harbor or sea-loch (Map: Scotland, C 4). A sculptured granite cross stands in the principal street, and is supposed to have been brought from Iona. The town is famous for its whisky distilleries, and imports large quantities of barley. Coal is found in the vicinity. Its fisheries are important. Campbeltown is a favorite summer resort.

Population, in 1901, royal burgh, 5285; Parliamentary burgh, 8234; civil parish, 10,236.

CAMP-BIRD, or **ROBBER**. The Canada jay. See **JAY**.

CAMPE, kām'pe, **JOACHIM HEINRICH** (1746-1818). A German teacher, lexicographer, and writer for children. He studied theology in Halle, and became a warm partisan of the educational reforms of Basedow (q.v.), whose place he took during the year 1777 as the head of the Philanthropenum in Dessau. A little later he devoted himself to the writing of educational works, and also built up a prosperous business as a publisher of pedagogical works. In 1787 he was appointed to reform the system of instruction in the Duchy of Brunswick. In 1789 he visited Paris and became an ardent advocate of the principles of the Revolution. His juveniles, all written for the purpose of instruction, comprise thirty-seven volumes. His *Robinson der Jungere* ("Robinson the Younger") has been translated into many languages. He also published some lexicographical works.

CAMPEADOR, kām'pā-a-dōr'. An epithet used of warriors. In particular, a title of the Cid (q.v.).

CAMPECHE, *Mez. pron.* kām-pā'chā. One of the Atlantic States of Mexico, occupying the south part of the peninsula of Yucatan, and bordering on Guatemala and the Gulf of Campeche (Map: Mexico, O 8). Its area is 18,087 square miles. The soil is for the most part sandy and unproductive, but there are good pasture-lands. The main products are rice, sugar, and salt. Population, in 1879, 90,413; in 1895, 88,302. The Indians form a considerable portion of the population.

CAMPECHE, or **CAMPEA'CHY**. The capital of the Mexican State of the same name, and a seaport town, situated on the Gulf of Campeche, in the Gulf of Mexico, at the mouth of the San Francisco River (Map: Mexico, O 8). The industries of Campeche are unimportant with the exception of shipbuilding, but it is the centre of the trade in Campeche wood, and also in wax. Its harbor is sheltered by a breakwater, but is too shallow for vessels of deep draught. The town has a college and a population of 17,000.

CAMPEGGIO, kām-pēj'ō, or **CAMPEGGI**, kām-pēj'ē, **LORENZO** (1474-1539). An Italian prelate. In early life he was a lawyer, but after losing his wife he became an ecclesiastic and rapidly rose to the position of cardinal. In 1519 he was sent to England to preach a crusade against the Turks, but was unsuccessful. Henry VIII. made him Bishop of Salisbury in 1524, and he came again to England in 1528 to assist Wolsey in the case of Henry's divorce from Catherine. His efforts to bring about a reconciliation came to nothing, however, and the see of Salisbury was taken from him. At Nuremberg, in 1524, Campeggio tried to win back Luther to the Catholic Church. At the Diet of Augsburg, in 1530, he advised Charles V. to adopt a relentless policy toward the Protestants of Germany.

CAMP EQUIPAGE. Articles and materials necessary for the proper equipment of a camp. It includes, among other things, tents, furniture, fittings, cooking utensils, and articles of common use. The description and quantity of camp

equipment will depend on the purpose and location of the camp, its permanent or temporary character, and the number of troops accommodated.

CAMPER, kām'pēr, **PIETER** (1722-89). A Dutch anatomist and naturalist. He was born in Leyden, and studied medicine there. In 1750 he became professor in Franeker; in 1755 in Amsterdam; and in 1763 in Groningen, where he remained until 1773. On being elected a member of the State Council in 1789, he removed to The Hague, where he died. He was distinguished for the services he rendered both to human and comparative anatomy, to surgery, obstetrics, and medical jurisprudence, and was a skillful draughtsman. His collected writings, with plates, appeared under the title, *Œuvres qui ont pour objet l'histoire naturelle, la physiologie et l'anatomie comparée* (3 vols., Paris, 1803). For his observations on the facial angle, see **ANGLE**.

CAMPERDOWN (Dutch, *Camperduin*, Downs of Kamp). A broad tract of low downs which borders the North Sea on the west side of the peninsula which separates it from the Zuyder Zee (Map: Netherlands, C 2). It takes its name from the neighboring hamlet of Kamp, about 25 miles north of Haarlem. It gives its name to the victory obtained off that part of the coast by the British Admiral Duncan over the Dutch fleet, October 11, 1797.

CAMPERIO, kām'pā-rē'ō, **MANFREDO** (1826-99). An Italian traveler, born in Milan. He traversed Turkey, visited Australia and the Sunda Islands, and upon the opening of the Suez Canal explored the Nile as far as Assuan, went thence to the East Indies, Ceylon, and Java, and, in the service of the Society for the Commercial Exploration of Africa, founded by him in 1879, traveled through Tunis, Tripoli, and Bengasi. He established, in 1876, the review *Esploratore*. Besides articles in periodicals he published *L'Eritrea nel XX. secolo* (1899), in which he urges the necessity of railway construction in the colony.

CAMPERO, kām'pār'ō, **NARCISO** (1815—). A Bolivian soldier and politician, President of Bolivia from 1880 to 1884, born at Tojo (now in Argentina). He became a brigadier-general in the Bolivian Army, and for a brief period in 1872 was Minister of War. Upon the overthrow of Daza, he was elected President on April 9, 1880. He assumed command of the combined armies of Bolivia and Peru, but on May 26, 1880, was routed at Tacna. His administration, a tranquil one so far as concerned internal affairs, came to an end on August 1, 1884.

CAMP FOLLOWERS. Sutlers, servants, dealers in small wares, and sometimes natives of the vicinity, who travel with, or follow in the train of, an army on the march. They are invariably a source of trouble and responsibility to the commander of the army to which they attach themselves, and are often a source of danger.

They are not so much in evidence in modern campaigns as in the past, unless the campaign is being conducted in a wild or uncivilized country. Formerly, owing to the absence of railroads and steamships, armies had frequently to undertake long marches, with practically no base of supplies, or at the best having very meagre communication with such base, rendering necessary the carrying of great quantities of stores and supplies. Natives were employed for this

work, and in instances where the roads were to be constructed or were in need of repairs, would also be used for that purpose. It is recorded that in February, 1830, when a Bengal army of 15,000 men left Shikapur for Afghanistan, it was accompanied by at least 85,000 camp followers.

In European countries, and in modern times, the presence of railroads, obviates a certain amount of marching, and in conjunction with steamships keeps the army well supplied, rendering any large number of camp followers unnecessary. Those who do exist, however, are provided for in regulations, are subject to the articles of war, and are under the control of the commanding officer.

CAMPHAUSEN, kâmp'hou-zen, OTTO (1812-96). A Prussian statesman. He was born in Hünshoven, studied at the universities of Bonn, Heidelberg, Munich, and Berlin, in 1844 was elected councilor at Treves, and in 1845 became a member of the Ministry of Finance. In 1869 he was appointed Finance Minister. His administration, resourceful and cautious, marked a change from conditions of economic depression to those of great prosperity. Made accountable by his opponents for a subsequent reaction, attacked by even the Liberals, and at odds with Bismarck respecting the tobacco tax, he resigned with rank of Minister of State.

CAMPHAUSEN, WILHELM (1818-85). A German painter. He was born in Düsseldorf, and was a pupil at the academy there. His specialty was battle scenes. Among his works are: "Tilly at Breitenfeld" (1841); "Prince Eugene at Belgrade" (1843); "Godfrey of Bouillon at Ascalon" (1845); "Puritans Watching the Enemy" (1846); "Charles II. in the Retreat from Worcester" (1849); "Charles I. at Naseby" (1851); "Blücher Meeting Wellington" (1857); "Napoleon III. at Sedan"; "Meeting Between Bismarck and Napoleon III.," and "Entry of Emperor William into Berlin" (1872). Camphausen was professor at the Düsseldorf Academy from 1859 until his death.

CAMPHENE, kâmp-fên' (*Camphor* + *ine*). The name applied to purified oil of turpentine, which has been used for burning in lamps. It is very volatile, and burns very freely, giving a white, brilliant light. With air its vapors form a dangerously explosive mixture.

CAMPHOR (Med. Lat. *camphora*, from Ar. *kâfur*, camphor, which is derived through the Prakrit *kâpûra*, from Skt. *karpûra*, camphor), $C_{10}H_{16}O$. A substance obtained by the action of steam on the chipped wood of the camphor-tree (*Camphora officinarum*, or *Cinnamomum camphora*, Nees). The product of distillation with steam is freed from volatile oil by draining and pressing, and the crystalline mass remaining behind is purified by sublimation. Camphor has also been prepared artificially by oxidizing the hydrocarbon camphene, $C_{10}H_{16}$. Pure camphor is a colorless, transparent, crystalline substance, melting at $175^{\circ}C$. and boiling at $204^{\circ}C$. It has a characteristic odor and a somewhat pungent, aromatic taste. It is only sparingly soluble in water, but dissolves readily in alcohol, ether, chloroform, carbon disulphide, and other organic liquids. It has a tough consistency, but if digested with alcohol becomes hard and may then be readily pulverized. Camphor was introduced

into Europe by the Arabs. It is now employed in the manufacture of celluloid and of explosives, and is often used in medicine. It forms an ingredient of various liniments and is often applied externally in gout and chronic rheumatism and to relieve pain in neuralgia; it is commonly administered internally as a remedy for a catarrhotic cold in the head. It is generally known as *common* or *Japan camphor*. Borneol, or Borneo camphor, is described in a separate article.

CAMPHORIC ACID, $C_8H_8(COOH)_2$. An organic substance obtained by the oxidation of camphor with nitric acid. It occurs in needle-shaped crystals, colorless, odorless, and of slightly acid taste. It is nearly insoluble in cold water, but dissolves readily in hot water as well as in alcohol, ether, fatty oils, and other organic liquids. Camphoric acid has been used in inflammatory conditions of the respiratory and urinary mucous membranes, but is now employed almost exclusively as an anhidrotic (q.v.). It proves most serviceable in the profuse night-sweats of phthisis.

CAMPHUYSEN, kâmp'hoi-zen, DIRK RAFFELSZ (1586-1627). A Dutch theologian and poet, born at Gorkum. He was a partisan of Arminius and was persecuted on that account. Among his works is a compendium of his doctrines. He also left a number of religious poems, including a translation of the Psalms. He is said to have been a painter until his eighteenth year. The pictures attributed to him are probably by his nephew, RAPHAEL CAMPHUYSEN (1598-1657), an artist, or by his other nephew, Raphael's brother, GOVAERT CAMPHUYSEN (1624-74), a painter. His works usually are landscapes with animals done in Paul Potter's style, and have been taken for that master's. They are to be found in Dutch museums and in private collections.

CAMPI, kâmp'pé, ANTONIO, BERNARDINO, GIULIO, or VINCENTO. See CAMPI, GALEAZZO.

CAMPI, GALEAZZO (1475-1536). An Italian artist, born in Cremona. He was the founder of a family of painters, but attained little reputation himself. His son GIULIO, however, born in Cremona (1500-72), and pupil of Giulio Romano, led the Eclectic School in seeking to unite the best qualities of the Roman and other Italian schools. He studied the works of Titian, Raphael, and Giorgione, and his paintings are remarkable for vigor and beauty of coloring. His best works are in Cremona, Milan, and Mantua. Of the brothers whom he instructed, ANTONIO CAMPI excelled also as an architect; his best picture, that of "Saint Paul Resuscitating Eutychus," was engraved by Agostino Caracci.—VINCENTO CAMPI, who died in 1591, devoted himself to pictures of still life, but his work was much inferior to that of his brothers.—BERNARDINO CAMPI, a third brother, was born in Cremona, 1522, and died about 1592. He was also a pupil of Giulio and the greatest of the Campi. He was later instructed by Ippolito Corta, and then went to Parma and Modena to study the style of Correggio. He had wonderful skill in imitating the works of Titian. Of his original work, the best representation is a painting in the Church of San Gismondo in Cremona. Of the Cremonese artists of their time, the Campi ranked first, though their style was mainly mechanical.

CAMPIDOGGIO, kām'pé-dō'lyō (It., Capitoline Hill, Lat. *Capitolium*). The Piazza di Campidoglio, with the famous group of palaces erected from Michelangelo's designs, occupies a depression on the Capitoline Hill in Rome between the two peaks of the Citadel and the Temple of Jupiter. The edifices consist of the Palace of the senator, opposite the grand flight of steps leading up from the Piazza Araceli, and the Palace of the Conservators and the Capitoline Museum on either side. In the centre of the Piazza di Campidoglio stands a splendid antique equestrian statue in bronze of the Emperor Marcus Aurelius.

CAMPINAS, or **SÃO CARLOS DE CAMPINAS**, soun kār'lōs dā kām-pé'nās (Portug., lains). A town of Brazil on the Piracicaba, 70 miles northwest of São Paulo (Map: Brazil, H 1). There are large coffee and sugar plantations in the surrounding district. Population, 12,000.

CAMP'ION. See LYCHNIS; SILENE.

CAMP'ION, EDMUND (1540-81). An English Jesuit. He was born in London, was educated at Oxford, and in 1567 was ordained a priest, but as he could not consent to the Protestant formulary as required by the English church, he went to Ireland, where it was expected that the University of Dublin would be revived. That plan failing, he went (1571) to Louvain, and there joined the Society of Jesus (1572). In 1580 he returned to England as a missionary. The next year he published *Decemnationes*. For this he was arrested, committed to the Tower, tortured several times on the rack, subjected to prolonged disputations, for which he had no time to prepare himself and could see no books, was tried for treason and convicted by hired witnesses, and was hanged at Tyburn, London, with several laymen. Consult Simpson, *Edmund Campion: A Biography* (London, 1867).

CAMPION, THOMAS (?-1619). An English poet and musician, about whose life almost nothing, not even the date of his birth, is known. He appears to have traveled on the Continent, and to have received the degree of M.D. in a foreign university. In 1595 he published a volume of Latin elegiacs and epigrams, under the title *Poemata*. He ridiculed rhyme in the *Art of English Poesie* (1602); composed many masques for the Court of King James I., and became an authority on music, publishing four books of airs, songs with accompaniments (1610-20). For his masques, consult Nichols, *The Progresses*, etc., of Queen Elizabeth and of King James I. (London, 1788-1828).

CAMPISTRON, kām'pés'trōn', JEAN GALBERT (1656-1723). A French dramatic poet. He was born in Toulouse, and at an early age went to Paris, where he became a follower of Racine. His works have neither well-marked character nor striking situations, but many of his tragedies were produced with success for several years. Among his best-known works are *Virginie* (1683); the libretto for Lully's opera, *Acis et Galatée* (1686); *Andronic* (1685), which has the same historical background as Schiller's *Don Carlos*; and *Tiridate* (1691). The best edition of his works is that of 1750 (3 vols.), which contains memoirs of his life. *Œuvres choisies* (Paris, 1810) were published by Auger. In 1701 he was received into the French Academy.

CAMP-MEETING. A series of religious meetings held in the open air, usually in the woods, and participated in by families or groups of persons from a distance, who live in tents or in simply built houses during the sessions and devote the greater part of the time to listening to preaching, which is always direct and fervent and is usually accompanied by a 'revival.' The first held in the United States was in 1799, at a settlement on Red River, in Kentucky, and was the outcome of the preaching of Rev. John M'Gee, a Methodist, his brother, a Presbyterian, and Rev. Mr. Hoge, also a Presbyterian, at a communion service. Their exhortations affected their audience so strongly that crowds came from the surrounding country to hear confessions and 'testimonies,' and the meeting, transferred from the small meeting-house to the adjoining forest, was protracted for several days, and was followed by others in different places. The number of persons attending one camp-meeting in Kentucky was estimated at 20,000. At first Presbyterians and Baptists united with the Methodists in holding these meetings, but they soon came to be confined to the last-named denomination, which in all its branches has been most enthusiastic in supporting them and in introducing them into all parts of the country, though even within the denomination they have met with opposition. In many States camp-meetings have lost some of the characteristics of early days, the places of meeting being fixed, and the life less simple. Not unfrequently secular instruction is a feature, schools of languages, music, art, etc., and lectures on various topics, filling the time not occupied by religious services. Among the many popular camp-meeting grounds of the Methodist Episcopal Church are Round Lake, N. Y., Ocean Grove, N. J., Martha's Vineyard, Mass., Lakeside, Ohio, Bartley, Neb., and Pacific Grove, Monterey, Cal.

Lorenzo Dow (q.v.) introduced camp-meetings into England in 1807, but the Wesleyan Conference refused (as it still does) to sanction them, and to this attitude was partly due the organization of the Primitive Methodist denomination in 1810. Consult: *An Essay on Methodism* (New York, 1849); J. Porter, *Revivals of Religion* (1877); S. C. Swallow, *Camp-Meetings* (1878).

CAMPOAMOR Y CAMPOOSORIO, kām'pō-á-mōr' é kām'pō-ó-sō-ré-ó, RAMON DE (1817-1901). A Spanish poet, politician, and philosopher. He was born in Navia, September 24, 1817, and received a classical education in Santiago and at the Jesuit College of Saint Thomas in Madrid, which he left without finishing his course. He then began the study of medicine at the College of San Carlos, but abandoned it to devote himself to journalism and literature. Throughout his life, however, he kept a strong interest in physiological and physical science, and especially in chemistry. He entered political controversy with the *Historia crítica de las Cortes reformadoras* in 1837; was several times elected to the Cortes, where he distinguished himself as an orator; was appointed Governor of Alicante and Valencia in 1854; and engaged in a long controversy with Castelar which is represented by his *Polémicas con la democracia* (1862). He took no part in politics from the Revolution of 1868 until the succession of Alfonso XII. in 1874, after which he held several subordinate offices, was made counselor of state, and later life Senator. He

refused the title of Grande de España. His attitude in politics was always that of a moderate conservative, distinguished for his eloquence and his chivalric faithfulness to the royal family.

His trend toward philosophical thought was shown in *La filosofía de las leyes* (1846), and confirmed in *El personalismo* (1850 and 1855); he attempted to expound his system in *Lo absoluto* (1862 and 1865) and *El idealismo* (1883), the two works by which he is best known outside of Spain. His philosophy is a somewhat incoherent and often self-contradictory eclecticism, tending on the whole to subjective idealism.

By far his most important work was done in poetry. Lightness, grace, and delicate sensibility marked his early verse: *Los ayes del alma* (1842), and *Ternezas y flores* (1858). The *Fábulas morales y políticas*, first published in 1842, were added to in many successive editions. His most characteristic short poems are to be found in the *Doloras* (1856-90, 18 editions, each containing new work), which created a new type of poem much imitated by the younger Spanish poets. These poems condensed into brief lyric form the expression of philosophical, ethical, and social ideas, treated sometimes with bitter irony, but always with feeling. He attempted long narrative poems in his epic on Columbus (*Colón*, 16 cantos, 1853 and 1857), and *El drama universal* (1873), but these are less successful than the shorter narratives, which contain some of his best work: *Los pequeños poemas* (1879, 1886); *Los buenos y los sabios* (1881); *El amor y el río Piedra* (1882); *Los amores de Juana* (1882); *El trén express* (1885); *Nuevos pequeños poemas* (1887); *Humoradas* (1890). *La niña y el nido*, *Los grandes problemas*, and *Por donde viene la muerte*, are among the best. He also wrote many plays in verse, none of which succeeded on the stage. They are full of humor and feeling, and rich in ideas, but are lacking in dramatic movement. The best known are: *Una mujer generosa* (1838); *Dies Irae* (1873); *El honor* (1874); *Guerra á la guerra*; *Así se escribe la historia* (1875); *Glorias humanas* (1885); *Cuérδος y locos* (1887); *El Palacio de la verdad*, etc. He published his theory of poetry in *La poética* (1883), completed in a new edition (1890), and in *La metafísica y la poética* (1891). His last poems of importance are *El licenciado Torralba*, a philosophico-ethical narrative poem, and *Nuevos poemas* (1892). He became a member of the Spanish Academy in 1861.

Campoamor's narrative poetry at its best may be compared with that of Victor Hugo. In his usual choice of subjects he rather resembles Copée, to whom, however, he is distinctly superior in conception and treatment. In poems of sentiment and thought, such as the *Poesías y fábulas*, and the *Doloras*, he has close affinity with Sully-Prudhomme, and the *Licenciado Torralba* attempts the same task as Sully-Prudhomme's *Bonheur*. In spite of these relations, he is the most original and independent of Nineteenth Century Spanish poets, and is by many considered the greatest of the last half-century. He is the poet of subjectivity *par excellence* in all Spanish poetry, and finds fit lyric expression for thought as do few poets of any country.

His *Obras completas* were edited by Montaner y Simon (Barcelona). Selections from his poetry were published (Madrid, 1879, and Leipzig, 1885). Consult: Juan Valera, *Estudios Críticos*

(Madrid, 1864); Fr. Giner, *Estudios literarios* (Madrid, 1866); Melchior de Palau, *Acontecimientos literarios* (1889).

CAMPOBASSO, kām'pò-bàs'sò (It. *campo*, Lat. *campus*, field + *basso*, Late Lat. *bassus*, low). A city in South Italy, capital of the Province of Campobasso, 52 miles north of Benevento, on the east slope of Monteverde, in the heart of the Apennines, 2400 feet above the sea (Map: Italy, J 6). The climate is cool and healthy and the town has a ruined castle and walls, a cathedral, a theatre, excellent institutions of learning, important manufactures of cutlery, and a famous market to which good roads lead from the surrounding country. Population, in 1881, 15,000; in 1901, 15,030.

CAMP OBEL/LO (It. *campus*, Lat. *campus*, plain + *bello*, Lat. *bellus*, beautiful). An island of New Brunswick, Canada, situated just outside of the Maine, United States, boundary, at the mouth of Passamaquoddy Bay, an inlet of the Bay of Fundy, in latitude 44° 57' N., and longitude 66° 55' W. (Map: New Brunswick, C 5). The island, from nine to ten miles long, and from two to three miles wide, has a picturesque coast abounding in fiords, chasms, cliffs, and pleasant beaches. At the north end is a lighthouse 60 feet in height. The well-wooded interior is intersected in all directions by fine walks and drives. It contains copper and lead ores, but the industrial portion of the population is chiefly engaged in fisheries, and during the season in attending to the wants of the residents of the numerous summer homes and hotels, some of the best along the Atlantic coast. The island's development dates from its acquisition by a syndicate of Boston and New York capitalists in 1880. From 1767 it had been in the possession of Admiral William Owen's family. The United States is represented by a consular agent. Permanent population about 1206.

CAMPO-FORMIO, kām'pò fôr'myò, now officially written CAMPOFORMIDO. A village in the Province of Udine, northern Italy, about 7 miles southwest of the city of Udine. It is celebrated for the treaty of peace concluded there, October 17, 1797, between Austria and the French Republic. After overrunning Italy, Bonaparte had crossed the Alps, and threatened Vienna. Austria therefore hastened to arrange preliminaries of peace at Leoben, April 18, 1797. In the treaty which was concluded by Bonaparte with the Count von Cobenzl at Campo-Formio, Austria ceded the Belgian Netherlands to France, and gave up Lombardy, to be incorporated into the Cisalpine Republic, and received as compensation most of the territories of the Republic of Venice (which Bonaparte had extinguished), including Venetia (with the city of Venice), Venetian Istria, and Dalmatia. France took the remaining territory of Venice, its possessions in Albania, and the Ionian Islands.

CAMPO MAJOR, kām'pò má-zhōr'. A city in the Province of Alentejo, Portugal, 11 miles northeast of Elvao (Map: Portugal, B 3). It is situated at an elevation of about 950 feet, has a meteorological observatory and manufactures wine and woolen goods. It was the scene of a siege in 1811 during the Peninsular War, which has been celebrated by Scott. Population, in 1890, 5846.

CAMPOMANES, kām'pō-mā'nās, PEDRO RODRIGUEZ, Count (1723-1802). A Spanish statesman and political economist. He was born in Asturias. His talents and learning were devoted to the advancement of his native country. He acquired a high reputation for legal attainments and was appointed fiscal and subsequently president of the Supreme Council of Castile. He held other high offices, among them that of director of the Royal Academy of History in Madrid. By his enlightened view of state policy as well as by his writings, which gave him a place among the most eminent Spanish authors, he obtained a great reputation throughout Europe. His attention was chiefly devoted to economic studies. He pointed out how the impoverishment of Spain was due to oppressive laws, that tended to discourage commerce and industry. He gave effectual assistance to Count Aranda in his difficult enterprise of driving the Jesuits out of Spain. Campomanes was a man of great intelligence and the highest probity, and gained the affection and admiration of all his associates. At the suggestion of Benjamin Franklin, Campomanes was chosen an honorary member of the Philosophic Society of Philadelphia. His chief works are: *Antigüedad marítima de la república de Cartago* (Madrid, 1756); *Discurso sobre el fomento de la industria popular* (1771); *Discurso sobre la educación popular de los artesanos* (1775); and *Tratado de la regalía de amortización* (1765).

CAMPORI, kām-pō'rē, CESARE, Marquis (1814-80). An Italian historian, born in Modena. His masterpiece is the exhaustive biography, *Raimondo Montecuccoli, i suoi tempi e la sua famiglia* (Florence, 1876). A collection of his works was published posthumously under the title of *Memorie patrie, storiche e biografiche* (Modena, 1882). Consult Matteo Ricci, "Cesare Campori," in *Ritratti e profili politici e letterari* (Florence, 1880).

CAMPOS, kām'posh (Portug., plains, Lat. *campus*, field). A city of Brazil, in the State of Rio de Janeiro, on the Parahyba River, which is navigable for small steamers to this point, about 30 miles from its mouth (Map: Brazil, J 8). It has good railroad connections, and canals extend to the coast. The city is lighted by electricity and contains several fine buildings. It controls an important trade as the centre of a fertile region producing sugar-cane, coffee, rice, and cotton, and has a number of sugar-refineries. Campos was founded in 1730. Population, in 1890, 78,036, one-half of whom are negroes.

CAMPOS. The Brazilian term for tropical prairies or savannas. Campos in which trees are common are called 'campos cerrados.' See GRASSLAND and SAVANNA.

CAMPOS, ARSENE MARTINEZ. See MARTINEZ CAMPOS.

CAMPO SANTO, kām'pō sām'tō (It. *campo*, Lat. *campus*, field + *santo*, Lat. *sanctus*, holy). The Italian designation of a cemetery or burying-ground, but more especially for an inclosed place of interment, surrounded internally by an arcade, for the burial of persons of distinction. See CEMETERIES.

CAMPOS SALLES, kām'posh sā'lēsh, MA-NOEL FERRAZ DE (1841—). A South American politician, and President of Brazil, born in São Paulo. He was admitted to the bar, was

elected in 1867 and frequently thereafter to the Legislature of São Paulo, and in 1884 became a member of the Chamber of Deputies. As Minister of Justice, upon the proclamation of the Republic, he thoroughly reorganized the Brazilian system of law along lines subsequently accepted by the Constituent Assembly. In 1898 he was elected President of Brazil, as candidate of the Republican Party.

CAMPO VACCINO, kām'pō vá-chē'nō. See FORUM ROMANUM.

CAMPRODON, kām'prō-dōn', FRANCISCO (1816-70). A Spanish dramatic poet. He was born at Vich, Barcelona, and first attracted attention by his poem *La Tornado de Titó*, written in the Catalan dialect, upon the return of the Spanish Army from the African War. Some of his dramas are adaptations from foreign works. The most important original one is *Flor de un día* (1851).

CAMPTONITE (named after Campton, N. H., where the first specimen was found). A term applied to certain igneous rocks of the nature of diorite, which occur in fissures in other rocks—i.e. in dikes. They are composed chiefly of hornblende and plagioclase, the former mineral being sometimes replaced by biotite. Iron ores and quartz are also usually present. The chemical composition of camptonite does not differ from that of diorite.

CAMP'TOSAURUS (Neo-Lat., Gk. *καμπτός*, *kamptos*, bent + *σαῦρος*, *sauros*, lizard). A genus of herbivorous, bird-footed dinosaurs of which remains are found in the Jurassic rocks of Wyoming. The genus is closely allied to the fossil genus *Iguanodon* of the European Jurassic, which it much resembles. The animal was lightly built, and as its five-toed fore limbs were small and apparently of little use in locomotion, it must have progressed on its three-toed hind limbs after the fashion of a bird. Its neck was rather short, but slender and bird-like, and its small head was provided with a horny beak. The tail was long and heavy. Three species have been recognized; of these the largest, *Camptosaurus amplius*, had a length of 30 feet and a height of 15 feet. See DINOSAURIA.

CAMPULUNG, kām'pōō-lōōng', or KIMPO-LUNG. A town of Rumania, capital of a circle, situated on a small tributary of the Arjish. It forms the terminus of the railway line from Coleschi and had a population of 13,033 in 1899.

CAMPUS (Lat., field). In Roman times, a vacant space in or near a city, used for public shows, combats, etc. There were eight around Rome, of which the Campus Martius (Field of Mars) was the most important. It was outside the walls, occupying the level space between the Pincian, Quirinal, and Capitoline hills on the east, and the Tiber on the west. In later times this space was much reduced by private buildings, and the name was limited to the space between the river, the Circus Flaminius, and the Via Iata. In this met the *Comitia Centuriata* and the *Comitia Tributa*; and in it was the public hall for the use of the magistrates and foreign ambassadors, who were not permitted to enter the city, and the *Ara Martis* (Altar of Mars). In later times it became a pleasure ground, with shaded walks, gardens, baths, theatres, and a race-course. Julius Cæsar began the change, by

erecting a stone building for the voting of the people, but Agrippa did most for the place by erecting many structures, among them his baths and the original Pantheon; and Augustus added his own mausoleum and the Ara Pacis. Later emperors crowded this particular campus with public buildings and private residences. It was certainly not within the *pomerium* before the time of Hadrian, but whether it was included by him or by Aurelian is uncertain. The district in which the old Campus was situated is now called Campo Marzo. Another ancient campus was the Sceleratus, the polluted field, where Vestals who had been untrue to their vows of chastity were buried alive. The open grounds around American colleges often bear the name of campus.

CAMPUS ESQUILINUS. A tract of land outside of the Servian agger at Rome, once used as a burial-place for slaves and the lower classes, whose bodies were thrown into common pits. Its unsanitary condition made it a menace to the city, and the cemetery was suppressed under Augustus. Mæcenas covered the whole region with clean earth to the depth of 25 feet, and on the new-made land laid out his famous gardens.

CAMPVERE, kâmp-vâr, now called VERE, VEERE, or TER-VERE. A small fortified town of the Netherlands, situated on the eastern coast of the island of Walcheren, in the Province of Zeeland, 4 miles northeast of Middelburg (Map: Netherlands, B 3). The town has fallen into decay; but its former prosperity is indicated by the town-hall of white freestone, with an elegant tower, and by the large and beautiful cathedral, which is no longer used. The town has some historical interest. It was the first to proclaim William III., Prince of Orange, General Stadtholder. The town effectually repelled the attack of the Spaniards in 1572.

CAMTOOS (kâm-tôs' or kâm-tôôs') **RIVER.** See GAMTOOS.

CAMUCCINI, kâ'mûč-ché'né, VINCENZO (1775-1844). An Italian painter, born in Rome. His first instruction was received from his brother, but afterwards he became a pupil of Corvi. He studied the works of Raphael and Domenichino; but it was the arrival in Rome of the French artist David that stimulated him to the work of painting in a classic manner subjects from Roman history. His "Romulus and Remus" and the "Death of Cæsar" were produced at this time. Among his works extant in Rome are "The Incredulity of Saint Thomas" (in mosaic at Saint Peter's), and "The Conversion of Saint Paul." Camuccini was made a member of the Institute of France, and Francis I., of Austria, bestowed on him the Order of the Iron Crown. As a man of superior taste and considerable fortune, Camuccini devoted himself to collecting pictures and objects of art, and in 1856 seventy of the pictures of his collection were purchased by the Duke of Northumberland. The "Madonna with the Pink," by Raphael, was the most important of them.

CAMUS, kâ'mû' or kâ'mûs', ARMAND GASTON (1740-1804). A French politician, born in Paris. His legal ability and radical zeal brought him into prominence after 1789. He secured and published the so-called 'Red Book,' which contained a damaging record of Court extravagance. He was, as member of the Convention, the most emphatic opponent of all secret orders and ecclesi-

astical privileges. In 1793, while attempting to capture Dumouriez, who was charged with treason, he was himself captured. After two years and a half, the Austrians exchanged him for the daughter of Louis XVI., and on his arrival in Paris he evoked a great deal of sympathy by recounting the hardships of his confinement. The Council of Five Hundred made him a member by legislative enactment, and subsequently he became president of that body. His best service was performed when, as conservator of the national archives, he preserved from destruction the old documents of the abolished corporations and institutions. He wrote a number of valuable legal works. He died November 2, 1804.

CAM'WOOD (African *kambe*, native name for the tree + Eng. *wood*), or BARWOOD. A dye-wood which yields a brilliant but not permanent red color, and is used with sulphate of iron to produce the red color in English bandanna handkerchiefs. It is the wood of *Baphia nitida*, a tree of the order Leguminosæ, a native of Angola. It is preferred to brazilwood, as producing a finer and richer red.

CANAAN, kâ'nân (Heb. *Kana'an*, Gk. *Χανααν*, *Chanaan*, perhaps from Heb. *kana*, to be low). According to Hebrew tradition, a son of Ham. Gen. x. 6. The curious story is told of him in Gen. ix. 22-27, that he was cursed because of a wrong done not by him, but by Ham to Noah. The latter, becoming drunk with wine, lay uncovered in his tent. Ham saw his father's nakedness, and told his brothers, Shem and Japheth, who covered their father with a garment, walking backward so that they might not see their father in an exposed state. Since it was Canaan who is cursed, and not Ham, it is claimed by many Bible critics that the story was originally told of the former, and the story itself is said to illustrate the opposition to agriculture, of which there are other traces (see article ABEL) in the Old Testament traditions, and also reflects the hostility of the Hebrews to their bitter enemies, the Canaanites. It is also claimed that in an older tradition, woven into the Pentateuch, the three sons of Noah were Shem, Japheth, and Canaan, the first representing the Hebrews, the second a people adjacent to the Hebrews (perhaps the Phœnicians), and Canaan the Canaanites. Subsequently, when the tradition became enlarged to represent all peoples known to Hebrew writers, Ham took the place of Canaan and became the general designation for nations hostile to the Hebrews. (See HAM; JAPHETH.) Canaan, in reality, is merely the eponymous ancestor of the Canaanites, and is also the common designation in the Old Testament for the land to the west of the Jordan, conquered by the Hebrews between the Thirteenth and the Eleventh centuries B.C. It should, however, be stated that the term is used rather indefinitely, and is sometimes made to include territory to the east of the Jordan, since that too was in part settled by the Hebrew clans. To the west of the Jordan the term is extended to include Philistia (e.g. Zeph. ii. 5) and Phœnicia (e.g. Isa. xxiii.), though in general it is limited to the territory actually occupied by Hebrew settlements, that is, the later kingdoms of Judah and Israel.

From the Egyptian inscriptions, in which the name Ka-n-na appears as early as B.C. 1800, it is evident that Canaan was originally applied to the Phœnician coast (including Philistia) and

from the coast came to be extended to the interior. The etymology of Canaan is not certain, but it is just possible that it designated the 'low' land, since in Egyptian inscriptions the article is attached to the term, and in some Semitic languages the stem *Kana* has the sense of low. There are good reasons for believing that already at a very early period the population of Palestine represented a mixture of races. The oldest known to us are the Amorites, the Anakim, and the Rephaim. These seem to have preceded the Canaanites proper, whom the Hebrews encountered. They were powerful warriors and later tradition represents them as endowed with gigantic strength and of great stature. At the time that the Egyptian rulers began their campaigns for the possession of western Asia (B.C. 1800), the country is already well settled and the existence of numerous towns points to the presence of a civilized population, such as we find at the time of the Hebrew conquest. For several centuries Egypt remained in control, but prior to this period Babylonian influence had been dominant in the country. Whether the country was actually controlled by Babylonian or Assyrian monarchs or not, it is noteworthy that the script and language used by the governors stationed in Palestinian towns in corresponding with Egypt, as is shown by the Amarna cuneiform documents (about B.C. 1400), was the Babylonian. From the letters that passed between Egyptian officials and their royal masters we learn, among other things, that such towns as Jerusalem, Bierut, Byblos, Sidon, Simyre, etc., were already in existence, and there are also indications that in the Fifteenth Century B.C. some of the clans which afterwards were included in the confederacy of the Bene Israel were already in the land, showing, what we know from other sources, that not all of the Hebrew tribes had preceded to Egypt. In the Fifteenth Century, however, the Egyptian control, as these Amarna tablets show, was beginning to show signs of weakness and the rise of Assyria proved a serious menace to Egyptian supremacy. The internal disturbances in Egypt were another factor which led to the loss of Palestine and Syria, so that when the Hebrew confederacy came into existence about the middle of the Thirteenth Century and the plan was formed to drive the Canaanites out of their possessions, Egypt neither offered any resistance, nor do we hear of their coming to the aid of the Canaanites. The Hebrew conquest was not accomplished at one stroke. It was a gradual displacement of the agricultural population, who were reduced to the grade of dependent serfs where they were not driven out. By the Eleventh Century the conquest may be regarded as complete and for the succeeding three centuries Israel remains in undisputed possession, though threatened at times by Egypt and involved in more or less constant warfare with the Philistines to the west, and with Moab, the Ammonites, and the Edomites to the east and south.

From the Ninth Century the Assyrian rulers pursue a more energetic policy, and as a result, the northern kingdom of Israel falls into their hands (about B.C. 722) together with the Phœnician coast, while the southern portion of Canaan becomes tributary to the great power. A century later the new Babylonian Kingdom accepts the legacy of Assyria, and in 597 Canaan passes into the hands of Nebuchadnezzar II. Persia succeeds

Babylonia as a world power and Canaan remains in a position of dependence. Nor is the situation improved with Alexander the Great. The Hebrews, while permitted to exercise certain authority, are under the control of the Greek satraps, and when Greece yields to Rome, Canaan, now known as Palestine from the designation Philistia, given to the southern seacoast, becomes a Roman province. From the beginning of our era to the present time, Canaan has been one of the great battle-fields of the world, one which the conflicts between the Orient and the Occident for supremacy have been waged.

See CANAANITES; CRUSADES; ARABIA; TURKEY; SYRIA; and for the geography, fauna, and flora of Canaan, the article PALESTINE.

BIBLIOGRAPHY. Consult the histories of the Hebrews by Stade, Ewald, Wellhausen, Piepenbring, Guthe, and others; also, G. A. Smith, *Historical Geography of the Holy Land* (New York, 1900).

CANAANITES, *kā'nān-its*. The name given in the Old Testament to the people on the west of the Jordan who were dispossessed by the invasion of the Hebrews. The use of the term is somewhat vague, and in this respect is like the indefiniteness of Canaan as a geographical designation. The Canaanites are commonly enumerated with a group of six other peoples, settled in Palestine prior to the Hebrews—viz., Jebusites, Ammonites, Girgashites, Hivites, Perizzites, and Hittites—to which, in Gen. x. 15, four more are added—Kenites, Kenizites, Kadmonites, and Rephaim—Hivites being omitted; while elsewhere the Girgashites and Hivites are omitted. The grouping is not scientific. The Ammonites represent, apparently, an older settlement than the Canaanites; the Hittites have no connection with Canaanites; while Jebusites and Girgashites are local or territorial designations, forming subdivisions of the Canaanites rather than independent groups; and this may be true, likewise, of the Perizzites. A late tradition (II. Es. i. 21) is probably nearer to the ethnic facts in separating the pre-Israelitish inhabitants of Palestine proper into Canaanites and Perizzites. As to the relationship between the Perizzites and Canaanites we know nothing, though they were probably closely akin. The Canaanites, whose name becomes the general designation for the agricultural population whom the Hebrews found in Palestine, are well known through the accounts which the Hebrew writers furnish. They lived in a state of comparatively advanced culture. As an agricultural people they were rather a peaceful nation, who, however, showed great powers of resistance in opposing the advance of the Hebrews, being better equipped and able to protect themselves in their walled towns. Their religion was precisely of the kind that we would expect among an agricultural people. There was no centralized cult. Each locality had its deity, known as a 'Baal' (i.e. lord), to whom the ground was supposed to belong (see BAAL), and upon whose favor the fertility of the soil depended. Altars were erected to the baals, usually on prominent places or in groves. The pole, representing a tree and symbolizing fertility, stood by the altar, on which the first fruits were piled and conciliatory presents offered in days of distress, or when a failure of the crops was threatened. The festivals were, likewise, of an agricultural character, the three chief festival

seasons being in the spring, early summer, and autumn. They were occasions of merry-making, and the scenes, particularly of the harvest festival, were of a hilarious character, culminating no doubt at times in riot, and perhaps were somewhat licentious. Many of the religious customs of the Canaanites were taken up by the Hebrews upon their taking possession of the country. The invasion marked the change from a seminomadic to an agricultural life for the latter, and they naturally looked to the baalim for protection and blessings of the soil. This amalgamation of Canaanitish worship with the Jehovistic rites evoked the opposition of the ardent Jehovah worshippers, represented by Elijah and Elisha, in the Ninth Century B.C., and by the Hebrew prophets (Amos, Hosea, Micah, etc.) in the Eighth Century, which led finally to the abolition of the old Canaanitish sanctuaries and the recognition of the temple at Jerusalem as the only legitimate seat of Jehovah worship. The language of the Canaanites, identical practically with the Phœnician (q.v.), was adopted by the Hebrews upon their taking possession of the country. Canaanitish and Hebrew, therefore, as ordinarily understood, are synonymous terms. Among recent anthropologists, Sayce (1888) and Brinton (1890) consider the Canaanites a pre-Semitic white race (Canaanites, Phœnicians, Amorites, etc.) of North African (Libyan) stock, and Sergi (1901) is of similar opinion. Others, looking upon 'Amorites' and 'Canaanites' as somewhat synonymous (as Brinton, in 1895, was inclined to do), ally them with the Semites. Keane (1896) uses Canaanites to designate a group of kindred Semitic peoples, which includes "Hebrews, Phœnicians, Carthaginians, and others." The real Canaanites were probably a people of mixed Semitic and Aryan (possibly, also, Hamitic) blood.

CANA-BOTA, kâ'nâ-bō'tâ. A very large shark (*Hexanchus griseus*), inhabiting deep waters off the coast of Europe, and in the Mediterranean, and wandering to the West Indies. See COW-SHARK, and Plate of LAMPREYS AND DOGFISH.

CANACE, kân'â-sé (Lat., Gk. *Κανάκη*, *Kanake*). The offspring of Æolus and Enarete, in Greek mythology, who conceived an incestuous passion for her brother, Macareus, and was punished for it by death. Gower mentions her in the *Confessio Amantis*, and Chaucer in the *Man of Law's Tale*. She is not, however, to be confused with the Canace in the latter author's *Squire's Tale*, who is the daughter of King Cambuscan, and who, owing to the possession of a magic ring, can understand the love plaint of a female hawk.

CAN'ADA (probably from Iroquois *kanada*, cabin), DOMINION OF. A country occupying the whole of the Continent of North America north of the United States, except Alaska (Map: North America, No. 4 Special Maps). The continental portion is about 2700 miles in greatest length, from the Atlantic to the Pacific, and measures about 1600 miles from north to south, which gives to it, with the outlying 'lands' and islands, an area exceeding the United States with Alaska, and nearly equal to that of all Europe; somewhat more than one-sixth of this is under water. Excluding unsurveyed Arctic islands, its gross area approximates 3,500,000 square miles,

the land surface of which is distributed among the component political divisions (largely by computation) as follows:

	Square Miles
Prince Edward Island.....	2,000
Nova Scotia.....	20,560
New Brunswick.....	28,100
Quebec.....	344,450
Ontario.....	219,650
Manitoba.....	64,000
Assinibola.....	86,340
British Columbia.....	382,000
Saskatchewan.....	100,000
Alberta.....	99,255
Athabasca.....	239,500
Keewatin.....	490,000
Yukon.....	196,500
Mackenzie.....	41,200
Ungava.....	276,000
Total.....	3,048,711

No official statement of area is as yet given for the unorganized territory of Franklin, which comprises the Arctic archipelago. The most northerly point of the domain is probably Cape Columbia, in Grant Land. The most westerly boundary is formed by the 141st meridian of west longitude.

TOPOGRAPHY. The physiography of Canada falls broadly into three great divisions, distinguished by fundamental differences in geological structure, surface, and climate, namely: I. The hilly, diversified eastern half. II. The elevated interior plains, comparatively level, and largely treeless, sloping gently northeast and north. III. The mountain region, between the plains and the Pacific Coast, or the Alaskan region, which consists of the northern extension of the Rocky Mountains of the United States, their included plateaus, and of various coast ranges. Each of these prime features of the continental topography is divisible into certain large, natural subdivisions, which conform in the main to the drainage basins, determined by the events of geological history.

I. The eastern part of Canada has a broken or hilly surface of generally low elevation. The highest points of the coast of Labrador approach 8000 feet, but the interior of northern Quebec and of Labrador, or of the region west of Hudson Bay, does not exceed 1500 to 3000 feet, and slopes steadily to the level of the shores of Hudson Bay. This whole vast region, embracing the land from the lower Saint Lawrence to Hudson Bay, and continuing in a broad margin around it, is a succession of low, often bare or thinly forested ridges of hard rocks, between which are innumerable lakes, swamps ('muskegs'), and torrential rivers. Its recent release from universal glaciation, and the unfavorable climate, have not permitted much valuable soil to accumulate, except in small, isolated areas, and the region is not adapted to any considerable human habitation. Many large rivers flow into Hudson Bay from the east; some shorter, but copious ones, from the south, of which the Moos and Abitibi form canoe routes to James Bay; while the Albany River forms a canoe route from the Lake of the Woods region to the same inlet. In the west the drainage into Hudson Bay includes the whole basin of the Red, Saskatchewan, Churchill, and other rivers, thus embracing the southern half of the interior plains area; but this will be spoken of later. The Hudson Bay basin is defined south and southeast by a scarcely perceptible watershed, called 'the height of land,' or, along the northern boundary of the Province of Quebec, where

it is better defined the 'Laurentian Hills,' which divides the heads of the streams flowing northward from those draining southward into the Saint Lawrence. This very ancient river valley, which includes the whole system of the Great Lakes (partly within the United States), is over 2000 miles long, and forms the drainage outlet for an area of about 500,000 square miles. The surface of the Saint Lawrence Valley is broken in places by intrusive igneous rocks, which remain standing above the surface in such abrupt heights as Mount Royal, at Montreal, and the picturesque *buttes* south of that city. Another topographic feature in this region is the Niagara Escarpment, the eastern edge of a plateau over the brink of which the waters of Lake Erie are poured into Niagara Falls (q.v.). As the escarpment is traced northward, it becomes more lofty, rising into high, rocky hills, which form the backbone of the triangular, very picturesque extension of land separating Lake Huron from Georgian Bay. The valley of the Saint Lawrence narrows toward its mouth, where the northeastern extension of the Appalachians forms the mountainous Gaspé Peninsula and also the islands of Anticosti and Newfoundland. South of this lies the distinct region of the Maritime Provinces, whose features are largely similar to those of New England. See NEW BRUNSWICK; NOVA SCOTIA; PRINCE EDWARD ISLAND.

II. The second great division of Canada—the Interior Plains—comprises the area, some 700 miles in breadth, which continues the plains of the United States northward to the shores of the Arctic Sea, between Hudson Bay and the Rocky Mountains. This region is, however, more broken, well watered, and has more forest than the high, open plateaus southward, and is lower, constantly diminishing in altitude northward, the international boundary (latitude 49° N.) nearly coinciding with the watershed between the drainage into the Gulf of Mexico and that into Hudson Bay. Referring to this Canadian plains region, Sir George M. Dawson, chief of the Geological Survey of Canada, wrote:

"The whole interior region of the continent slopes gradually eastward from the elevated plains lying near the base of the Rocky Mountains to the foot of the Laurentian Highlands, and, though the inclination is more abrupt in approaching the mountains, it is not so much so as to attract special attention. Between the fifty-fourth and forty-ninth degrees of latitude, however, along the lines which are in a general way parallel and hold a northwest and southeast course across the plains, very remarkable step-like rises occur. These escarpments form the eastern boundaries of the two higher prairie plateaus, and the most eastern of them overlooks the lowest prairie level, or that of the Red River Valley. The three prairie steppes thus outlined differ much in age and character, and have been impressed on the soft formations of the plains by the action of subaerial denudation of former great lakes and probably also of the sea. . . . The actual increase of elevation accounted for in the two escarpments, however, is slight compared with that due to the uniform eastward slope of the plains. The direction of greatest inclination is toward the northeast, and a line drawn from the intersection of the forty-ninth parallel and the mountains to a point on the first prairie

level north of Lake Winnipeg will be found to cross the escarpments nearly at right angles, and to have an average slope of 5.38 feet to the mile. From the same initial point, in a due east line to the lowest part of the valley of the Red River, a distance of 750 miles, the plains have an average slope of 4.48 feet per mile. . . . Northwest of the North Saskatchewan no extensive treeless plains occur in the central region of the continent, and the forest country of the east forms a wide, unbroken connection with that of the northern portion of British Columbia."

Along the edge of the lowest or easternmost of these levels lies that series of great lakes—Manitoba, Winnipeg, Winnipegosis, Reindeer, La Hache, and many other lesser ones—which form so striking a feature on the map, and empty by large, rapid rivers into Hudson Bay. Down from lakes on the second level flow such large rivers as the English or Churchill, Ice and Dobaunt, the Ice carrying to Hudson Bay some overflow from Lake Athabasca; while from the foot of the Rocky Mountains, and gathering the drainage of all three plains levels, comes the great Saskatchewan, in two branches, the North and the South, to enter Lake Winnipeg (which also receives from the south the large Red-Assiniboine affluent), and thence to flow through Nelson River to Hudson Bay. North of the North Saskatchewan, on about the 55th parallel of north latitude, a line of rocky and forested highlands forms a watershed between its valley and that of the outflow toward the north. This begins with the great Athabasca and Peace rivers, which pass eastward from the base of the Rockies through a rough region to Athabasca Lake, and thence enlarged (as the Slave River) to Great Slave Lake, which also receives the powerful Liard from the west. This lake narrows westwardly into the Mackenzie, which flows northward to the Arctic Ocean, about 120 miles east of the border of Alaska. This great river is the equal of the Missouri in length, but discharges more water than does that stream, and is comparable to the mighty watercourses of Siberia. Its course lies near the base of the Rocky Mountains, west of which lie the head streams of the Yukon (q.v.), all of which are within Canadian territory. East of the Mackenzie, half way between Great Slave Lake and the Arctic Coast, lies the extensive Great Bear Lake, a feeder for the Mackenzie. Here the country is low, and a part of this lake's waters escapes into Coronation Bay by way of the Coppermine River. East of the head of the Coppermine a low divide turns the waters east of it into the Great Fish or Back River, which flows through the desolate wastes, called the Barren Grounds, that lie between Hudson Bay and the Arctic Ocean (Victoria Strait), and empties into the latter at Elliot Bay. Of all these rivers, the greatest is the Mackenzie, but the most important are the Saskatchewan and the Red, for they have made available a wide area of habitable and valuable land. The Saskatchewan collects most of the waters of the three districts, Alberta, Assiniboine, and Saskatchewan, by the two main channels, each some 300 miles in length, and then flows 200 miles more to Lake Winnipeg. This lake also receives, besides the Red River and its tributary, the Assiniboine (which drain all southern Manitoba and much of North Dakota and

Minnesota), the Winnipeg River, and the lakes Manitoba, Dauphin, and Winnipegosis, which, together, equal or exceed the bulk of Lake Erie. Lake Winnipeg itself is nearly as spacious as Lake Huron, and pours its waters through the great Nelson River, a series of rapids descending to Hudson Bay. The Saskatchewan and Red rivers were the former avenues of travel, and their valleys are now the seat of the principal population and industry in the Northwest.

III. The mountainous western border of Canada consists of a belt of snowy ranges from 500 to 600 miles in width. On the east are the Rocky Mountains, continuous with those of Montana, which consist of gigantic uplifts and foldings of the strata. Hence the scenery presents series of vast bedded cliffs, and weather-worn, jagged summits, instead of the rounded domes and slopes familiar in the southern Rockies. The ranges run northwest in approximately parallel lines, which are capped with snow and glaciers. This is due to their high latitude rather than to altitude, since there are but few peaks that exceed 11,000 feet, except between latitudes 52° and 53°, where a number of peaks have recently been described whose elevations appear to exceed 13,000 and 14,000 feet. Mounts Columbia, Forbes, Bryce, Alberta, and Freshfield are seemingly the highest of these. A somewhat distinctive range west of the first is the Selkirk, in which are the headwaters of the Columbia River, and which carries the Great or Illecilleweat glacier. Then comes the Gold or Columbia Range, while farther west lies a broad, elevated plateau valley, drained by the Thompson and Fraser rivers, and forming the centre of British Columbia. Between this valley and the Pacific Coast extends a belt of intricate coast ranges, which northward form the boundary mountains between Canada and Alaska, and whose outermost summits constitute the line of islands—Vancouver, Queen Charlotte, and the Alexander Archipelago—which characterize that coast. (See BRITISH COLUMBIA and ALASKA.) It is through these coast ranges that the Fraser River (about equal to the Ohio) cuts its way in a series of magnificent cañons. These orographic features have had a very important bearing on both the climate and the economic value of this part of the country.

CLIMATE AND SOIL. The difficulty which meets one at the outset who attempts a brief generalization of Canada in any of its broader aspects is well stated by one of the latest essayists in this direction. "To characterize in a few lines," he remarks, "a country covering more than half the continent of North America, and reaching from the latitude of Constantinople to the North Pole; a country whose circuitous coast line on the Atlantic measures 10,000 miles, and whose western shore upon the Pacific, studded with islands and indented by secure harbors and deep inlets, attains almost an equal length; a country where maize and peaches are staple crops, and where vegetation fades out upon the desolate and melancholy shores of the Arctic Ocean—to characterize such a country by a few general phrases is evidently impossible. If we look at the eastern portion alone, we see the greatest forest region in the world. If we consider the central portion, we are regarding the great prairie country; but if we cross the passes into the Pacific Province, we enter upon that 'sea of mountains' compared with which the most moun-

tainous country in Europe is of limited extent." In the northeastern region, the 'Hudson Bay Country,' the characteristics are Arctic or sub-Arctic—a brief, warm summer and a long, cold winter, with much fog at all seasons on the ice-bound coast. The current of cold water flowing down that coast past Greenland keeps the entrance to Hudson Bay frozen nearly two-thirds of the year, and often packs ice along the coast of Labrador so persistently as to make it inaccessible until midsummer; while the region of the Gulf of Newfoundland abounds in fog, and the air of New Brunswick and Nova Scotia is surprisingly cool, with much rain and snow. In the northern interior dry and severe cold prevails over half of the year, the mercury, even as far south as Manitoba, frequently dropping to 50 degrees below zero of the Fahrenheit scale. The climate of the Saint Lawrence Valley, however, is excellent—cold, dry, and bracing, with much snow and occasional severe cold in winter, and in summer heat without much moisture, but usually an abundance of rain for crops, which are also nourished by the moisture given to the ground by the plentiful snow. In the Maritime Provinces the neighborhood of the ocean modifies the extremes both of winter cold and summer heat, but causes more rain and fog. As for soil, north of the Laurentian Hills, and through the Hudson Bay and Labrador regions, it is scanty, and little except garden vegetables can be grown, because of the liability to summer frosts. In the valley of the Saint Lawrence, however, a belt of alluvial lowland near the river is extremely fertile; and the whole of southern Ontario, by reason of its moderate climate and varied soils, largely the result of glacial deposits, is exceedingly well adapted to agriculture in all its phases, and to the raising of all the hardier fruits. The grain crops and apples of Ontario are famous. There is little space among the rocky hills of northern Ontario for agriculture, and the winters are rather too severe north and west of Lake Superior; but when the plains of Manitoba are reached, highly favorable conditions for agriculture are again encountered. The soil of the Red River Valley, including the valleys of the Assiniboine and Souris (Mouse), is a deep black prairie loam of the highest fertility. The same may be said of the whole plains region, even on the high western steppes, where only water is needed to insure great productivity, and of all the valleys of British Columbia and its coast.

The climate of the more southerly, habitable part of the Canadian Northwest is much more favorable to life than one would suppose from a knowledge of its latitude merely. The isotherm of 65° F. mean summer heat, which is that of the St. Lawrence Valley at Quebec, curves northward along the south shore of Lake Superior and through Manitoba and Assiniboia to northern Alberta. This increase of warmth westward and northward, as the mountains are approached, is due to the effect of the mountains upon the prevailing air-currents. There, as elsewhere, the usual winds blow from the west, and come to the coast expanded and saturated with warmth and moisture, after flowing for thousands of miles across the Pacific, whose waters are twenty degrees warmer than are those of the North Atlantic. Vancouver Island and the coast of British Columbia have a climate, in consequence, much like that of the south of England,

but warmer, and even more moist. Flowers bloom in the gardens the year round, and fruit reaches the utmost excellence. Warmth and rainfall are derived from the latent heat, and absorb moisture set free by condensation of the oceanic air against the high and cold Coast Range. Robbed of only a portion of their burden, but lifted and rarefied by elevation, the winds sweep across the interior valley of British Columbia and strike against the snowy Rockies, to deposit more rain or snow, but rain so rarely falls on the intervening Fraser-Thompson Valley that agriculture there must depend upon irrigation. The reason for this is that the ever-ascending heat of the sun-baked plains buoys up the higher air-currents and lifts them straight across to the Selkirks and Eastern Rockies, to whose vast snow-fields they give almost all of the moisture yet remaining. These once warm winds are now, however, cool winds, because they have become dry and rarefied. The eastern side of the Canadian Rocky Mountains has little snow, and is sparsely provided with trees, as compared with its western side, or with the coast ranges, and the general temperature is cooler; yet the eastern foothills of the Rockies have a milder climate and earlier spring than the western, or than is enjoyed by Manitoba. This is due to the phenomenon called the Chinook, which is a wind caused by the rarefied air rushing down from the summits, necessarily increasing in density by compression as it strikes the plains level, absorbing moisture and giving up its latent heat to the extent of about 23° F. The chinook is not a wind that has come warm from the Pacific, but is of local origin. In summer the same breeze seems cool in comparison with the fierce radiation of the baked plains, but it is equally a chinook. (See CHINOOK WIND.) The genial influence of this warm, dry wind is seen in winter in the quick evaporation of the snow, and the consequent exposure of pasturage to stock, and in producing early conditions of spring. On Peace River the winters are milder than those of Manitoba or Ontario, and everything that will grow near Toronto will ripen at Dunreagan, 13 degrees of latitude north of it—the same latitude as the middle of Labrador! Its influence wanes with distance eastward, however, and Manitoba is subject to the extremes of its position at a high latitude in the centre of a continent, being subject to excessive noonday heats in summer and excessive cold in winter, with the nights always cool, and the autumnal frosts liable to begin in August. In the extreme north a rigorous Arctic climate prevails, with the winter temperature descending to -75°. The summers are, however, still favorable to plant growth. The whole Northwest, however, is healthful in a high degree.

FLORA. The flora of all the northern part of Canada is Arctic and sub-Arctic, and this characterizes the scanty growth in the eastern part all the way down to the height of land which separates Labrador and the basin of Hudson Bay from the Saint Lawrence Valley. A great space between Hudson Bay and the Arctic shores is almost a desert, and has been known from the earliest times as the Barren Ground or Tundra, yielding hardly anything more than mosses, lichens, and a few willows and hardy herbs. The flora of the Saint Lawrence Valley and of the Maritime Provinces differs little from

that of the northeastern United States, the whole of that space having been originally covered with mixed forests of large and valuable trees, both coniferous and hard wood. The western plains are comparatively treeless as far north as the Saskatchewan, yet are covered with prairie grasses and herbage, which thin out toward the higher and drier steppes westward, where the plains are covered with the bunch-grasses which once supported enormous herds of buffaloes and antelopes, and now furnish sustenance for a rich stock-raising region. North of the Saskatchewan a broad belt of rather small and sparse trees extends from Hudson Bay to Great Slave Lake and the Rocky Mountains—chiefly spruce, tamarack, and poplar. The dry western slopes and valleys of the Rocky Mountains are thinly covered with woods, mainly pine; but the forest increases in density and the trees in size as one proceeds west toward the region of greater rainfall; and after passing the treeless Fraser-Thompson Valley, the coast ranges, and especially their western slopes, are found covered with the dense forests of mighty evergreen trees that characterize the northwest coast of all North America. The principal trees are the Douglas spruce, or 'Oregon pine' (*Pseudotsuga*); the white cedar (*Thuja*); a hemlock (*Tsuga Mertensia*), and Engelman's spruce (*Picea Englemanni*). These coast forests are inconceivably dense and sombre, and their average height on the lowlands is not less than 200 feet, while the Douglas spruces often exceed 300 feet, and the cedars are hardly less tall.

FAUNA. The animals of Canada are as varied as its flora and characteristic of northern latitudes. All bear a close resemblance to those of Northern Europe and Asia, and many species are identical—that is, have a circumpolar range. (See AMERICA, paragraph on *Fauna*.) The carnivora are represented by several species of the weasel family (such as the ermine, sable, fisher, wolverine, mink (qq.v.), etc., whose abundance and value long ago gave the name Fur Countries to northern Canada. There are also the lynx, bear, fox, wolf, skunk, and in the Northwest the badger. The puma or American lion is still found in some parts. Among the rodents, the beaver is so widespread and characteristic, and was so important to the beginnings of colonial civilization, that it has become the national emblem of the Dominion. The Canadian porcupine, muskrat (locally called 'musquash'), hares, and many smaller rodents are numerous, and on the western plains are a variety of burrowing 'gophers' and the like. The Virginian and black-tailed deer enter the southern edge of Canada, and the elk is found in the Rocky Mountains, but the moose and various caribou range all over British North America; and in the mountains of British Columbia the wild sheep and the white goat antelope are numerous and highly characteristic. The prong-horn antelope is still abundant in some parts of the Saskatchewan Valley, and the musk-ox is found in the Arctic tracts. There is an immense variety of birds, many of which, characteristic of northern climates, are unknown southward; but the majority are migrants that go to the northern parts of Canada to breed, and leave the country in the winter for warmer regions southward. Fishes are numerous in all the inland waters, and about all the coasts (see Fisheries, below), but reptiles and the

months, and it is generally adequate for the needs of the crops. The driest portion of the plain is on the western border, but much of this is irrigable and even in its natural state is well adapted to grazing. The Government exercises a close supervision over irrigation, and there are 525 miles of ditches and canals. From the Great Lakes eastward to the Atlantic the agricultural area is limited only by surface conditions, the climate being very favorable. There is in this area much hilly and broken territory which does not lend itself readily to profitable cultivation. But throughout northern Canada, including the greater portion of the Laurentian region, the climatic conditions will never admit of agricultural development. See *Climate*.

The districts in which agriculture has developed most are Prince Edward Island, the protected valleys of the Annapolis in Nova Scotia and the Saint John in New Brunswick, the narrow valley of the Saint Lawrence above Quebec City, peninsular Ontario, and the Red River Valley in Manitoba.

Ontario far exceeds any other province in agricultural importance—indeed, it is equal to all the others combined. Especially remarkable is the extensive cultivation of oats, the acreage being about 2,400,000. In barley and peas, particularly the latter, it also greatly outranks the other provinces, each crop having considerably over 500,000 acres devoted to its cultivation. Its acreage (1,400,000) and yield of wheat is almost as great as that of the more famous fields of Manitoba, and it is practically the only province of the Dominion in which corn is raised. Much attention is given to the raising of hay in Ontario and all the eastern provinces, large quantities of which formerly used to be shipped into the United States, particularly from the eastern townships of Quebec.

The Maritime Provinces, excepting Prince Edward Island, have never entered so extensively into agricultural pursuits, but have become well known for the production of certain crops. Potatoes and turnips receive great attention, and the yield and quality of the product are remarkable. The same is true of the apple crop of the Annapolis Valley in Nova Scotia, and, to a less degree, of the Saint John's Valley, New Brunswick. The annual shipments of apples from these provinces together with those from Ontario and Quebec are enormous. The Lake Erie coast of Ontario has become noted for its grapes. It has been found that larger fruits do not thrive well on the western plains, but throughout the whole of southern Canada and well to the northward, various kinds of smaller fruits, particularly berries, thrive abundantly. British Columbia, though not possessed of such large tracts of arable land as the other provinces, can still boast of its greater adaptability for fruit-raising, and the production of hops is being extensively engaged in.

On many farms throughout agricultural Canada, particularly in Manitoba, wheat formerly constituted almost the only crop, but more recently there has been a growing tendency toward mixed farming and the raising of cattle and other stock. Canadian stock has a wide reputation for the purity of its breeds, and great care is taken to prevent deterioration. The raising of beef for the English market has long been an important source of revenue. Probably no phase

of agricultural development in the East is so remarkable, however, as the dairy industry. In Ontario alone the creameries increased from 74 in 1893, to 323 in 1899, and during the same period the cheese factories increased from 897 to 1203. In all the eastern provinces poultry-raising is attended to, and the exportation of eggs is very large. In the absence of other recent statistics covering the whole of Canada, the export figures are the fairest available test of agricultural development. The total exports of the domestic agricultural products increased from \$19,341,000 in 1868, to \$81,000,000 in 1900. Wheat and flour had not increased very materially until the last three years of that period, when it averaged over \$18,000,000, considerably more than twice the average for former years. Oats has averaged a little less than \$3,000,000 for the last three years mentioned, which is also over twice the average for former years. Barley, on the contrary, shows a decided falling off, while peas continue to fluctuate about \$2,000,000. Butter, while showing great fluctuations, reached its high-water mark in 1900, when it exceeded a value of \$5,000,000. Cheese, however, shows a constant increase, having been \$548,000 in value in 1868, \$9,000,000 in 1890, and \$19,000,000 in 1900. Cattle shipments increased rapidly until 1891 and more slowly since that period, the value amounting to \$9,000,000 in 1900. The exports of sheep for two decades have fluctuated at about \$1,500,000 in value. The exportation of horses, whose value averaged about \$2,000,000 for the decade ending with 1890, averaged about \$500,000 less for the succeeding decade, but subsequently increased, due to the demand for the war in South Africa.

The Dominion Government has established a central experimental farm at Ottawa, and four branch farms in more remote parts of the Dominion. The several provinces have encouraged agriculture by grants to societies and fairs, bonuses to creameries and cheese factories, and in various other ways.

MANUFACTURES. The great abundance of natural resources in Canada, including raw manufacturing material, affords a good basis for the upbuilding of the manufacturing industry. Additional advantages come from the abundance of fuel, particularly in Nova Scotia, where coal is plentiful, and from the widespread facilities for procuring water and electrical power afforded by the numerous rapids and falls characteristic of Canadian rivers. The thriving condition of Canadian industry is indicated by its trade statistics, which show that the value of the exports of manufactured articles, exclusive of lumber products, increased from \$5,741,000 in 1890, to \$14,224,000 in 1900. Of the resources upon which Canadian manufactures depend, the most important are her forests. (See **LUMBER INDUSTRY**.) In former days these furnished the material for extensive shipbuilding, but with the decreased use of wooden vessels this has become unimportant. There has, however, been a continuous growth in the manufacture of furniture, doors, sashes, and other wooden articles. As indicated by the export figures, the value of manufactures of wood was augmented from \$870,000 in 1890 to \$3,127,000 in 1900. The greatest increase was contributed by wood-pulp, the value of whose exports increased from \$168,000 in 1890 to \$1,816,000 in 1900. This is the product of the

spruce forests, for which paper-making insures a lasting and growing demand. The abundance of hemlock is also of great importance, in view of the growing demand for it in the tanning trade. Leather is another article of growing importance. Boot and shoe manufacturing is carried on at Montreal and Quebec, a large part of the labor being done by French Canadian girls. Cottons are manufactured in Quebec and woollens in Ontario. The manufacture of iron and steel products is another rapidly developing branch of industry, most promising in Nova Scotia, because iron ore, coal, and limestone are there found in close proximity. The value of the exports increased from \$294,000 in 1890 to \$1,535,000 in 1900. At Winnipeg, Toronto, and a few other points, pork-packing is carried on.

LUMBER INDUSTRY. From an early day the forests of Canada have been one of her main sources of wealth and the making of lumber has been a leading factor in the industrial life of the people. In the eastern provinces the trees have been cut from large sections of the country, including almost the whole of Ontario south of the Canadian Pacific Railroad. Formerly little attention was given to judicious cutting, and the approach of the lumberman meant the destruction of the forest. Present laws furnish partial protection. Worse than the onslaughts of the lumbermen has been the destruction by fires, but an effort is now being made to guard against that also; nevertheless, some of the most valuable varieties of forest trees—notably the white pine—stand in danger of extermination. Owing to the very limited market in the West, the fine forests of Douglas fir and other useful trees are but little worked. The great forests of the country are Government property, and a large revenue is obtained therefrom. (See *Finance*.) The lumberman must first buy at auction a license to cut, after which he pays an annual rent on the ground and a royalty on the timber cut. Winter is the cutting season, when the snow affords means of transporting the logs to the streams, and the amount of the winter's yield is therefore dependent upon the duration of the snow. In former years the export of timber to English markets was generally in the log, but more recently mills have been established, and the logs are sawed before shipment. The exports of forest products increased from \$26,000,000 in 1890 to \$29,663,000 in 1900, the United States and Great Britain taking about equal quantities. Most of the product from the Great Lake region goes to the United States, while that from the Saint Lawrence and Maritime Provinces goes to Europe. White pine and spruce are the most important varieties.

TRANSPORTATION AND COMMUNICATION. Canada owes its commercial development in a great measure to its facilities for navigation, particularly on the Saint Lawrence River and Great Lakes. These great natural waterways have been further improved by the Government by means of a thorough-going canal system, so that vessels drawing 14 feet of water can now pass from Lake Superior to the Atlantic. It has been the ambition of the Canadians to make it possible for ocean steamers to pass directly to and from the lakes, but it has seemed impracticable so far to carry it out, and Montreal will probably continue to be the head of ocean navigation. The Saint Law-

rence canals, which are nine in number, have a total length of 73½ miles, while those connected with the Ottawa and Rideau rivers have a total of 29¼ miles in length. A magnificent ship canal also connects Lake Superior with Lake Huron along the east bank of the Saint Mary's River. The total cost of constructing and maintaining all Canadian canals has been \$95,316,000 (1900). Of other waterways, the Saskatchewan of the Western plains is destined to be of great importance as a means of transportation. It was in early days a canoe route to the Rocky Mountains, and now has steamboats running for long stretches on the North Saskatchewan. Steamboats also run for a long distance on the Red River. The Hudson Bay Company keeps a line of steamers operating upon the Mackenzie River for the benefit of its posts, and during the brief summer they pass back and forth between the mouth of the Athabasca and the mouth of the Mackenzie. There are also steamboats on the upper Fraser and Thompson rivers. Finally, the recent peopling of the Yukon district has caused a frequent steam service to be operated on that river and its larger headwaters, enabling passengers to go to any of the towns along the river by steamboat from the terminus of the White Pass Railroad, at White Horse Rapids, to its mouth. See ALASKA; YUKON GOLD-FIELDS.

The same zeal which has characterized Canada in the utilization of her waterways has led her to still greater efforts for the creation of an adequate railway system. It was realized that intercolonial and transcontinental railways were a necessity, not only for the opening up of the West and the commercial development of the whole country, but more particularly as a political measure, inasmuch as the railways would serve as a bond of union between the provinces, and indeed the assurance of such a road was a prerequisite of some of the provinces before they would enter into the present confederation. Thus it was that, among others, two of the principal lines—the Intercolonial and Canadian Pacific—were undertaken through Government initiative, and the former was completed and is still held by the Government. The latter, however, as is true of most other lines, was turned over to private hands, the Government conferring upon the company a grant of land and a cash subsidy, and the line thus provided for was successfully completed in 1887. With the development of the country the railroads are able to rely more and more on their own resources, although they still seem to be far from a position of entire financial independence of the Government. Aid to the railroads has been given by the provincial and municipal governments, as well as by the Dominion. Of the billion dollars of capital invested in the roads, 16 per cent. represents Dominion grants, 3.18 per cent. provincial grants, and 1.59 municipal grants. In 1900 it was estimated that 1217 passengers and 2036 tons of freight were carried to every mile of line open; the length of track amounted to 17,824 miles, 6800 of this being in Ontario. The Grand Trunk line and the other two lines above mentioned control about two-thirds of the total. Canadian lines connect with those of the United States by bridges across the Saint Lawrence, Niagara, and Saint Mary's rivers, by tunnels under Detroit

River, and at several points on the Southwestern frontier.

COMMERCE. The foreign trade of Canada shows a remarkable growth. The exports of domestic produce increased from \$85,200,000 in 1890 to \$170,000,000 in 1900. The largest item (\$56,000,000) and the greatest absolute advance was in animals and animal products. Second in absolute and first in relative increase were the mine products. The export of agricultural and manufactured products each more than doubled during the period, but the increase of forest and fish exports was not so great. (See sections in this article on these different industries.) Great Britain and the United States receive most of the exports, the proportion going to Great Britain having increased during the period from 46 to 65 per cent. due to the great increase of agricultural and animal exports, most of which goes to that country. The mine products constitute the only export which goes almost exclusively to the United States. The exports of foreign products in 1900 amounted to \$21,200,000. The imports for home consumption have similarly increased, being \$180,800,000 in 1900, against \$112,800,000 in 1890. Great Britain and most of her possessions enjoy preferential tariff rates admitting goods on a tariff rate $33\frac{1}{3}$ per cent. less than the duty levied on goods from foreign countries.

The Canadian trade of the United States is next in importance only to that with Great Britain, Germany, and France. The exports from the United States to British North America are nearly three times as large as the imports. The following table shows the course of trade during the last decade of the century:

YEAR	Imports into British North America from the United States	Exports from British North America into the United States
1891.....	\$39,000,000	\$39,000,000
1892.....	45,000,000	35,000,000
1893.....	49,000,000	34,000,000
1894.....	58,000,000	31,000,000
1895.....	54,000,000	37,000,000
1896.....	61,000,000	41,000,000
1897.....	66,000,000	41,000,000
1898.....	85,000,000	32,000,000
1899.....	90,000,000	32,000,000
1900.....	97,000,000	40,000,000

It will be observed that while the exports from Canada to the United States remained stationary during the decade those from the United States to Canada increased nearly 150 per cent.

BANKS. Every bank, in making payments, can be compelled to pay out a certain proportion of Government notes, and must hold of its cash reserve at least 40 per cent. in Government notes. In 1900 the various banks and their branches had a total capital of \$65,000,000, with \$46,500,000 in circulation, \$305,000,000 on deposit, \$356,40,000 in liabilities, and \$459,700,000 assets. Post-office savings banks have been in operation since 1867: in 1900 the depositors numbered 150,900, and the average deposit amounted to \$248. There are also Government savings banks in Ontario, Nova Scotia, New Brunswick, Manitoba, British Columbia, and Prince Edward Island.

GOVERNMENT. By the terms of the British North America Act of 1867, the provinces of

Ontario and Quebec, known also as Upper and Lower Canada, joined with the Maritime Provinces of Nova Scotia and New Brunswick to form a Federal Government under the name of the Dominion of Canada. Since that time the original number of provinces has been increased to seven by the admission of Manitoba, British Columbia, and Prince Edward Island, and the public territory of the Dominion has been augmented by the purchase of the Northwest Territories from the Hudson Bay Company; but the Constitution drafted in 1864 and embodied in the act of 1867 is still in force. Based upon the general principle of the definite division of powers between provincial and central governments, the Canadian Constitution differs from that of the United States in the fact that all powers not explicitly assigned to the provinces are reserved to the central Government. Under the exclusive jurisdiction of the Federal Legislature are the administration of the public debt and property, the imposition of taxes for general purposes, the organization of the public defense, including the militia; the subjects of banking, paper money, promissory notes, legal tender, currency, and coinage; the regulation of commerce, navigation, and shipping; the coast service, the postal service, census, statistics, patents, and copyright; naturalization, aliens, and Indians; marriage and divorce. The subjects within the scope of the provincial legislatures are, among others, those of taxation for local purposes, the regulation of local commerce, the erection of municipal corporations, the borrowing of money on the credit of the province. On the questions of agriculture and immigration, the Federal and the provincial legislatures possess concurrent jurisdiction; but it is provided that in the contingency of a conflict of legislation, the law of the Dominion shall prevail. Although the powers of government have, in this manner, been definitely portioned out, there has been no lack of intrusion on the part of either party into the sphere of the other. On such occasions, when compromise has been found impossible, the principle of the superior authority inherent in the central Government has been adhered to. Striking examples of this predominance are the right given the Governor-General to disallow within a year any law enacted by the provincial legislatures and the power of appointing the Lieutenant-Governors of the provinces.

The lawmaking power of the Federal Government is vested in the King of Great Britain or his representative and the Dominion Parliament. The Parliament, the seat of which is at Ottawa, is composed of an Upper House or Senate and a Lower House or House of Commons. The members of the Senate, who are appointed for life by the Governor-General, must be subjects of the King, 30 years of age, residing in the province whence they are summoned, and owning property there to the value of \$4000. At present there are 81 Senators, of whom 24 are from Ontario, 24 from Quebec, 10 from New Brunswick, 10 from Nova Scotia, 4 from Prince Edward Island, 4 from Manitoba, 3 from British Columbia, and 2 from the Territories. The House of Commons is elected practically by manhood suffrage for a period of five years, on the basis of population. Officers of the civil service and Government contractors may not sit in Parliament. It is provided that Quebec shall always have 65

representatives in the Commons, and the other provinces a number bearing the same ratio to their population as 65 bears to the population of Quebec. On the basis of the census of 1901 the representation in Parliament comprised 92 members for Ontario, 65 for Quebec, 18 for Nova Scotia, 13 for New Brunswick, 10 for Manitoba, 8 for British Columbia, 4 for Prince Edward Island, and 6 for the Territories.

The executive power is vested in the King or his representative (the Governor-General) and a Privy Council composed of a premier, thirteen heads of departments, and two ministers not of the Cabinet. The governmental departments are those of State, Trade and Commerce, Justice, Marine and Fisheries, Railways and Canals, Militia and Defense, Finance, Posts, Agriculture, Public Works, Interior, Customs and Internal Revenue. The principles regulating the relations of the executive to the legislature, and of the two branches of the legislature to each other, are the same as those that underlie the parliamentary scheme of government in Great Britain. The Governor-General is practically guided by his ministers, who in turn are responsible to the House of Commons; and though the executive may reserve a law for the consideration of the home Government, or disallow it altogether, the latter right is in practice never exerted, and the former is employed only when a measure concerns the interests of the Empire at large and tends to affect the relation of the Imperial Government to foreign powers. Within Parliament the predominant power is wielded by the popular chamber. Not only must money bills originate in the Commons, but the Senate may not even amend a bill from the Lower House; its power of rejection is seldom employed, and though it possesses the right of initiative in many matters, its share in originating legislation is quite inconsiderable.

Of the provincial governments and of the differentiation between their scope of authority and that of the State, it may be said that in general they are endowed with the full power of control over local affairs, subject only to the consideration of the general welfare of the Empire. A detailed description of provincial governments will be found under the names of the several provinces.

The judicial branch of the Federal Government consists of a Supreme Court at Ottawa, with appellate civil and criminal jurisdiction throughout the Dominion, and an Exchequer Court with powers of admiralty. There are no inferior Federal courts, but the central government avails itself of the judicial machinery in each of the provinces, which comprises a superior court, county courts, police magistrates, and justices of the peace. To be precise, however, the superior and county courts are not exclusively State tribunals, in that their judges are appointed by the Governor-General of the Dominion. The penitentiaries, too, are under the care of the Federal Government.

Army.—The King is the commander-in-chief of the naval and military forces, but the control of them is in the hands of the Dominion Parliament. Except a garrison of 2000 British troops at Halifax there is no regular army in Canada; the defense of the Dominion is intrusted to the militia, which comprises all British subjects between the ages of 18 and 60, and is divided into an active force serving for three years and a

reserve force, which includes all non-active citizens liable to service. The active militia is raised by voluntary enlistment or by draft, and is limited by law to 40,000 men. On June 30, 1901, the effective force numbered 38,090 officers and men. The Dominion takes no share in the naval defense of the country, which is left entirely to the Imperial Government.

FINANCES. The central Government controls the collection of the customs revenue, and over half the receipts come from this source. Free trade exists between the provinces. The customs revenue increased from \$23,900,000 in 1890 to \$28,800,000 in 1900; the internal revenue during the same period increased from \$7,600,000 to \$9,800,000, and the revenue from other sources increased from \$8,293,000 to \$13,800,000. The provinces surrendered to the central Government the power of collecting the customs revenue only on condition that they should receive in return annual subsidies. In 1890 the subsidies aggregated \$4,100,000, in 1900 \$4,250,000. Of the other principal items of expenditure, the charges on the public debt increased during the decade from \$9,656,000 to \$13,400,000; railways and canals remained about constant, viz. \$5,311,000 and \$5,400,000, while the public works charges decreased from \$4,892,000 to \$2,400,000. The total expenses for 1900 were \$44,000,000. The per capita receipts were \$9.50; the per capita expenditure \$8. The net debt of the Dominion is \$265,000,000.

POPULATION. In 1703 the French population amounted to about 65,000, confined to the immediate vicinity of the lower Saint Lawrence and its tributaries; in 1791 Upper Canada had 50,000 inhabitants and Lower Canada 130,000. In 1860 the total population, exclusive of Indians in the Northwest and Hudson Bay Territories, was 3,906,810—2,110,502 born in Great Britain and Ireland and 1,082,940 French; in 1871, 3,635,024; in 1881, 4,324,810; in 1891, 4,833,239; in 1901, 5,338,883. The following table shows the distribution by provinces and the changes during the last decade:

PROVINCES	1891	1901
British Columbia.....	98,000	190,000
Manitoba.....	162,000	246,000
New Brunswick.....	321,000	381,000
Nova Scotia.....	460,000	459,000
Ontario.....	2,014,000	2,167,000
Prince Edward Island.....	109,000	108,000
Quebec.....	1,488,000	1,620,000
Territories { Alberta.....	66,000	145,000
Assiniboia.....		
Saskatchewan.....		
Unorganized Territories.....	32,000	75,000

It will thus be seen that the Canadian population increases but slowly, the growth for the last decade being less than 10 per cent., not so great as would result from the natural increase by birth, the birth-rate being high, as indicated by the average size (5.1+) of families. The most marked growth has taken place in the Western region. Much of this is attributed to the increased interest in mining. According to the census of 1901, the foreign-born were distributed as follows: British Islands, 290,016; British possessions, 15,837; foreign countries, 278,804 (United States, 127,891); not given, 14,589. In the eastern provinces large numbers have crossed the international boundary into the States—

particularly into the New England States. There is a decided tendency on the part of many Canadians to pass back and forth across the boundary according to seasonal changes in the labor market. The population of Canada includes a large variety of race elements, and the process of amalgamation has been much less active than in the United States. The great expanse of area and the sparseness of the inhabitants admits of isolation, and is largely responsible for the lack of amalgamation. The French, who were the first settlers, located principally along the Saint Lawrence, in what is now the Province of Quebec, and their descendants still constitute a large majority of the inhabitants of that province. In the determination of the policy of the British Government formerly, and of the Dominion today, the presence of this French element has been and is a main consideration. The French language is still commonly spoken, and is even permitted and often heard in the Dominion Parliament. The French were the hunters and trappers of the early days, and in this capacity scattered throughout the vast domain, mingling freely and amalgamating with the Indians, which accounts for the population of half-breeds so largely represented in Manitoba and the Northwest Territories. The French Canadians are well represented also in the recent Western colonization. In the other Eastern provinces people of British descent are in the great majority—the Scotch in Nova Scotia and the English in the other three. The Irish are well represented in the larger cities. The eastern townships of Quebec were settled by loyalists from the revolted American colonies, who emigrated there during or following the time of the American Revolution. Ontario received a large contingent of the New England opponents to the War of 1812.

In 1900 the Indians in Canada were estimated at 99,000, as follows: British Columbia, 24,523; Manitoba and the Northwest Territory within treaty limits, 24,468; Ontario, 20,703; Northwest Territories outside of treaty limits, 14,566; Quebec, 10,785; Nova Scotia, 2018; New Brunswick, 1639; Prince Edward Island, 308. The number seems to be decreasing, but, owing to the uncertain accuracy of the early enumerations, it is impossible to ascertain the amount of the decrease. The care of the Indians is in the hands of the Indian Department of the Dominion Government, which has a superintendent of Indian affairs in each province. Reservations are provided for the different tribes, but the Indians are not necessarily confined to them. Special provisions, such as annuities and financial assistance, are provided for the Treaty Indians. Others, however, such as those of British Columbia, successfully support themselves. Acts passed by the chiefs and councilors for the regulation of local affairs may be enforced if approved by the Government. Rights of franchise and full citizenship are given the tribes as they become sufficiently advanced in civilization. Much progress is being made in this direction, especially by the tribes of British Columbia, yet hunting and fishing remain their chief occupations, though they work in many sawmills, fisheries, etc. Intertribal conflicts are of rare occurrence, nor has their relation with the General Government been characterized by so great a degree of friction as has prevailed in the United States.

Religion.—There is no State Church, but to the Roman Catholic Church in Quebec are guaranteed the privileges enjoyed previous to British possession. This Church was the first and for a long time practically the only Church in the Canadian territory, and still includes the great mass of the population of Quebec, and over two-fifths of the total church membership of the Dominion. The Catholics are of least relative importance in Ontario and Manitoba. The Methodists, Presbyterians, and Anglicans rank next in order of importance. While all these are well distributed throughout the various provinces except Quebec, the Methodists are far in the lead in Ontario, but are exceeded by the Presbyterians in some of the other provinces, particularly Nova Scotia. Neither of the two latter denominations is divided into numerous factions, as in the United States. Of other denominations, the Baptists and the Lutherans are the strongest. The leading sects have each one or more divinity schools. The following table gives the membership of the leading denominations:

DENOMINATIONS	1891	1901
Anglicans.....	646,000	680,300
Baptists.....	257,400	292,400
Baptists (Freewill).....	45,100	24,200
Congregationalists.....	28,100	28,200
Lutheran.....	63,900	92,300
Methodists.....	847,700	916,000
Presbyterians.....	755,300	842,300
Roman Catholics.....	1,992,000	2,228,500

Cities.—The per cent. of urban population is low. Winnipeg, Vancouver, and Sydney had the highest rate of increase during the last decade. The following gives the population of the principal cities, as returned by the census of 1901: Montreal, 266,000; Toronto, 207,000; Quebec, 68,000; Ottawa, 59,000; Hamilton, 52,000; Winnipeg, 42,000; Halifax, 40,000; Saint John, 40,000; London, 38,000; Vancouver, 26,000.

EDUCATION. There is no centralized system of education for the whole Dominion, each province being left to control its own educational matters. For a fuller statement, therefore, the reader is referred to the articles on the different provinces. In all provinces the schools are free, and in most provinces attendance is compulsory. Local trustees are elected to look after the separate schools, but a careful supervision is exercised by the provincial superintendent and his council. Especially noteworthy is the thorough and comprehensive school system of Ontario. In provinces where Catholics have a strong representation (Quebec, Ontario, and Manitoba), the denominational problem has been the most important one that has confronted the educational system, and in the case of Manitoba it has been of a rather grievous nature. In Quebec there is a complete cleavage between the two sects, extending even to the council of public instruction, which is divided into Catholic and Protestant committees, the former committee being composed of Roman Catholic bishops. In Ontario the educational council is not divided, but either sect, under certain conditions, can establish separate schools. In Manitoba there are no separate schools, but religious instruction may be given to those pupils whose parents may demand it. The expense of the schools is met

by Government grants and local taxation, the latter covering more than two-thirds of the expenditure for all the provinces, but differing greatly from province to province. There are a large number of universities and classical colleges, including Dalhousie, Nova Scotia (founded 1820); Montreal (1821); New Brunswick, Fredericton (1828); University of Toronto, Ontario (1828); Queen's College, Kingston, Ont. (1841); Laval University, Quebec (1852); University of Manitoba (1877); and the Royal Military College, Kingston, Ont. (1874). The principal scientific societies are the Royal Society of Canada; Natural History Society of Montreal; Canadian Institute, Toronto; Nova Scotia Institute; Natural History Institute, New Brunswick; Scientific and Historical Society, Winnipeg; and Society of Natural History, Victoria, with a fine local museum.

HISTORY. It is probable that Bjarni Herjulfson (q.v.), a Norseman, sighted the coast of Canada, opposite Greenland, in 986, and that Leif Ericson sailed along a considerable part of the eastern coast in 1000. John Cabot (q.v.) in 1497 reached the shores of the New World in the neighborhood of the Gulf of Saint Lawrence. It is upon this voyage that England subsequently based her claim, in part, to the whole of North America. For the most part, however, the territory included within the present Dominion, excluding the former Northwest Territories and the Hudson Bay country, was explored and first settled by the French. Basque and Breton fishermen began to visit the cod-banks of Newfoundland as early as 1504; Denis of Honfleur and Aubert of Dieppe explored the Gulf of Saint Lawrence in 1506 and 1508, respectively; the Baron de Léry made an unsuccessful attempt to settle Sable Island in 1518; and in 1524 Verazano, under the direction of Francis I., sailed along the coast of North America from the thirty-fourth to the fiftieth parallel of north latitude. In 1534 Jacques Cartier (q.v.) entered the Saint Lawrence and at Gaspé took formal possession of the country in the name of the King of France; and on a second voyage, in 1535-36, he ascended the river as far as Hochelaga (Montreal), wintered at Stadaconé (Quebec), and, while passing up the stream, entered the present harbor of Sainte-Genevieve, and gave it the name Saint Lawrence, which was afterwards extended to the gulf and the river. Jean François de la Roque, Sieur de Roberval (q.v.), with the assistance of Cartier, made an abortive attempt to establish a colony at Cape Rouge in 1541-43. The Marquis de la Roche received a commission from the King as lieutenant-general of Canada, and in 1598 having bargained to colonize New France, established a short-lived settlement on Sable Island; and in the following year Pontgravé and Chauvin established an equally short-lived settlement at the mouth of the Saguenay. In 1603 Champlain made the first of his voyages to Canada, and his name is inseparably connected with the history of New France from that date until the time of his death, in 1635. (See CHAMPLAIN, SAMUEL DE.) In 1604 he assisted Pierre du Guast, Sieur de Monts, in bringing out a colony which first settled on Dochet Island, in the Saint Croix, and in the following year was moved to the site of the present Annapolis in Acadia or Nova Scotia (q.v.). This

colony, however, was broken up temporarily by the English under Samuel Argall, in 1613, and the first permanent settlement in Canada was made at Quebec in 1608 by Champlain, who within the next few years discovered lakes Champlain (1609), Huron (1615), and Erie (1615), established a temporary settlement at Montreal (1611), and by taking part with the Hurons and Algonquins, the original inhabitants of Canada, against the Five Nations, in 1609 and 1615, committed France to a policy which was to be of the greatest significance in the history of New France, arousing, as it did, the enmity of the powerful Iroquois, who united first with the Dutch and then with the English, and frequently thwarted the French in their schemes of expansion and conquest. In addition to making numerous inroads upon the settlements of the French themselves, they in time virtually annihilated the Hurons, who had allied themselves to France. "They ruined," says Parkman, "the trade which was the life-blood of New France; they stopped the current of her arteries and made all her early years a misery and a terror." The French governors repeatedly attempted to overcome the Confederacy, and at times seemed on the point of meeting with success; but in spite of severe reverses and of the occasional destruction of their towns, the Iroquois continued to stand as a barrier to French encroachments and as a protection to the English colonists, though, largely as a result of the vigorous policy of Frontenac (q.v.), the ables of the French governors after Champlain, their aggressions and inroads virtually ceased in the beginning of the Eighteenth Century. In 1625 several Jesuits arrived at Quebec, and for almost half a century thereafter the order had a preponderating influence over secular as well as religious affairs, insomuch that during the early period of its history New France was in many respects essentially a mission. The affairs of the colony having been grossly mismanaged in the first two decades, Richelieu, in 1627, organized the Company of New France, better known as the 'Company of the Hundred Associates'—a corporation which, under the quasi-supervision of the Crown, virtually ruled the whole of New France until 1663, besides exercising a monopoly over the immensely valuable fur trade. In 1642 Montreal was permanently founded by a company of religious enthusiasts headed by the Sieur de Maisonneuve, and in 1659 Laval (q.v.), the titular bishop, by papal appointment, of Petrea in Arabia, was placed at the head of the Catholic Church in New France, in which capacity he had a powerful influence for many years over civil as well as ecclesiastical affairs.

In 1663 Louis XIV. dissolved the Company of New France and placed Canada under the direct control of the Crown, though for ten years thereafter (1664-74) a new corporation, the 'Company of the West,' exercised a virtual monopoly over the trade of the colony. Under the royal Government, which lasted until 1760, the affairs of New France were administered by a Governor, an Intendant, and a Superior Council, all appointed by the Crown, the Governor being empowered to command the troops, conduct negotiations with foreign colonies and Indian tribes, and supervise all matters of administrative routine; the Intendant to preside at the Council, exercise independent legislative

and judicial power, and supervise the expenditure of all public moneys, besides acting virtually as a spy on the Governor; and the Supreme Council, composed of the Governor, the Intendant, the Bishop, and five, later seven, and still later thirteen, councilors, to issue decrees for the government of the colony in civil and fiscal affairs, and to sit in judgment on various civil and criminal causes. The distinctive features of the government of Canada throughout the French régime were absolutism and paternalism, the individual settler being robbed of all initiative and forced to look for everything to the general Government, which habitually intervened in the most trivial affairs of every-day life. During the period of royal control, the celebrated feudal system of Canada, first established by Richelieu, and based, with important modifications, upon the system which had obtained in ancient France, took definite form. Large grants, called *seignories*, were made to men of rank or prominence, known as *seigneurs*, who held, in many cases directly from the Crown, by the 'tenure of faith and homage,' and who, in turn, made smaller grants to the *habitants* or *censitaires*, whose tenure rested upon their payment of annual rentals in money or produce, and in some cases upon their rendering to their over-lords certain feudal services, such, for instance, as the *corvée*. The settlements, called *côtes*, were almost uniformly made along streams, the houses being built in long lines, instead of being arranged around a common centre, as was the case in many of the New England villages—each *habitant* receiving a narrow strip of land, fronting on a river or creek and extending for a considerable distance to the rear. The system was not interfered with at the time of the English conquest in 1760, and survived in Lower Canada (Quebec) until 1854, when it was finally abolished.

With the English Colonists to the south the inhabitants of New France came into conflict during the last part of the Seventeenth Century. Such events as the destruction of the French settlement at Port Royal by Argall in 1613, or the capture and occupation of Quebec by David Kirke in 1629-32 may be regarded as sporadic; but with the outbreak of the first of the so-called French and Indian wars in 1689, the long contest between the French and English for supremacy in North America was initiated. (See KING WILLIAM'S WAR; QUEEN ANNE'S WAR; KING GEORGE'S WAR; FRENCH AND INDIAN WAR.) Of these wars, the first two especially, 1689-97 and 1702-13, may be differentiated from the last as being essentially the fighting out of European quarrels on American soil. On the part of the French, the conflict took the form of sudden raids, with the help of their Indian allies, on the frontier settlements of New York and New England. Though no important victory was gained on either side, the English nevertheless acquired by the Treaty of Utrecht (1713) Acadia, Newfoundland, and the Hudson Bay Territory. Thirty-five years of peace followed, marked by rapid development both among the French and the English. The tide of English colonization, breaking through the passes of the Alleghanies, was checked by the French, who had made themselves masters of the great rivers of the west. The war which broke out in 1754 was essentially American, and though it later merged into the greater struggle

of the Seven Years' War, the stake between England and France was the mastery in America. In the French and Indian War, Canada experienced both the advantages and disadvantages of the absolute system of government under which it lived. Against the armies of Great Britain, weakened by incapacity on the part of their commanders and constant friction between British officers and the Colonials, it presented a force of trained fighters, under officers, for the most part, acquainted with the nature of the country, and acting all under the direction of one supreme will. This would account for the ill success of the English during the first part of the war. When it came, however, to a test of endurance between the combatants, Canada, with its sparse population of fur traders and forest rangers, could never hope to hold out against the English Colonists, if, as was the fact, it was forced to depend for help on distant France, with the British holding the mastery of the seas. The capture of Quebec by Wolfe in September, 1759, practically ended the war. By the Treaty of Paris (q.v.) in 1763, Canada, together with all the territory between the Alleghanies and the Mississippi River, claimed by France, was ceded to Great Britain.

Canada was under a military government from 1760 to 1764, and under a sort of provisional government, organized in pursuance of a proclamation by George III., from 1764 to 1774, when the British Parliament passed an important measure known as 'The Quebec Act' (q.v.), which extended the province to the Ohio and Mississippi rivers, provided that Roman Catholics should not be interfered with in their religion, intrusted the administration of affairs to a Governor and a Legislative Council appointed by the Crown, and formally recognized the old civil laws and civil institutions of French Canada, though the English criminal laws were to be in force throughout the province. During the American Revolution, the Continental Congress attempted to secure the active alliance of Canada, and to that end sent a commission, made up of Franklin, Chase, Charles Carroll, and John Carroll, to Quebec; but the province remained loyal throughout, and at the close of the war its population was augmented by the immigration from the United States of between 30,000 and 40,000 Loyalists, whose advent, says the Canadian historian Bourinot, "was the saving of British interests in the great region which England still happily retained in North America." It was these immigrants who founded New Brunswick and Upper Canada (Ontario), and their descendants have continued to the present day to constitute perhaps the most important and influential element in the population of Canada.

By the treaty of 1783, the area of Canada, as established by the Quebec Act, was reduced by the formal relinquishment to the United States of the territory now constituting the States of Wisconsin, Michigan, Ohio, Indiana, and Illinois, and in 1791 the province was divided by the so-called 'Constitutional Act' into two sections, 'Upper Canada' and 'Lower Canada,' the former of which, then having a population of about 20,000, was inhabited almost entirely by men of English descent, and the latter, then having a population of about 125,000, largely by men of French descent. Each sec-

tion was to have a Legislative Council, to be appointed by the King, for life; an assembly, to be chosen by a popular vote; and a Governor and Executive Council, to be appointed by the King; while French institutions were for the most part to obtain in the one and English institutions in the other. The so-called 'Maritime Provinces'—New Brunswick, Nova Scotia, Cape Breton, and Prince Edward Island—were placed under administrations very similar to that of Upper Canada. In Lower Canada a party of discontent almost immediately arose, and until the reorganization of the Government, in 1841, there was almost continual friction between the Popular Assembly on the one side, representing the French element, and the Governor and Legislative Council on the other, representing almost exclusively the English element. In spite of the unifying influence of the War of 1812 with the United States (see UNITED STATES, *History*), in which men of all races throughout Canada participated, this racial antagonism became more and more accentuated, until, in 1837, a certain element of the French population, under the leadership of Louis J. Papineau (q.v.), angered by the intervention of the British Government, rose in revolt against the British authority, but were quickly suppressed.

Meanwhile in Upper Canada much discontent was caused by the political dominance of a small class, descended from the Loyalists, and united, it was charged, under an alleged 'family compact' for the purpose of monopolizing the public offices. The popular dissatisfaction with the prevailing state of affairs was greatly increased by religious antagonisms and by the exposure, through the agency of one Robert Gourlay, of apparent frauds in the disposition of public lands. In 1837, also, the more radical of the reformers, doubtless encouraged by the outbreak in Lower Canada, organized a 'rebellion,' under the leadership of William L. Mackenzie (q.v.), but were defeated and driven out of the province before the close of the following year. Meanwhile Lord Durham had been sent out from England as Governor-General and high commissioner "for the determining of certain important questions depending in the provinces of Upper and Lower Canada, respecting the form and future government of the said provinces," and, largely as a result of the famous report made by him in 1839, the two provinces were reunited, in 1841, by an act of Parliament, which provided for a Governor, to be appointed by the Crown, a Legislative Council, also to be appointed (for life) by the Crown; a Legislative Assembly, to which Upper and Lower Canada were to send an equal number of representatives, to be elected by popular vote; and an Executive Council, or Cabinet, to be chosen by the Governor from the Legislative Council and the Legislative Assembly. The Maritime Provinces, meanwhile, retained their separate governments.

After the union of Upper and Lower Canada, the advantages of a federal union of all the provinces became more and more apparent, especially since, by reason of the plan of equal representation, and the unequal growth of the two united provinces, a reorganization of some kind was rendered imperative. In 1864 a convention of delegates representing the various provinces was held at Quebec for the purpose of considering

the advisability of union, and under the leadership of Sir John Macdonald (q.v.) formally adopted a set of resolutions, which served as the basis for the Act of Union passed by the British Parliament in February, 1867. Under this act, the provisions of which are given in another part of this article, Upper and Lower Canada, Nova Scotia, and New Brunswick were formally united as the Dominion of Canada, which subsequently—in 1871 and 1873, respectively—received the accession of British Columbia and Prince Edward Island. Newfoundland, however, refused to enter the union, and still continues to hold herself aloof. The vast territory which since 1670 had been under the control of the Hudson Bay Company, was acquired by the Dominion in 1869—an event which provoked an uprising, along the Red River, of the half-breeds under Louis Riel (q.v.), and in 1870 this territory was subdivided into Manitoba, which was immediately admitted into the Dominion on equal terms with the other provinces, and the Northwest Territories, out of which districts were subsequently created as follows: Keewatin, in 1876; and Assiniboia, Saskatchewan, Alberta, and Athabasca, in 1882. The principal events since the creation of the federation in 1867, in addition to those already mentioned, have been the raids of the Fenians in 1870-71, who had also made a desultory attack in 1866 (see FENIANS); the adoption of a high customs tariff in 1876; a second outbreak of the half-breeds and Indians under Riel in 1885; the completion of the Canadian Pacific Railroad in the same year; and the agitation in Newfoundland (1887-91) over encroachments by French fishermen.

The boundary line between Canada and the United States, which was determined with considerable vagueness by the treaty of 1783, has formed the subject of much controversy between the United States and Great Britain, and was not finally settled for the northeast until 1842, and for the northwest until 1846. The question of the right of the Americans to fish in Canadian waters has also been the subject of considerable controversy between the two governments (see FISHERIES), as has also the right of the Canadians to participate in the seal fisheries in Bering Sea (see BERING SEA CONTROVERSY). From 1854 to 1866 there was a reciprocity treaty with regard to trade and commerce between Canada and the United States, and since its repeal frequent attempts without avail have been made by the Canadian Government to secure its renewal.
